Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.3, p.L191-3 (March 1983). $In_{1-x}Ga_xAs_yP_{1-y}$ ($0.5 \leq x \leq 0.9$, $0 \leq y \leq 0.55$) layers have been grown on GaAs substrates by low-pressure organometallic vapour phase epitaxy using triethylindium (TEIn), triethylgallium (TEGa), arsine (AsH $_3$) and phosphine (PH $_3$). The surface morphology of the layers is mirror-like and the photoluminescence intensity is comparable to that of InGaP grown on GaAs by the same technique. The relationship between the fraction of AsH $_3$ flow and the solid fraction of As, y, is also mentioned. (9 refs.)

63167 Comparative studies of reactive sputtering, ion plating and CVD coating of TiN hard layers. H.Freller, H.Hassler, H.Schreiner (Siemens AG, Erlangen, Germany).

High Temp.-High Pressures (GB), vol.14, no.3, p.335-40 (1982). (10th Plansee Seminar on 'Trends in Refractory Metals, Hardmetals, and Special Materials, and their Technology', Reutte, Austria, 1-5 June 1981).

CVD techniques have been successfully applied to the coating of tools and structural parts for some years now. For certain applications, however, coating temperatures of around 1000°C, typical of the CVD process, are too high. For this reason an attempt has been made to deposit titanium nitride hard coatings by PVD methods; ion plating and sputtering. Because of the appreciably lower deposition temperatures, 200-400 °C, and the different way the compound forms, the structure of such coatings differs from that of CVD coatings. These were investigated by optical microscopy, scanning electron microscopy, and Vickers hardness measurements. In addition, the influence of specimen geometry on film thickness and film quality is briefly discussed. (5 refs.)

63168 CVD coating of hard metals, especially with regard to boron and boron-containing substances. K.Voigt, H.Westphal (DDR/VEB Hartmetallwerk Immelborn, Immelborn/Thuringen, Germany).

High Temp.-High Pressures (GB), vol.14, no.3, p.357-62 (1982). (10th Plansee Seminar on 'Trends in Refractory Metals, Hardmetals, and Special Materials, and their Technology', Reutte, Austria, 1-5 June 1981).

The possibilities of depositing hard materials containing boron on hard metal parts by the CVD technique are examined. A process has been developed which combined deposition of boron-containing hard layers with hardening of the base material in the zone adjacent to the coating. A CVD plant with a cold-wall retort has been found suitable for carrying out the coating. (11 refs.)

63169 Analysis of silicon crystal growth using low pressure chemical vapour deposition. F.Hottier, R.Cadoret (Labs. d'Electronique et de Phys. Appliquee, Limeil-Brevannes, France).

J. Cryst. Growth (Netherlands), vol.61, no.2, p.245-58 (March 1983).

The growth kinetics of silicon films deposited under low pressure conditions (Si-SiH $_4$ system) have been investigated by using an experimental reactor. Depending on the growth conditions, polycrystalline or monocrystalline films were obtained with different deposition kinetics. With the help of an ultra high vacuum chamber—equipped with surface analysis facilities—which was directly connected to the reactor chamber, a detailed assessment of the growth interface has been made. As shown by in situ ellipsometry, heating the substrate at a temperature higher than 900°C under an hydrogen flow induced a thermal etching of silicon which could be counterbalanced by a low silicon partial pressure. The stable state of growth for polycrystalline or monocrystalline film was also assessed by ellipsometry and additional information concerning the crystallinity or the crystal surface coverage of adsorbed molecules (mainly hydrogen) was obtained by using RHEED and AES techniques. (27 refs.)

63170 Mechanisms of silicon monocrystalline growth from SiH $_4$ /H $_2$ at reduced pressures. R.Cadoret (Lab. de Cristallographie et Phys. des Milieux Condenses, UER Sci., Aubiere, France), F.Hottier.

J. Cryst. Growth (Netherlands), vol.61, no.2, p.259-74 (March 1983).

The kinetics of monocrystalline Si deposition on slightly misoriented {111} Si substrates from SiH $_4$ diluted in H $_2$ at reduced pressures is theoretically analysed in terms of a condensation process of Si atoms and SiH $_4$ molecules, taking surface diffusion into account. The possibility of a homogeneous nucleation is considered by applying the classical homogeneous nucleation theory to published experimental results. A growth mechanism limited by diffusion of SiH $_4$ molecules on a surface inhibited by H absorption is in agreement with the growth rates of monocrystalline Si observed at reduced pressures, when the heated substrate has a surface that is not too large. A condensation of SiH $_4$ molecules explains the homogeneous nucleation. (26 refs.)

63171 Vapour growth of argyrodite-type ionic conductors Cu_2PS_4Hal . S.Fiechter, J.Eckstein, R.Nitsche (Kristallographisches Inst., Univ. Freiburg, Freiburg, Germany).

J. Cryst. Growth (Netherlands), vol.61, no.2, p.275-83 (March 1983).

Cu_2PS_4Hal compounds (with Hal=Cl, Br or I) have been crystallized around 950K by CVT with P, S and Hal (and combinations thereof). Chemical insight into the transport processes was gained from dissociation pressure measurements and spectroscopic vapour analysis. Lacking thermochemical data of the compounds were obtained from C_p measurements. Models, derived for the CVT mechanisms, yield transport rates and directions which agree qualitatively with experiments. The main vapour species (for Hal=Cl) are $PSCl_3$, S_2 , PCL_3 , P_2S_3 and $(CuCl)_3$. With a surplus of CuHal, VLS growth via liquid CuHal/ Cu_2S phases was observed. (13 refs.)

63172 Preparation of oriented GaAs bicrystal layers by vapor-phase epitaxy using lateral overgrowth. J.P.Salerno, R.W.Clelland, P.Vohl, J.C.C.Fan, W.Macropoulos, C.O.Bozler (Lincoln Lab., MIT, Lexington, MA, USA), A.F.Witt.

Grain Boundaries in Semiconductors. Proceedings of the Materials Research Society Annual Meeting, Boston, MA, USA, Nov. 1981 (New York, USA: North-Holland 1982), p.77-82

Describes a novel technique that utilizes vapor-phase epitaxy to grow bicrystal semiconductor layers with predetermined rotation axis, misorientation angle, and grain boundary plane. The geometrical structure of the grain boundary in each layer is therefore completely specified. The technique has been demonstrated by using the AsCl $_3$ -GaAs-H $_2$ method to grow a series of GaAs bicrystals, each containing a [110] tilt boundary formed by a grain with a (111)B boundary plane and a grain rotated from (111)B by a selected misorientation angle. The results of initial electrical measurements indicate that the height

of the potential barrier associated with each grain boundary varies with the misorientation angle. (14 refs.)

81.15J Ion plating and other vapour deposition

63173 Deposition of TiB₂ layers from the gas phase. F.Zeman, J.Mayerhofer, A.Kulmburg (Vereinigte Edelstahlwerke AG, Kapfenberg, Austria). *High Temp.-High Pressures (GB)*, vol.14, no.3, p.341-50 (1982). In German. (10th Plansee Seminar on 'Trends in Refractory Metals, Hardmetals, and Special Materials, and their Technology', Reutte, Austria, 1-5 June 1981). The deposition of TiB₂ layers at various temperatures on uncoated and TiC-precoated cemented carbide was investigated. The deposition rate increases with increasing temperature. In a hot-wall reactor, which was used for the study, the concentration of components used in the reaction decreases, which causes a decrease of the deposition rate at temperatures above 800°C. Uncoated cemented carbide reacts with boron present in the vapour phase, with the formation of a ternary CoWB phase. In the presence of a TiC coating acting as a diffusion barrier this phase is not observed. The crystallographic orientation of the TiB₂ deposits depends on the deposition temperature. (8 refs.)

63174 In-situ monitor of ion beam film growth and etching. P.R.Brosious, D.M.DeCain, J.M.E.Harper, A.W.Kleinsasser (IBM Corp., Armonk, NY, USA).

IBM Tech. Disclosure Bull. (USA), vol.25, no.9, p.4625-6 (Feb. 1983). Describes how positioning a quartz crystal film thickness monitor in the ion beam path, identically with wafers to be processed, permits a dynamic monitoring of film thickness on the wafers as the film is grown and etched. (no refs.)

63175 Large diameter plasma for ion plating of large volume. J.Uramoto (Inst. of Plasma Phys., Nagoya Univ., Aichi, Japan).

J. Vac. Soc. Jpn. (Japan), vol.25, no.12, p.781-7 (1982). In Japanese. First, a large diameter plasma with a uniform density (above 10 cm¹⁸) is produced in a DC discharge by utilizing a magnetic field composed of a circular ferrite permanent magnet and usual magnetic coil, whose magnetic field guides the DC discharge through two intermediate electrodes from a cathode to a large cylindrical anode and is reduced abruptly in the anode region to guide the discharge quickly toward the radial direction. Next, in order to apply this plasma source for the ion plating of large spaces the large diameter plasma is focused in a short distance on a hearth by arranging another permanent magnet under the hearth, while the cylindrical large diameter anode is floated electrically and the DC discharge power is almost concentrated to the hearth. Thus, one can utilize a high density plasma region over a large space of ion plating in comparison with an ordinary method in which only a diffusional plasma region from a small plasma column is used. (8 refs.)

63176 Preparation of molybdenum silicide films by RF ion plating. I.Okada (Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).

J. Vac. Soc. Jpn. (Japan), vol.25, no.12, p.795-801 (1982). In Japanese. Thin films of molybdenum silicide were deposited on oxidized silicon wafers by RF ion plating. Molybdenum and silicon were supplied by electron beam evaporation and SiH₄ gas, respectively. Argon gas was used for the stabilization of the glow discharge. The Si/Mo atomic ratio in the film was changed from 1.4 to 2 by controlling the Mo evaporation rate. The effects of deposition condition, substrate potential, on film properties were investigated by X-ray diffraction analysis, sheet resistance and stress measurements. It was found that the films deposited at -2 kV substrate potential are polycrystalline partly before annealing and change to be polycrystalline wholly after annealing for 5 min at 1000°C. The annealed films show good adhesion to oxidized silicon, low resistivity, and low film stress. (7 refs.)

63177 Novel plasma chemical methods for doping a-Si:H. G.H.Bauer, G.Bilger (Inst. fuer Phys. Elektronik, Univ. Stuttgart, Stuttgart, Germany). Fourth E.C. Photovoltaic Solar Energy Conference, Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.773-7

Hydrogenated amorphous silicon prepared by decomposition of silane in a DC-glow discharge or by RF-sputtering in Ar/H₂ mixtures has been doped by methods of dopants injection into the plasma which base on interactions of plasma or the neutral gas with surfaces at different temperatures and varying electric potentials (co-sputtering, DC-sputtering, thermally activated injection to the neutral gas, plasma assisted transport). By these techniques various kinds of dopants (In, B, P, Sb and N) have been injected into the plasma and by this means incorporated into the film partially acting as electronically active donors and acceptors respectively. Analyses of doping effects and efficiencies by evaluation of temperature dependent conductivity and thermoelectric power data yield increases in room temperature conductivity up to a factor 10⁸ (to ≈10⁻² (Ωcm)⁻¹) and decreases of activation energies for extended states conduction which indicate the position of the Fermi level to <0.2 eV. 81.15L Deposition from liquid phases (melts and solutions)

63178 LPE growth of uniform (Ga, Al)P alloy crystal. T.Sugiura, A.Tanaka, H.Unno, T.Sukegawa (Res. Inst. of Electronics, Shizuoka Univ., Shizuoka, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.3, p.541 (March 1983).

One of the difficulties in the solution growth of (Ga, Al)P alloy crystals is the control of uniformity of Al concentration in epitaxial layers. This is due to the high segregation coefficient of Al from Ga solution. In order to avoid this problem, an Al source which keeps the melt composition constant during growth is necessary. Although AIP is an ideal source of Al, the grade of commercially available AIP is low (3N). The authors describe an experimental study obtaining a uniform (Ga, Al)P epitaxial layer by a temperature difference method with AlAs (5N) and AlSb (6N) as Al source. (2 refs.)

63179 Thickness of GaP liquid phase epitaxial layers grown by step-cooling, equilibrium-cooling, and ramp-cooling methods. Y.C.Kao, O.Eknoyan (Electrical Engng. Dept., Texas A&M Univ., College Station, TX, USA).

J. Appl. Phys. (USA), vol.54, no.4, p.1865-7 (April 1983). Using three different cooling processes, a series of liquid phase epitaxial growth experiments for GaP are performed to determine layer thickness, Δ , as a function of growth time, t , and amount of supercooling temperature, Δ . Comparison is made with layer thickness predictions that are derived from a diffusion-controlled model. Good agreement is obtained for growth times, t , less than the diffusion time, τ , of solute in the melt. The results indicate that, in addition to GaAs and InP, the diffusion-controlled model generally provides good predictions for liquid phase-epitaxial grown GaP layers thickness as well. (10 refs.)

63180 Reproducibility of low carrier concentration in LPE InP using batch melts. S.Yamazaki, K.Nakajima, T.Takanohashi, Y.Kishi, K.Akita (Semiconductor Materials Lab., Fujitsu Labs. Ltd., Kawasaki, Japan).

J. Cryst. Growth (Netherlands), vol.61, no.2, p.289-94 (March 1983).

A useful and practical method for obtaining n-InP layers with low carrier concentrations by liquid phase epitaxy is presented. This method combines batch preparation of growth melts with compensation of residual donors by the p-type dopant Cd, and needs no long-term baking of the melts. The carrier concentrations could be easily controlled in the range of $n=1.0 \times 10^{13}$ - 1.0×10^{16} cm⁻³ by varying the amounts of Cd in the batch-prepared melts. Good reproducibility of $n=(4.5 \pm 1.3) \times 10^{15}$ cm⁻³ has been obtained for 13 growth runs using the same kind of melts. Good uniformity of the carrier concentrations in n-InP layers was found within a wafer and along the growth direction. (13 refs.)

63181 A solution growth technique for the preparation of copper(II) selenide thin films. A.Mondal, P.Pramanik (Dept. of Chem., Indian Inst. of Technol., Kharagpur, India).

J. Solid State Chem. (USA), vol.47, no.1, p.81-3 (15 March 1983).

A solution growth technique has been developed for the deposition of thin films of copper(II) selenide on glass substrates using a copper(II) salt solution, triethanolamine, ammonia, and sodium selenosulfate as the reacting agents. The materials have been characterized through X-ray powder photography, optical absorption, and Hall measurements at room temperature. The films are found to be degenerate and p type with a Moss-Burstein shifted direct band gap of 2.14 eV. (9 refs.)

63182 LPE growth of YNd-iron garnet films for magneto-optical waveguides. T.Okuda, N.Koshizuka, K.Ando (Electrotech. Lab., Ibaraki, Japan).

J. Magn. & Magn. Mater. (Netherlands), vol.35, no.1-3, p.164-6 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).

(YNd)₃Fe₂O₁₂ films for magneto-optical waveguides were successfully grown by liquid phase epitaxy. Both a segregation coefficient of Nd and a growth temperature dependence of the film lattice expansion due to Pb incorporation were determined. The optical phase-matching could be achieved by the precise control of the growth temperature together with that of the thickness. (9 refs.)

63183 Increased-strength black chromium coatings. N.V.Andreeva, V.S.Filimonov.

Sov. J. Opt. Technol. (USA), vol.49, no.8, p.506-7 (Aug. 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.8, p.33-5 (Aug. 1982). [received: April 1983]

A method is proposed for the periodic layer-by-layer desorption of black chromium in an electrolytic bath having a moving anode. The developed procedures make it possible to improve significantly the physical and mechanical characteristics of the coating, and they can be recommended for producing increased-thickness decorative coatings. (9 refs.)

63184 Deposition of cadmium chalcogenide thin films by a solution growth technique using triethanolamine as a complexing agent. A.Mondal (Dept. of Chem., Indian Inst. of Technol., Kharagpur, India), T.K.Chaudhuri, P.Pramanik.

Sol. Energy Mater. (Netherlands), vol.7, no.4, p.431-8 (Jan.-Feb. 1983).

A method has been developed for the chemical deposition of thin films of CdS and CdSe on glass substrate. For CdS deposition, a triethanolamine complex of cadmium ions, ammonia and thiourea solutions were used, while for CdSe films, sodium selenosulfate solution replaced thiourea, other reagents remaining unchanged. Variation of thickness with different bath parameters have been studied to obtain thickest deposition possible. X-ray characterization optical absorption and photoconductivity measurements have been performed to confirm the deposition of CdS and CdSe. Triethanolamine has been found to be useful complexing agent for the deposition of chalcogenide thin films. (14 refs.)

63185 Epitaxial growth of ZnO layers—a new aspect in homojunction models of ZnO varistors. I.Baumgartner, R.Einzinger (Res. Labs., Siemens AG, Munich, Germany).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.367-71

A powder mixture of bismuth oxide and a zinc antimony spinel phase of formula Zn₇Sb₂O₁₂ was sandwiched between two polished pellets of ZnO ceramics, heated at 1000°C for one hour, and subsequently cooled. The experiment shows that during the cooling period an epitaxial layer of ZnO is formed on the surface of the pellet substrate. By doping the ceramics with cobalt oxide this ZnO layer can be distinguished by optical and X-ray investigations. Considering the defect equilibrium in ZnO the epitaxial layers should be less conductive than the sintered ceramics. This may play an important role in the establishment of potential barriers initiating the varistor effect. (6 refs.)

81.20 OTHER METHODS OF PREPARATION OF MATERIALS

- 63186 General characteristics of flows formed during spinning of chemical fibres. W.Kalita, J.Lubinski, A.Szaniawski (Inst. Podstawowych Problemow Techniki, Acad. of Sci., Warszawa, Poland). *Polim. Tworzywa Wielkocząsteczkowe (Poland)*, vol.27, no.8, p.305-8 (Aug. 1982). In Polish. [received: March 1983]

The authors treat general characteristics of flows, independent of the structural details, in the bulk of bundles of formed chemical fibres. The bulk (interior) of the bundles has been treated as an anisotropic and deformable filtration medium. Some practical conclusions resulting from a global analysis of such streams have been presented. (11 refs.)

- 63187 Critical technology limits to silicon material and sheet production. M.H.Leipold (California Inst. of Technol., Jet Propulsion Lab., Pasadena, CA, USA).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.985-9

The reduction in scope of the Flat-Plate Solar Array Project has resulted in sharply focusing the developments within the programs involving silicon material and silicon sheet production. This has been accomplished by limiting the research to those elements which have the most impact on the long-term potential of each process under development. Silicon material development efforts include two approaches. The first involves the production of high purity silane and conversion to silicon particles in a fluidized-bed reactor. Here the critical element is the performance of the fluidized-bed reactor, specifically minimizing fines production and wall deposits and demonstrating purity. In the second, the dichlorosilane process, wall deposits in the rod reactor are limiting the conversion of dichlorosilane to silicon. Sheet preparation efforts involving Czochralski growth and wafering have largely been eliminated accompanied by reduction in casting development. Within ribbon development, the most critical elements here are reduction of ribbon stress and maintenance of flatness during high speed growth. Secondary efforts in improving conversion efficiency continue. (9 refs.)

- 63188 Some physicochemical aspects of $\text{Pd}-\text{PdO}-\text{Ag}$ -glass mixture sintering. I.Barycka, A.Misiuk (Inst. of Electronic Technol., Tech. Univ. of Wrocław, Wrocław, Poland).

Mater. Sci. (Poland), vol.7, no.4, p.467-74 (1981).

Transformations in sequentially annealed $\text{Pd}-\text{PdO}-\text{Ag}$ -glass samples with closely adjoining crystalline particles were investigated. Solid state processes were described by a series of chemical reactions being strongly dependent on sample preparation method. Relative amounts of Pd , PdO and Ag as well as the composition of the $\text{Pd}-\text{Ag}$ solid solution are dependent on the temperature and time of heating. Main crystalline constituents of samples heated above 700K were $\text{Pd}-\text{Ag}$ solid solution and PdO . It was stated that considerable amounts of silver can pass to the amorphous phase. (5 refs.)

- 63189 Theoretical investigation of the transverse pressing of particulate materials. II. Pressure and density distribution in the seat of deformation in transverse pressing with axial prepressing. G.M.Zhdanovich, V.A.Sidorov, Ch.A.Yakubovskii (Polytech. Inst., Belorussian SSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.8, p.603-7 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.6-10 (Aug. 1982). [received: Feb. 1983]

For pt.1 see *ibid.*, vol.27, no.7, p.8 (1982). The density and pressure distributions in the transverse pressing of powders with axial prepressing are considered. (2 refs.)

- 63190 Experimental investigation of plastic strains of porous solids—a review. V.Z.Midukov, V.D.Rud' (Tomsk Polytech. Inst., Tomsk, USSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.21, no.8, p.607-11 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.10-16 (Aug. 1982). [received: Feb. 1983]

An examination was made of statistically isotropic and microhomogeneous specimens produced by hydrostatic pressing, and special attention given to processes giving rise to small elastic-plastic strains. To obtain valid data, it was necessary to employ methods of preparation of specimens ensuring an even distribution of porosity throughout their volume. A large series of experiments was conducted with the aim of examining the effect of method of preparation of specimens on the uniformity of porosity distribution throughout their volume. Uniformity of density distribution was determined indirectly, by assessing strains in various sections through specimens after repressing by hydrostatic pressure. (21 refs.)

- 63191 Analysis of the stressed state of the forward slip zone in the seat of deformation of a powder being rolled. E.B.Lozhechnikov (Polytech. Inst., Belorussian SSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.8, p.612-16 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.16-21 (Aug. 1982). [received: Feb. 1983]

The problem is considered as a two-dimensional one. The arc of contact of the powder with the rolls is replaced with a chord whose angle of slope in the direction of rolling is $\gamma/2$ (γ is the neutral angle). The parameters of properties of the powder undergoing deformation in the forward slip zone—angle of interparticle friction ϕ , angle of sliding friction of the powder on the roll surfaces ϕ_r , and cohesion of the powder c —are assumed to be constant. (11 refs.)

- 63192 Contemporary development of the science of sintering. M.M.Ristic (Belgrade Univ., Belgrade, Yugoslavia).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.1-15

The author reviews various models and concludes that a thorough analysis both of the modern development and state of the science of sintering points to the fact that fundamental investigations are based on an atomistic view of structure. Numerous attempts to analyse the principal mechanism of sintering phenomena have been made, but on models, only. Therefore particular attention should be paid to those endeavours striving to solve the problem of simultaneous action of two or more mechanisms. (55 refs.)

- 63193 Recent developments in the theoretical analysis of solid state sintering. D.L.Johnson (Northwestern Univ., Evanston, IL, USA).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.17-26

Numerical approaches of previous authors are reviewed with particular reference to sintering diagrams and nonisothermal simulations. It is concluded that the sintering models do not adequately predict nor describe sintering. The simple sintering models and maps do not take enough account of multiple mechanisms. (44 refs.)

- 63194 Liquid phase and activated sintering. G.Petzow, W.A.Kaysser, M.Amtenbrink (Max-Planck-Inst. für Metall., Stuttgart, Germany).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.27-36

The present state of liquid phase and activated sintering is considered. It is shown that the present theory of liquid phase sintering and its quantitative treatment have to be modified considerably if recent observations of a number of elementary mechanisms, such as particle disintegration, Ostwald ripening with shape accommodation and directional grain growth are to be taken into account. For activated sintering, new experimental results on nickel doped molybdenum powder compacts indicate that dislocation networks and sub-boundaries are preserved during the process of heating to the sintering temperature, which are not observed in compacts without nickel. Features which are common to liquid phase and activated sintering are particle rearrangement and directional grain growth. The latter phenomenon is further discussed on the basis of ideas regarding solid-solid and solid-liquid interfaces. (33 refs.)

- 63195 Statistical theory of sintering and microstructure evolution. G.C.Kuczynski (Univ. of Notre Dame, Notre Dame, IN, USA).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.37-44

Using statistical methods, a set of relationships among the measurable parameters describing the microstructure in a porous body, is developed. It has been shown that these parameters are always proportional to the porosity raised to some function of a single parameter x which in turn is a function of pore size distribution. In some cases x is also a function of diffusion coefficients of the transport processes involved. (11 refs.)

- 63196 Percolation theory approach to sintering. J.Kertész (Inst. for Theoretical Phys., Univ. of Cologne, Köln, Germany), T.Vicsek.

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.53-9

The importance of collective phenomena in sintering is pointed out. The percolation model is briefly reviewed and the problem of percolation on a lattice and off a lattice is discussed in the light of Monte Carlo calculations. The percolation model is suggested to describe: (i) the insulator-conductor transition of the powder, (ii) the powder-solid transition, (iii) the microcrack structure of compacted and sintered materials, (iv) the network of the voids through which the additives evaporate during sintering. Monte Carlo calculations were carried out on some two and three dimensional percolation models. The possible application of the directed percolation to the description of the rupture of compacts is studied. The critical volume fraction of voids remaining among the intersecting spheres, where an infinite connected path through voids appears was determined. The theory of gas-permeability is discussed and points of view are given for avoiding the swelling of rods during sintering. (20 refs.)

- 63197 High-sensitivity dilatometric setup for investigation of sintering of high-melting compounds in controlled atmospheres. V.N.Klimenko, E.M.Petrova, V.A.Masljuk (Inst. for Materials Sci., Problems Acad. of Sci., Kiev, Ukrainian SSR).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.127-32

The design of a setup for investigating with a high accuracy the process of an 'active' sintering of high-melting material powders is described. The setup allows investigations to be conducted under isothermal and non-isothermal conditions over a temperature range of 20 to 2500°C in vacuum or inert gas atmospheres at heating rates from 0.08 to 1 deg.s⁻¹. The accuracy of measuring the variations in specimen dimensions in sintering is within 0.5%. A high efficiency of the developed setup in investigating the 'superplasticity' of high-melting powder materials is shown by way of example of sintering tungsten-nickel powder specimens. (8 refs.)

- 63198 The use of solid solution additives in sintering. R.J.Brook, S.P.Howlett, Su Xing Wu (Dept. of Ceramics, Univ. of Leeds, Leeds, England).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.135-44

Additives have proved to be one of the most effective ways of achieving high density in the solid state sintering of ceramic powders. Although many mechanisms can be proposed for the function of additives, there are few examples where an unambiguous interpretation of a particular mechanism has been achieved. The mechanisms are briefly reviewed together with rules for additive selection; it is argued that, since the broad function of the additive is to increase the ratio of densification rate to grain growth rate, the influence on both terms should be considered. Data on ZrO_2 and CoO are presented in the discussion. (15 refs.)

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.145-51

Concerns powder metallurgy and ceramic products in which a chemical reaction takes place during sintering. Sintering and reaction models are reviewed. (17 refs.)

- 63200 Interfacial segregation and enhanced sintering processes.** R.M.German (Materials Engng. Dept., Rensselaer Polytech. Inst., Troy, NY, USA). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.177-83.
The sintering process during the intermediate stage is viewed as a competition between densification, grain growth and pore rounding events. From a practical viewpoint it is most desirable to enhance densification while suppressing pore rounding and grain growth. To examine this problem, a mathematical model is constructed with a view towards enhanced sintering. Specific attention is given to interfacial segregation effects on grain growth and sintering; segregated solutes change the boundary cohesive energy, diffusivity and mobility. Analysis is focused on solutes which segregate to boundaries, increase the cohesive energy, lower the boundary mobility while providing high diffusivity transport paths. It is shown that diffusivity to mobility ratios over approximately 2×10^9 N/m² leads to enhanced sintering densification. (30 refs.)
- 63201 Diffusion processes in sintering of multicomponent systems.** P.A.Vitiaz (Powder Metall. Assoc., Minsk, USSR). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.263-8.
A method for model investigation of diffusion processes in sintering of highly dense materials obtained by mixing powders with different chemical content has been developed. The method gives a precise account of concentration relations of self-diffusion and interdiffusion coefficients and includes numerical solution algorithms for diffusion equations, structure models of sintered steels and computer programs with information output in the form of histograms of concentration distributions. The method allows determination of principle phenomena of homogenization kinetics of materials produced from powder mixtures of iron and nickel or steel with high chromium content. (6 refs.)

- 63202 Studies on fabrication of superconducting V₃Ga wires.** S.B.Sastry, K.Subba Ramaiah (Dept. of Phys., Indian Inst. of Technol., Madras, India). *Indian J. Cryog.*, vol.7, no.3, p.135-9 (1982).
A review of methods of processing V₃Ga wires through the surface diffusion process (SDP) and composite processes are presented. V₃Ga tapes wound in the form of pancakes were tested in magnetic fields up to 18.0 T. The multifilamentary wires made by the composite process have been studied in external magnetic fields up to 20.8 T. Effects of addition of impurities like Si, Ge, Au, Bi, Mn, Zr etc. have also been studied and reported in literature. Attempts being made in the authors' laboratory to process V₃Ga wires through the surface diffusion process are presented. Further studies planned on these wires are indicated. (11 refs.)
- 63203 Some studies in the displacements of powder material during compaction.** J.Duszczyk (Inst. of Precision & Electronic Engng., Tech. Univ. of Warsaw, Warsaw, Poland). *Powder Technol. (Switzerland)*, vol.34, no.1, p.57-68 (Jan.-Feb. 1983).
On the basis of the results of tribological investigations during the compaction of iron powder type NC.100.24 and of the distribution of porosity in sintered compacts, the character of powder material displacements was described for the last stage of compaction, i.e. after establishment of a preset compacting pressure. In those investigations, the model used was of the compaction of a powder material in a rotary die. The choice of such a model results from the necessity of programming an experiment with a more complex state of stresses within the mixed powder being compacted than that in standard static compaction. Decisive conditions are determined for depth of penetration of shearing stresses in the compacted material, as well as conditions of change of the state of friction of the compact against the stationary mandrel surface from static to kinetic friction. (23 refs.)
- 63204 Sintered boron—production and properties. I. Investigation of the sintering of boron.** R.A.Andrievskii, I.A.Bairamashvili, Yu.I.Solev, V.V.Khromonozhkin. *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.21, no.8, p.622-7 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.27-32 (Aug. 1982). [received: Feb. 1983].
The starting boron (β -modification) powder used was produced by annealing [1970-1980°C, vacuum corresponding to $1.3 \times (10^{-2}-10^{-3})$ Pa] electrolytic amorphous boron. Commination of the annealed powder was effected by ultrasonic milling. X-ray phase analysis was performed, using a DRON-0.5 apparatus, at angles ranging from 8 to 26°, which enabled the greatest changes in reflections to be obtained. Mean particle sizes after milling were assessed by the usual gas-permeability method of specific surface measurement. (15 refs.)
- 63205 Effect of thermal conditions of preparation of dispersion-strengthened nickel powders on the character of distribution of the strengthening phase.** B.N.Babich, A.A.Fofanov. *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.21, no.8, p.637-9 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.43-6 (Aug. 1982). [received: Feb. 1983].
It was found that thermal conditions of treatment of oxide powders produced by chemical coprecipitation exert a pronounced influence on the mechanical properties of semifinished products of dispersion-strengthened nickel made from these powders. Raising the calcining temperature of such oxide powders activates particle redistribution processes and has an adverse effect on the uniformity of distribution of the strengthening phase, which leads to the formation of large particles in the subsequent stages of plastic working and heat treatment of the powders and a steady deterioration in the mechanical properties of semifinished products. (9 refs.)
- 63206 General aspects for the optimization of pressing and sintering conditions of copper compacts.** H.Schreiner, R.Tusche (Div. for Technol., Central Div., Siemens AG, Erlangen, Germany). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.45-51.
Solid state sintering of compacts made from dendritic copper powder has been studied in dependence upon compacting pressure and sintering temperature by means of dilatometrical measurements. With regard to high density in the sintered state these parameters must be suitably chosen in order to avoid a decrease in density by an overlapping swelling effect. Within the range of the compacting pressure of P=500 MPa up to P=800 MPa and sintering temperatures of T_S>1010K a decrease in density was always observed even in the

case of stepwise sintering. With $P=400$ MPa and $T_S=1123$ K, however, a continuous increase in density of the compacts was obtained. The microstructure of high pressed copper compacts showed intensive power coalescence after sintering; at the lower compacting pressure rounded, single pores with considerably lower total volume are dominant. (6 refs.)

63207 The influence of particle size on intermediate and final stages of molybdenum sintering. D.Uskokovic, B.Novakovic, V.Petrovic, M.M.Ristic (Inst. of Tech. Sci., Serbian Acad. of Sci. & Arts, Beograd, Yugoslavia). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.69-74.
The influence of initial particle size on kinetics of molybdenum sintering was investigated. Three fractions of monodispersed molybdenum powder (2, 5 and 10 μ m) were used as well as a polydispersed powder with mean particle size of 12 μ m. Decrease in particle size accelerates to a great extent densification and grain growth processes. During sintering of 10 μ m powder and to a smaller extent in the case of polydispersed powder, Zener's relation was confirmed. Quantitative equations for the intermediate sintering stages could not be fitted to the investigated particulate systems, even though the grain growth process could be described by cubic law and though the volume diffusion coefficient and the surface energy were known with great reliability. (8 refs.)

63208 Some magnetological insights in the consolidation of metal powders. D.Dzevic, A.Kirin, A.Bonefacic (Electrotech. Inst. Rade Koncar, Univ. of Zagreb, Zagreb, Yugoslavia). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.85-90.
Coercivity, retentivity, conductivity and X-ray diffraction measurements were performed on cobalt green compacts in the pressure range 0-660 MPa. Well pronounced property and anisotropy, respectively directions parallel and normal to the pressing action direction, is discussed. Mean internal stresses in compacts, assessed from magnetometry data, reach 400 MPa at highest pressure applied and are in reasonable agreement with stress values computed by using X-ray diffraction data. Crystallite size data and stacking fault probabilities are also considered. (18 refs.)

63209 Geometric and structural aspects of sintering of model and real systems. P.Lanyi, W.Hermel (Zentralinst. fur Festkorperphys., und Werkstoffforschung, Akad. der Wissenschaften, Dresden, Germany). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.91-9.
A theoretical concept discussing the sintering as a problem of geometric and structural changes and their interactions is demonstrated. On the base of this concept an idea of the solid-state sintering of metallic one-component systems is formed which enables the sintering behaviour to be interpreted from a uniform point of view. The considerations refer to the early stages of sintering. Diffusion-dependent transport mechanisms are assumed to prevail. (9 refs.)

63210 Observations on dimensional changes during sintering of Al-Cu compacts. W.Kehl, H.Fischmeister (Austrian School of Mines, Leoben, Austria). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.269-74.
Dilatometric measurements of the swelling and shrinkage of Al-Cu compacts during sintering are combined with metallographic and fractographic observations in order to elucidate the processes responsible for the dimensional changes during liquid phase sintering. (2 refs.)

63211 Influence of Ni-additions on grain boundaries during sintering of Mo. W.A.Kayser, M.Amentbrink, G.Petzow (Max-Planck-Inst. fur Metall., Inst. fur Werkstoffwissenschaften, Stuttgart, Germany). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.275-82.
The shrinkage and the formation of a solid solution of Ni in Ni-doped Mo compacts pressed at different pressures were determined after sintering by heating at different rates and immediately cooling and by sintering isothermally. The phenomena were correlated with each other and with observation by TEM of the dislocation structure of the compacts. The dislocations appear to accelerate both formation of solid solutions and shrinkage. (5 refs.)

63212 Effect of alloying additions on sintering of iron-phosphorous pre-mixes. G.S.Upadhyaya, M.Hamuddin (Dept. of Metall. Engng., Indian Inst. of Technol., Kanpur, India). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.291-8.
A comparative study of the effect of copper, nickel, or molybdenum (0-4% each) on the sintering behaviour of iron containing phosphorous (0-0.6%) has been made. The sintering was done at 1200°C for 1 hr in dry hydrogen. It was observed that copper decreases shrinkage, while nickel or molybdenum addition increases. The results have been discussed on the basis of liquid phase sintering and the generalised electronic model proposed by Samsonov (1973). (15 refs.)

63213 Sintering of cast iron swarf powder and Fe-Si-C mixed powder. Z.Hara, K.Akechi, K.Hanawa (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.299-304.
The variation of graphite morphology with C content and its effects on tensile strength by using Fe-Si-C mixed powders is investigated. The products containing about 1%C, sintered for a long time or powder forged, showed high tensile strength, because graphite was nodularised. The products containing more than 2%C, however, showed inferior tensile strength, because graphite reveals a powder particle boundary morphology. These results were explained in terms of the gas-bubble theory; C atoms supersaturating in γ phase precipitate as graphite into pores in the sintered products. Further experiments were carried out to confirm the gas-bubble theory. The pore-containing white cast iron was produced from cast iron powder compacts by rapid melting and solidifying using a resistance sintering machine. Nodular graphite was formed during annealing of the pore-containing white cast iron but not in the case of pore-free white cast iron. (6 refs.)

63214 Particle growth by coalescence during liquid phase sintering of Fe-Cu. W.A.Kayser, S.Takajo, G.Petzow (Max-Planck-Inst. fur Metall., Inst. fur Werkstoffwissenschaften, Stuttgart, Germany). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.321-7.
The contribution of particle coalescence to the particle growth during liquid phase sintering of Fe-Cu was investigated. Particle contacts involving grain boundaries with low energy, i.e. with large dihedral angles, were frequently observed. By means of electron channelling pattern investigations on the analogous system Cu-Ag, such low energy grain boundaries were proved to be low-indexed coincidence boundaries. With the assumption that particle coalescence following the low energy boundary formation mainly contributes to particle growth, the growth behaviours were treated generally on a statistical basis and then correlated to the special case of Fe-Cu. Average particle sizes and particle size distributions were calculated and compared with experimental results. It was found that coalescence contributes significantly to particle growth. (10 refs.)

63215 Structure formation in chromium carbide alloy of eutectic type during sintering. V.P.Chepeleva (Inst. of Superhard Materials, Acad. of Sci., Ukrainian SSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.21, no.8, p.647-50 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.55-9 (Aug. 1982). [received: Feb. 1983]

Structure formation was studied in a typical chromium carbide alloy—a composite consisting of Kh18N15 (18% Cr-15% Ni) austenitic stainless steel and chromium carbide. Kh18N15 steel and chromium carbide (Cr_7C_3) powders of 1- to 10- μ m particle size were mixed together, pressed (porosity ~50%), and sintered for 0.5, 1.0, 1.25, 1.5, and 2.5 h in a vacuum furnace at 1280°C. Sintered specimens were examined metallographically and subjected to X-ray phase analysis and electron probe microanalyses. (7 refs.)

63216 Effect of the combined carbon of tungsten monocarbide on the reaction of diamond with a hard metal. D.Kh.Bronstein (Inst. of Superhard Materials, Acad. of Sci., Ukrainian SSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.21, no.8, p.650-4 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.59-64 (Aug. 1982). [received: Feb. 1983]

It was found that to minimize the degree of reaction of diamonds with a hard metal during the production of diamond-containing composites and at the same time preserve a strong bond between the diamond grains and the matrix material, it is necessary to ensure that the deficiency of combined carbon in the tungsten monocarbide compared with the stoichiometric composition does not exceed 0.10-0.15 wt.%. In this way, on the one hand a strong adhesion bond is allowed to form at the diamond/matrix interfaces and, on the other, the 'expenditure' of diamond in the impregnation of the WC with carbon is reduced to a minimum. (16 refs.)

63217 Regularities in formation of composite materials by impregnation of dispersive diamond structures with metal melts. Yu.V.Naidich, G.P.Volk, I.A.Lavrienco (Inst. for Problems of Materials Sci., Kiev, Ukrainian SSR). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.305-9.
Presents some investigations on the kinetics of metal melt impregnation of the layer of diamond particles and the process of wetting the diamond with metal liquid associated with it. The materials investigated were synthetic diamond powders of various grades and grain sizes and a copper-base nickel-manganese alloy with a melting point of $980 \pm 20^\circ\text{C}$. (5 refs.)

63218 Grain growth of tungsten fibres in a W-Ni composite during solid and liquid phase sintering. L.Kozma (Res. Inst. for Tech. Phys., Hungarian Acad. of Sci., Budapest, Hungary), E.Th.Henig. Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.313-20.
The influence of nickel on the microstructural changes of tungsten wire drawn to high strain has been studied during sintering in the range 1350 to 2200K. It was found that the deformed structure of the as-drawn wires can be easily penetrated by Ni. According to the annealing temperature, two different microstructural changes and mechanisms of material rearrangement have been observed. Solid phase sintering (<1730) can activate only the recrystallisation leading to equiaxial grain morphology (activated recrystallisation). At higher temperature the liquid Ni attacks the fibre boundaries resulting in disintegration of the wire into elementary particles, which is followed by a complete dissolution of the fibres and reprecipitation (liquid phase sintering). The metallographic sections of the annealed material show large spherical particles embedded in the matrix. (16 refs.)

81.20L Ceramics and refractories

63219 On reactions between silicon and nitrogen. I. Mechanisms. H.M.Jennings (Dept. of Metall. & Materials Sci., Imperial Coll. of Sci. & Technol., London, England). *J. Mater. Sci. (GB)*, vol.18, no.4, p.951-67 (April 1983).

An attempt is made to rationalize various reaction mechanisms for the formation of Si_3N_4 from gaseous nitrogen and solid silicon. It is suggested that a

fundamental difference between α - and β - Si_3N_4 is that the former results from silicon complexing with molecular nitrogen and the latter results from complexing with essentially atomic nitrogen. Well established mechanisms (as well as controversial ones) are analysed in the light of this difference and are shown to be operative under various reaction conditions. The influence of some common reaction variables are interpreted with respect to their influence on either silicon or nitrogen or both. (84 refs.)

63220 Microstructure formation in wurtzite BN (Geksanit-R) sinterings. S.S.Dzhamarov, A.V.Kurdyumov, G.S.Oleinik, N.F.Ostrovskaya, A.N.Pilyankevich, A.V.Bochko (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.21, no.8, p.627-31 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.32-7 (Aug. 1982). [received: Feb. 1983]

It is concluded that the loading of wurtzite boron nitride to high static pressures (55-100 kbar) under room temperature conditions is accompanied by the processes of comminution of polycrystalline powder particles and their monocrystalline grains. Comminution of wurtzite boron nitride particles and grains has been found to take place also during sintering at high pressures and temperatures. The intensity of particle and grain comminution during loading and compression grows with increasing size of the particles in the starting condition. The comminution of particles and grains has a marked effect on structure formation in polycrystalline Geksanit-R alloy sintering. (6 refs.)

63221 Radiation-thermal sintering of europium oxide. A.P.Voronin, V.A.Neronov, V.V.Boldyrev, T.F.Melekova, V.L.Auslender, V.V.Aleksandrov, N.Z.Lyakhov, V.A.Polyakov, M.A.Savinkina (Inst. of Solid State Chem. & Ore Processing, Acad. of Sci., USSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.8, p.632-6 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.38-42 (Aug. 1982). [received: Feb. 1983]

Investigates whether the RT effect can occur in high-temperature mass transport involving no chemical stage. As an example of such a process a study was made of the RT sintering of europium oxide, Eu_2O_3 , at 1323-1773K. A powder grade Eu_2O_3 of the low-temperature modification, covering a range of particle sizes, was used. Sintering experiments were carried out on europium oxide with and without 0.1-1.0% TiO_2 doping additions. Titania was introduced by mechanical mixing in such a way that no further comminution occurred. (7 refs.)

63222 Effect of low-temperature ferritization on the properties of ferrite powders. A.I.Antoshchuk, I.N.Barkova, G.I.Kamornina, B.I.Morozov, G.S.Podval'nykh, V.I.Rogachev, V.A.Tkachenko (Ivano-Frankovsk Inst. of Petroleum & Gas, USSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.8, p.665-8 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.76-80 (Aug. 1982). [received: Feb. 1983]

A description is given of a method of preparation of a ferrite charge in which vibratory milling is performed at 400-650°C in an oxidizing atmosphere. This enables the milling and diffusional annealing operations to be combined, which has a marked effect on the charge ferritization process. The charge temperature falls from 800-1000 to 400-650°C, and the process is therefore known as low-temperature ferritization (LTF). A mixture of starting components of composition (%) 85.4 Fe_2O_3 , 7.55 Li_2CO_3 , 5.25 MnCO_3 , and 1.8 MgO was subjected to thermal vibratory treatment at a frequency of 25 Hz in a specially constructed apparatus. The quality of heat treatment of powders was assessed by their specific saturation magnetization intensity, specific surface, and compressibility indicator. (5 refs.)

63223 Nonstoichiometry and physical properties of hot-pressed manganese-zinc ferrites. V.P.Pashchenko, Yu.A.Bykov, S.N.Mikharskii, E.I.Osyka, P.P.Kirichok, I.M.Marchenko, O.R.Yatsura, T.Ya.Galavura. *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.21, no.8, p.669-3 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.80-5 (Aug. 1982). [received: Feb. 1983]

It is concluded that changing the pressure in the hot pressing of manganese-zinc ferrites affects both the composition and state of the solid-phase system and the structural characteristics of specimens. With a rise in hot-pressing pressure, the Fe^{2+} concentration, density, Curie temperature, and degree of inversion increase; there is also a tendency for the initial magnetic permeability to fall and for the crystallite size to grow. An interrelationship is shown to exist between the Fe^{2+} content of manganese-zinc ferrite spinel and the degrees of nonstoichiometry and inversion. (14 refs.)

63224 Reaction of powdered superhard materials with gases during high-temperature shock compression. G.I.Savvak, B.V.Fenochka (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.8, p.673-6 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.85-9 (Aug. 1982). [received: Feb. 1983]

Investigates the reaction of gases with SHM powders crystallizing during high-temperature shock compression under various conditions, resulting in different degrees of deviation of the starting phase toward instability. A mass-spectrometric study was made of the products of reaction of diamond and diamondlike boron nitride phases with hydrogen and other reducing gases. The intense reaction of SHM powders with gases observed not only during the transformation of material by shock compression into a gaseous phase and plasma but also in the solid phase suggests that in principle it should be possible to employ high-temperature shock compression for assembling by chemical means SHMs with controlled amounts of alloying components. (12 refs.)

63225 Kinetics and mechanism of sintering of covalent-ionic compounds. P.S.Kisly, M.A.Kuzenkova (Inst. for Superhard Materials, Acad. of Sci., Kiev, Ukrainian SSR).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.61-8

The process of sintering of refractory nonmetallic compounds is not yet studied sufficiently. The experimental data show that mass transfer in RCI (refractory covalent-ionic) compounds is mainly determined by the processes of destruction at high temperatures. RCI compounds melting without marked decomposition, such as aluminium nitride and boron nitride, are sintered in the region of premelting temperatures, whose contraction is effectively activated by using dispersion powders and of nonstoichiometric composition. RCI compounds which intensively decompose on heating, such as nitrides of boron and silicon, are sintered at high premelting temperatures as well, although only under the pressure of nitrogen exceeding the pressure of dissociation. (8 refs.)

63226 Surface energy of silicate melts and its importance in sintering processes. L.Zagar, O.E.Klinger, W.Stumpe, K.Lower (Inst. fur Gesteinskundkunde, RWTH, Aachen, Germany).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.73-84

The significance of the surface energy in relation to the sintering process is considered. The viscous flow, volume diffusion, surface diffusion, evaporation, condensation and, shrinkage of an isolated pore are examined. The sessile drop method and bubble pressure method of measurement are explained. (7 refs.)

63227 Comparison between theory and experiment in the sintering of undoped MgO . G.Tomandl, A.Stiegelschmitt (Inst. fur Werkstoffwissenschaften, Erlangen, Germany).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.101-6

Undoped MgO was sintered at temperatures from 1500 to 1800°C and times from 8 to 960 minutes. Using semiautomatic image analysis, particle size distributions were determined. These distributions were compared with theoretical functions obtained by a numerical solution of the differential equations according to a theory by Oel (1969). Within the experimental errors, which are discussed in detail, a correspondence could be found. A simplified method is shown for the determination of the velocity constant. (2 refs.)

63228 Sintering of magnesium-oxide obtained from sea water. B.Petric, N.Petric, N.Bogdanic, M.Mirosevic-Anzulovic.

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.107-19

Presents the results obtained from examination of sintering of magnesium oxide p.a. and magnesium oxide obtained from sea water by nonstoichiometric and over-stoichiometric precipitation with dolomite lime. The density and apparent porosity were examined in order to determine the structure of the sintered samples. The examinations have been carried out by optical microscopy and electron microscopy, i.e. scanning. (7 refs.)

63229 Sintering and devitrification of slip-cast fused silica. D.Kicevic, M.Gasic (Materials Sci. Dept., Boris Kidric Inst. for Nuclear Sci., Belgrade, Yugoslavia).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.121-6

Sintering and devitrification of slip-cast commercial fused silica during firing in air were followed by density, compressive strength and X-ray diffraction determination. The influence of both firing temperature and time upon the fired samples properties was investigated using factorial design of experiments. Other influencing parameters, such as particle size distribution, solid phase content in slip, pH, slip viscosity and slip-casting conditions, were kept constant. Empirical mathematical models of properties dependence on influencing factor were established and discussed in terms of simultaneous effect of influencing factors and optimal conditions of obtaining dense, strong and thermally stable samples. (9 refs.)

63230 Investigation of MgO doped $\gamma\text{-Al}_2\text{O}_3$ sintering. J.Katanic-Popovic, M.Gasic, D.Kicevic (Boris Kidric Inst. for Nuclear Sci., Belgrade, Yugoslavia).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.153-8

The properties of $\gamma\text{-Al}_2\text{O}_3$, $\gamma\text{-Al}_2\text{O}_3$ with 1.5% MgO and spinel formed in equimolar mixture of Al_2O_3 and MgO powders fired at 550°C, were analysed. The sintering of catalyst supports made from $\gamma\text{-Al}_2\text{O}_3$ and $\gamma\text{-Al}_2\text{O}_3$ with 1.5% MgO in the temperature interval from 600° to 800°C was followed by density, porosity and specific surface measurements and compressive strength as well as microstructure determination. The sintering process in the temperature interval 600°-800°C was manifested by specific surface area decrease (with activation energy of 2.5 10^4 Jmol⁻¹), and pore size distribution change. The increase of pore radii with sintering temperature is more intensive process in samples with 1.5% MgO addition. (5 refs.)

63231 Effects of magnesium compound additives on sintering of magnesia. K.Hamano, Z.Nakagawa, H.Watanabe (Res. Lab. of Engng. Materials, Tokyo Inst. of Technol., Yokohama, Japan).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.159-64

The authors have examined the effect of magnesium compounds on sintering of magnesia, that is, the cation of additives is the same as that of the host oxide. For the additives, seven magnesium compounds were selected, and mixed with magnesium hydroxide in the ratio of 4 and 5 wt.% calculated as MgO . The mixtures were calcined and from which specimens were prepared by isostatic compression with pressure of 1000 kg/cm², then fired at 1400°C for 0-4 h. Sintering behaviour and microstructure of the fired specimens were examined. From the results obtained, it was concluded that the addition of various magnesium compounds showed markedly different effects on sintering of magnesia, though they have the same cation, Mg. Particularly in the case of addition of magnesium chloride, uniform sized and well crystallized periclase grains were formed during the calcination. Therefore green density of their specimens became very high and then dense fired bodies were obtained. For example, body having 98% theoretical density was obtained by firing at temperature of as low as 1400°C. (2 refs.)

63232 Sintering kinetics of Al_2O_3 doped with MgNb_2O_6 . G.Wroblewska (Glass & Ceramics Inst., Warsaw, Poland).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.165-71

The sintering process of Al_2O_3 with 0.1-1.5 mol.% MgNb_2O_6 was investigated. It has been found that with MgNb_2O_6 content in an amount of 0.5 mol.%, a material featuring 0.96 of theoretical density can be obtained after sintering at 1500°C. The dependence of linear shrinkage on sintering temperature and dopant concentration was studied. MgNb_2O_6 was found to decompose in the process of sintering. This is accompanied by the formation of a new compound, AlNbO_4 , which occurs in the structure of material besides the Al_2O_3 crystallites. (7 refs.)

63233 Sintering of SYNROC: case history for phase formation and densification of complex oxide systems. H.Palmour, III, T.M.Hare (North Carolina State Univ., Raleigh, NC, USA).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.185-92

Addresses several closely interwoven topics relating to the sintering of SYNROC, a potential ceramic waste form for disposal of high level radioactive

waste (HLW). SYNROC is an acronym (SYNthetic ROCK) first used in 1978 by Ringwood to describe his then-emergent concept of very durable, and hence very disposable, man-made crystalline ceramic waste forms for stabilization of HLW. SYNROC compositions are based on naturally-occurring titanate/zirconate minerals which are known to accommodate within their crystal structures a variety of naturally occurring radioactive species and to have endured within the deep earth environment for geologically long times. It has been argued that by thus emulating nature and forming synthetic rocks from these same very stable mineral assemblages, man can reliably expect to convert man-made HLW to earth-stable ceramic forms and thereafter to store them indefinitely, deep (>2000 m) within suitable geologic formations (granite, basalt, etc.). Since its introduction, the SYNROC concept has attracted considerable research attention in a number of locales in Australia and the US, with both defense and power wastes being considered. (33 refs.)

63234 Reactive sintering in the BaO:ZrO₂ 1:1 system. J.Brzezinska, K.Haberko, R.Pampuch (Inst. of Materials Sci., AGH, Cracow, Poland). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.193-202. Evolution of the pore system and of morphology on calcination and sintering of powders obtained by coprecipitation from chloride aqueous solutions. Water and ethanol as washing media give rise to two types of agglomerates which differ in morphology and phase composition that determine two types of behaviour observed. With alcohol-washed systems dense BaZrO₃ may be obtained at 1773K. (24 refs.)

63235 Shrinkage and initial grain growth in BaTiO₃ ceramics. H.Schmelz (Siemens Res. Labs., Munich, Germany). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.203-7. In order to understand microstructure development in BaTiO₃, the beginning of sintering was investigated. The temperature of shrinkage onset was found to be more than 100K below the eutectic point as determined by DTA. Both points depend on the chemical composition. The magnitude of the temperature difference between these two points leads to the conclusion that initial grain growth and shrinkage are controlled by solid state diffusion. In BaTiO₃ with SiO₂ impurities, an additional shrinkage mechanism by a direct influence of liquid phases is assumed. (3 refs.)

63236 Sintering of multiphase ceramics. P.Reynen, A.C.Firatli (Inst. für Geisteswissenschaften, Aachen, Germany). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.209-18. Two compositions in the ternary system MgO-Al₂O₃-ZrO₂ were used in sintering experiments. Investigation of polished sections by SEM revealed a very uniform distribution of phases. It was concluded that multiphase ceramics show good sintering behaviour because discontinuous grain growth is inhibited. Full density with small grains could not be realised however due to parasitic pore growth. (9 refs.)

63237 Sintering of beta alumina powders obtained by sol-gel process. Preliminary studies. A.Deptula (Inst. of Nuclear Res., Warsaw, Poland), C.Majani, A.di Bartolomeo, M.Carewska. Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.219-26. The Al₂O₃ powders of spherical shape doped with Na₂O, MgO and Li₂O were obtained by sol-gel process. The temperature of calcination (500°C to 750°C) of powders and the temperature of sintering (1300°C to 1560°C) of pellets were varied to determine the optimum conditions to obtain β' alumina. (17 refs.)

63238 Sintering of ZrO₂-CaO and ZrO₂-Y₂O₃ powders obtained by sol-gel process. C.Majani (Centro di Studi Nucleari della Casaccia, CNEN, Roma, Italy), A.Deptula, M.Carewska, A.di Bartolomeo, R.Przytycka. Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.227-37. ZrO₂-CaO and ZrO₂-Y₂O₃ powders were obtained by sol-gel process. The temperature of calcination (400-1000°C) of powders, the time (8 to 48 hr) and the temperature of pellets' sinterization were varied to determine the optimum conditions to achieve the solid-solutions ZrO₂-CaO and ZrO₂-Y₂O₃. (24 refs.)

63239 Reactions and sintering of ZrO₂-doped spinel. J.Wallace, T.Kosmac, N.Claussen (Max-Planck-Inst. für Metall., Stuttgart, Germany). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.239-44. The effect of 1000 ppm ZrO₂ dopants on the reaction and sintering of three different spinel compositions, stoichiometric, Al₂O₃-rich and MgO-rich, was studied in a recording dilatometer using a constant heating rate. The small ZrO₂ additions dropped the initial reaction temperature of all mixtures approximately 75°C due to the formation of cation vacancies. The powder composition did not affect the initial reaction temperature. The stoichiometry of the powder mixtures greatly influenced the sintering rate of the resulting spinel mixtures and the degree of the effect of ZrO₂ on the sintering rate; samples with excess MgO sintered very rapidly compared to the stoichiometric and Al₂O₃-rich composition. The 1000 ppm ZrO₂ additions greatly hindered the sintering rate of the MgO-rich samples but had much less effect on the stoichiometric and Al₂O₃-rich bodies. (13 refs.)

63240 The influence of the liquid phase amount on the densification of Si₃N₄-base ceramics. S.Boskovic ('Boris Kidric' Inst. of Nuclear Sci., Belgrade, Yugoslavia). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.245-50. Processes taking place during sintering of Si₃N₄-base ceramics were investigated in the system Si₃N₄-YAG-β 60. It was found out that reaction occurs at 1450°C giving sialon as a reaction product. The influence of liquid phase amount on the densification, reaction and microstructure was discussed. (5 refs.)

63241 Some aspects of transient liquid phase sintering. S.J.Kiss, D.Cerovic, E.Kostic (Boris Kidric Inst. of Nuclear Sci., Vinca, Yugoslavia). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.251-6. Some aspects of reaction sintering of Al₂O₃-SiO₂ and Al₂O₃-MgO mixtures in the presence of forsterite-cordierite-protonstatite eutectic were investigated. It was found out that heating rate up to 1450°C influenced the sintered samples

properties, as a consequence of different physico-chemical characteristics of the systems developed during heating up period. (9 refs.)

63242 The grain growth in alumina derived from gels. Lj.M.Zivkovic, M.M.Ristic (Electronic Faculty, Univ. of Nis, Beograd, Yugoslavia). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.257-62. The grain growth of a gel-alumina was investigated and the effects on grain growth and densification of small additions of silica-gel were studied. For comparison purposes the behaviour of pure alpha-alumina under same conditions was investigated. From the grain size measurements using the classical grain growth law the constant n of grain boundary migration was evaluated. (6 refs.)

63243 Growth of isolated macropores in a silica ceramic. D.D.Gramatikov, M.I.Milosevski, M.M.Ristic (Serbian Acad. of Sci. & Arts, Beograd, Yugoslavia). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.329-34. The pores growing in a silica ceramic have been studied. The physical parameters which characterise this process have been determined. The process is carried out via two stages. The first stage is characterised as reaction sintering, but in the second stage a liquid phase appears. (3 refs.)

63244 The effect of MgO on intragranular pore entrapment in sintered aluminium oxide. J.E.Burke, S.Prochazka (General Electric Corporate Res. & Dev., Schenectady, NY, USA). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.335-41. It has long been known that less than 0.05% MgO will prevent discontinuous grain growth and entrapment of pores inside grains of sintering aluminium oxide. An early thesis was that magnesium adsorbed at the grain boundaries reduced grain boundary mobility and prevented the breakaway from pores during grain growth that occurs in pure alumina. Workers using Auger spectroscopy have been unable to detect excess magnesium at grain boundaries of sintered alumina and this has led to the rejection of the adsorption hypothesis and the suggestion of competing models. It is demonstrated that the MgO addition does not increase pore mobility and does reduce grain boundary mobility which supports the original hypothesis. (15 refs.)

63245 Development of the microstructure of semiconducting BaTiO₃ ceramics. K.Lubitz (Res. Labs., Siemens AG, Munich, Germany). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.343-8. The microstructure of semiconducting BaTiO₃ ceramics develops as the result of secondary recrystallisation. A small amount of reactive melt-eutectic BaTiO₃-Ba₂Ti₇O₄₀ with the eutectic temperature $\vartheta_E \approx 1320^\circ\text{C}$ —is present in the ceramic and makes a process of dissolution and recrystallization. The grain size of the fired ceramic is determined by the nucleation. The response of BaTiO₃ to firing is studied with reference to the system BaTi_{1-x}Nb_xO₃+yTiO₂ (x≤0.05; y≤0.5). The way in which nucleation is influenced by the excess TiO₂, the doping concentration and the heating rate during firing is discussed. The grain size is controlled within broad limits by varying the heating rate near the eutectic temperature ϑ_E . (11 refs.)

63246 Grain growth in doped-undoped ceramic BaTiO₃ couples. B.Hoffmann (Inst. für Technol. Elektrotech., Univ. Karlsruhe, Karlsruhe, Germany), D.Hennings, M.Klerk. Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.349-54. Diffusion couples of La doped BaTiO₃ and undoped BaTiO₃ were heated from 10 min to 56 h at 1400°C. The couples were investigated after heating by means of light microscopy and electron microprobe analysis. Depending on the Ti/Ba atomic ratio on each side of the couple, different regions of exaggerated grain growth were observed. The thickness, position and chemical composition of such regions were studied. (5 refs.)

63247 Grain boundaries in sintered carbides. R.A.Andrievsky (Moscow Inst. of Fine Chem. Technol., Moscow, USSR). Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.355-9. Grain boundaries in sintered and hot-pressed samples of zirconium and tungsten carbides were studied with aid of X-ray microanalysis and other physical methods. The localisation of silicon, cobalt, iron in the grain-boundary regions was found. (7 refs.)

63248 Microstructural changes at grain boundaries during sintering of doped BaTiO₃ ceramics with small additions of TiO₂. M.Drofenik, S.Pejovnik, L.Irmanecnik (I. Stefan Inst., Kardelj, Univ., Ljubljana, Yugoslavia), I.Mochnik, V.Krasevec. Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.361-6. Doped and undoped BaTiO₃+4 mol% TiO₂ ceramics have been investigated by SEM, TEM and TGA with respect to the duration time of sintering. It was found that rapid grain growth in an early stage of sintering is associated with the release of oxygen and the presence of a liquid phase. In the later stage of sintering the liquid phase runs out of the samples while precipitation of second phases decorates grain boundaries. (5 refs.)

63249 Short-time sintering of hard metals. W.Hermel, R.Krumphold, G.Leitner (Zentralinst. für Festkörperphys. und Werkstoffforschung, Akad. der Wissenschaften, Dresden, Germany), K.Voigt. *High Temp.-High Pressures (GB)*, vol.14, no.3, p.351-6 (1982). (10th Plansee Seminar on 'Trends in Refractory Metals, Hardmetals, and Special Materials, and their Technology', Reutte, Austria, 1-5 June 1981). Short-time sintering by induction heating leads in a number of cases to considerable economies of time and energy, and increased output. Results of

development work on the applicability of short-time induction sintering to hard metals are described. The investigations, which concentrated on the influence of sintering time and temperature, show that in the case of commercial WC-Co and WC-TiC-Co hard metals, sintering times of a few minutes only are sufficient to attain properties which are equivalent to or better than those produced by conventional sintering. A short-time sintering process which uses induction heating has been developed for the production of hard metals. (7 refs.)

63250 The effects of pressure on the carbonization of pitch and pitch/carbon fibre composites. M.A.Forrest, H.Marsh (Northern Carbon Res. Lab., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England). *J. Mater. Sci. (GB)*, vol.18, no.4, p.978-90 (April 1983).

Three pitches which give carbons of varying optical texture have been carbonized singly and with different carbon fibres at pressures in the range 0.1 to 200 MPa. The effect of pressure on the carbonization system is to retard growth and coalescence of the growth units of mesophase, thus reducing the size of the optical texture of the resultant carbon. With increasing pressure botryoidal (spherical) structures are formed. On co-carbonization of pitches with carbon fibres the alignment of the basal planes of the matrix carbon parallel to the fibre length at the fibre/matrix interface is improved within a given pressure range. This range is dependent upon the parent pitch used and is experimentally determined. This effect is seen for all fibre types. (9 refs.)

63251 Thermal effects accompanying the heating of metallized powders. S.R.Pustotina, N.N.Novikov, L.K.Glukhova (Odessa Food Industry Technol. Inst., USSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.8, p.657-61 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.67-72 (Aug. 1982). [received: Feb. 1983]

Assesses the energetic potentialities of thermally reacting alumina, zirconia, and tungsten carbide powders composed of particles covered with aluminum or two-layer aluminum-nickel shells. Composites were prepared by vacuum aluminizing and chemical nickel plating. The thermodynamic characteristics of possible exothermic reactions in the systems under consideration are given. A comparative assessment of the magnitudes of exothermic effects was carried out using an apparatus for the thermographic analysis of powders. (8 refs.)

63252 Sintering in the nickel-alumina system. I.P.Arsentjeva, D.Stefanovic, V.Mikijelj, M.Pavicevic, M.M.Ristic (Centre of Multidisciplinary Study, Belgrade Univ., Belgrade, Yugoslavia).

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.283-9

Describes an investigation of sintering of the Ni-Al₂O₃ system. In the material prepared by a powder metallurgy technique, the bond formed between nickel oxide and α -Al₂O₃ was investigated by means of microprobe analyses and a suggestion was made as to the mechanism of interfacial reactions with alumina. (7 refs.)

63253 Metallographic and structural investigations of levitation splat cooled cobalt base cobalt-refractory carbide alloys. D.Duzevic (Electrotech. Inst. Rade Koncar, Zagreb, Yugoslavia), A.M.Tonejc, V.Krasevec.

Sintering - Theory and Practice. Proceedings of the 5th International Round Table Conference on Sintering, Portoroz, Yugoslavia, 7-10 Sept. 1981 (Amsterdam, Netherlands: Elsevier 1982), p.373-8

Levitation splat cooled Co-10 wt.% TaC and Co-5 wt.% TiC alloys were investigated by metallography, X-ray powder photography and transmission electron microscopy. Considerable hardness and coercivity growth in splat cooled samples, as compared with respective sintered master alloys, have been measured. Different position-dependent stages of carbide precipitation have been observed. (7 refs.)

63254 A lanthanum-tantalum (Al) oxide porous glass ceramic. R.W.White, M.A.Res, J.Bednarik (Nat. Phys. Res. Lab., CSIR, Pretoria, S Africa). *J. Mater. Sci. (GB)*, vol.18, no.4, p.1021-7 (April 1983).

The substitution of the end-member oxides in the ternary glass forming sodium borosilicate system was studied. The replacement of SiO₂ with combinations of La₂O₃ and Ta₂O₅ was found to produce glasses which, after heat treatment decomposed to form a leachable sodium borate phase and an insoluble ceramic phase. The mode of phase decomposition is sensitive to impurities: the importance of crucible selection, e.g. Al₂O₃ or Pt/Rh is demonstrated by resulting differences in pore size, surface area, chemical resistance and structure of the insoluble phase for a series of La₂O₃-Ta₂O₅ and La₂O₃-Ta₂O₅-Al₂O₃ glass ceramic. These new materials have a specific surface area of up to 145 m² g⁻¹ and average pore radii ranging between 0.7 and 28.6 nm and show a varying degree of chemical resistance. (14 refs.)

63256 Interaction of hydrogen with traps and its solubility in maraging steel. V.I.Sarrak, G.A.Filippov, G.G.Kush (Inst. of Metallography & Phys. of Metals, Moscow, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.310-15 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

An investigation was made of the influence of the ageing temperature on the solubility of hydrogen in maraging steel N18K9M5T. A maximum was found of the hydrogen solubility after ageing at 450°C. This solubility maximum was attributed to the formation of hydrogen traps, representing local microstresses that appeared during earlier stages of ageing of coherent intermetallic particles. An estimate was obtained of the energy of the interaction of hydrogen with coherent intermetallic particles (0.4 eV), which was higher than the energy of the interaction of hydrogen with dislocations and titanium atoms. (13 refs.) A.T.

63257 Orientation relationships between BCC Mo and FCC γ in a Ni-Al-Mo-W superalloy. D.M.Dimiduk (AFWAL Materials Lab., Wright-Patterson AFB, OH, USA).

Metal. Trans. A (USA), vol.14A, no.3, p.493-8 (March 1983).

Describes the observed orientation relationships between the alpha (α) phase (Mo+W) and the gamma (γ) matrix after isothermal aging at 930°C for times up to 2000 hours. The alloy used was an experimental P/M Ni-base superalloy prepared by a centrifugal-atomization, forced-convective-cooling technique. (4 refs.)

63258 An investigation of the process of decomposition of the supersaturated solid solution of nitrogen in a niobium alloy. E.V.Vasil'yeva, T.A.Vorobova.

Russ. Metall. (GB), no.6, p.119-24 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.120-5 (1981).

Metallographic, electron-microscope, resistivity and internal-friction investigations were used to examine the relationships governing the decomposition of the saturated solid solution of nitrogen in the niobium alloy MN-1 (wt.% Nb+10 Mo, 3 Ti, 1 Zr). Alloying with nitrogen refines the grain size after heat treatment. Quenching of the nitrated MN-1 alloy freezes the saturated solid solution of nitrogen in the complex-alloyed matrix. The specifics of ageing of this alloy with nitrogen is determined by the decrease in the solubility of nitrogen in the matrix and the presence of alloying elements (Ti, Zr), which have a higher chemical affinity for nitrogen than the base metal. Decomposition of the saturated solid solution during heating in the range 1100-1400°C starts with the separation of metastable-phase particles and formation of nuclei of the stable phase. The latter was experimentally observed at 1200°C and is accompanied by generation of elastic stress fields due to lattice distortion in the matrix surrounding the nitride particles. (9 refs.)

81.30B Phase diagrams of metals and alloys

63259 Phase equilibrium diagram for the vanadium-rhenium system. V.N.Eremenko (Acad. of Sci., Ukrainian SSR), A.M.Kharkova, T.Ya.Velikanova.

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.2, p.72-6 (1983). In Ukrainian.

Using methods of X-ray analysis, optical microscopy, determination of the phase microhardness, Pirani-Altherum initial melting point, differential thermal analysis, determination of the temperature for transition into superconducting state the authors studied the alloy structure of the vanadium-rhenium system and plotted a diagram of the phase equilibrium. σ phase is congruently melted at 2903K, but at 1723[±]25K it undergoes eutectoid decomposition, $\sigma \rightleftharpoons \alpha_1 + \alpha$. A-phase is formed in a solid state $\alpha + \sigma \rightleftharpoons \alpha$ at temperatures ranged between 2223-2473K, but at 1373K it is decomposed following the reaction of $\alpha \rightleftharpoons \alpha_1$. Eutectic equilibrium $L \rightleftharpoons \alpha + \sigma$ takes place at 2853K. At this temperature solubility of the rhenium in vanadium covers a range of 65-69 at.% Re. Solubility limit of vanadium in rhenium is between 86-91 at.% Re at a temperature of 2873K, i.e. the temperature of common phase crystallization of σ and α_1 . $L \rightleftharpoons \sigma + \alpha_1$. (7 refs.)

63260 The Th-Sn phase diagram. S.Cirafici, A.Palenzona, P.Manfrinetti (Istituto di Chimica Fisica, Univ. di Genova, Genoa, Italy).

J. Less-Common Met. (Switzerland), vol.90, no.1, p.49-56 (March 1983).

The Th-Sn system was investigated by means of differential thermal and X-ray analysis and micrograph. Two eutectics are formed at about 80.0 at.% Th and 1.0 at.% Th with characteristic temperatures of 1600°C and 220°C respectively. Four intermetallic compounds (Th₃Sn₂, Th₃Sn₄, ThSn₂, and ThSn₃) were found and the crystal structures of all except ThSn₂ were determined using single-crystal diffractometric data. Th₃Sn₂ melts congruently at 1800°C, whereas ThSn₂ and ThSn₃ decompose peritectically at 1410°C and 955°C respectively. It was impossible to determine the decomposition point of Th₃Sn₄ and the temperature reported in the diagram (1550°C) is an estimated value. No appreciable solid solubility of thorium in tin or of tin in thorium was observed; the four intermediate phases also appear to be line compounds. (13 refs.)

63261 Phase diagrams of binary rare earth metal-indium systems. S.P.Yatsenko, A.A.Semyannikov, H.O.Shakarov, E.G.Fedorova (Inst. of Chem., Acad. of Sci., Sverdlovsk, USSR).

J. Less-Common Met. (Switzerland), vol.90, no.1, p.95-108 (March 1983).

X-ray diffraction, metallography and differential thermal analysis were used to establish the phase diagrams of binary rare earth-indium systems which have not previously been investigated. Some general characteristics of the phase diagrams of these binary systems are reported. (29 refs.)

63262 Solidus and liquidus temperatures in the Cs-Te system. M.G.Adamson, J.E.Leighy (General Electric Co., Vallecitos Nuclear Center, Pleasanton, CA, USA).

J. Nucl. Mater. (Netherlands), vol.114, no.2-3, p.327-9 (Feb. 1983). Reports the results of liquidus and solidus temperature measurements over the composition range 9:1 \geq Cs:Te \geq 1:9 and, on this limited basis, present a tentative high temperature Cs-Te phase diagram. (13 refs.)

63263 Change in the electrical resistivity of Al-3.5% Cu during thermal cycling in the solidus-liquidus range. A.S.Bubenshchikov, Yu.S.Nechayev, L.N.Shekhter.

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.542-4 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.28-30 (Aug. 1982). [received: March 1983]

From the rate of the change in the temperature coefficient of electrical resistivity of Al-3.5% Cu in the solid-liquid state in the temperature range of 590-615°C it was established that individual dislocations can serve as the centers of melting. The activation energy of copper diffusion in aluminum $E=144.4$ kJ/mole. (8 refs.)

63264 The magnetism corner of the Mg-Y-Ce system. M.E.Drits, E.M.Padezhnova, T.V.Dobatkina, E.V.Voyekhova, V.V.Kinzhbalov. *Russ. Metall. (GB)*, no.6, p.200-3 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.206-10 (1981).

The projection of the surfaces of crystallisation is plotted for the system Mg-Y-Ce. The isothermal sections for 500 and 300°C are plotted and the simultaneous solubility of yttrium and cerium in magnesium at these temperatures was determined. (3 refs.)

63265 Phase equilibria in the Mg-Al-Sr system. M.M.Makhmudov, O.I.Bodak, A.V.Vakhobov, T.D.Dzhurayev. *Russ. Metall. (GB)*, no.6, p.209-12 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.216 et. seq. (1981).

The isothermal section was plotted for the Mg-Al-Sr diagram at 673K and wide ranges of solid solutions based on the compounds of the following binary systems were established: Sr_2Mg_{17} , Sr_6Mg_{23} , $SrMg_2$, $SrAl_4$ and $SrAl_2$. (11 refs.)

63266 Stability and crystallization of an amorphous nickel-based alloy. W.Ozgowicz, J.Tyrlík-Held (Inst. de Metall. Phys. et Soudage, Ecole Polytech. Silesienne, Gliwice, Poland), G.Thomas, A.Zahra, J.Le Coze. *Ser. Metall. (USA)*, vol.17, no.3, p.295-8 (March 1983).

Ribbons of the amorphous Ni-base alloy $Ni_{82}Cr_7Fe_5Si_3B_3$ were produced by the chill-block melt spinning method. Differential scanning calorimetry in the temperature range 20-600°C and X-ray diffraction in the range 20-800°C were used to study the crystallisation stages. Stage I, 20°C < T < 450°C, was short range order rearrangement of the glass solution. Stage II, T ≥ 450°C, was crystallisation of the solid solution α from the glass β. The glass transition (T_g) occurs at ~450°C. Stage III, T ~ 550°C, was crystallisation of Ni_3B from β. Stage IV, 550°C < T < 800°C, was the appearance of new, not well defined, phases, Ni_3Si_2 , $Fe_4Si_{18}B_6$ and Fe_3SiB . (15 refs.)

63267 Coupled phase diagram and thermodynamic analysis of the 18 binary systems formed among Li_2CO_3 , K_2CO_3 , Na_2CO_3 , $LiOH$, KOH , $NaOH$, Li_2SO_4 , K_2SO_4 and Na_2SO_4 . C.W.Bale, A.D.Pelton (Dept. de Genie Metall., Ecole Polytech., Montreal, Quebec, Canada).

CALPHAD: Comput. Coupling Phase Diagrams & Thermochem. (GB), vol.6, no.4, p.255-78 (1982).

Available phase diagram and thermodynamic data on the eighteen binary systems containing Li^+ , Na^+ , K^+ , SO_4^{2-} , CO_3^{2-} , and OH^- have been collected and critically assessed. A set of self-consistent thermodynamic parameters describing the free energies of the compounds, solid solutions, and liquid solutions in the binary systems has been formulated. The phase diagrams have been calculated, and estimated error limits of all diagrams are given. (51 refs.)

63268 The As_2S_3 -SnTe system. B.B.Kuliev, A.P.Gurshumov, E.M.Kuliev, Kh.Ya.Khalilov (V.I. Lenin State Pedagogical Inst., Azerbaidzhan SSR). *Inorg. Mater. (USA)*, vol.18, no.5, p.625-8 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.738-41 (May 1982). [received: Feb. 1983]

Reaction has been studied in, and a phase diagram has been constructed for, the As_2S_3 -SnTe system; the system is of the eutectic type, with formation of the compound $SnAs_2S_3Te$, which melts incongruently at 335°C. The eutectic point, found by means of a Tamman triangle, corresponds to an alloy with 25 mole% As_2S_3 at 240°C. The extent of solid solutions based on SnTe is up to about 3 mole% SnTe at room temperature. With slow cooling, a region of vitrification based on As_2S_3 is maintained up to 15 mole% of SnTe. (6 refs.)

63269 Phase equilibrium in the Ti-Se system at high pressures. E.G.Ponyatovskii, B.I.Kazandzhan. *Inorg. Mater. (USA)*, vol.18, no.5, p.630-6 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.745-51 (May 1982). [received: Feb. 1983]

Investigates phase equilibria in the Ti-Se system at high pressures using the DTA method. The phase Ti_3Se begins to melt incongruently with an elevation in pressure. A polymorphic transformation γ - $Ti_3Se \rightarrow \delta$ - Ti_3Se was observed with a small heat of transition and volume change. The authors established the existence of the phase Ti_3Se with a broad region of homogeneity and a very high pressure sensitivity of the melting point (166 K/G Pa), having a polymorphic transformation ϵ - $Ti_3Se \rightarrow \eta$ - Ti_3Se , the temperature of which is sharply reduced with pressure (280 K/G Pa). With an increase in pressure, the evolution of the T-C diagram of the Ti-Se system is determined by the fast-growing dome of congruent melting of Ti_3Se . (10 refs.)

63270 The Te - $Tl_2As_2Te_3$ - Tl_2Te_3 system. V.M.Dmitriev, V.V.Kirilenko, R.N.Shchelokov, V.A.Samokhov, N.G.Velikova (N.S. Kurnakov Inst. of General & Inorganic Chem., Acad. of Sci., USSR).

Inorg. Mater. (USA), vol.18, no.5, p.650-7 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.769-80 (May 1982). [received: Feb. 1983]

The following eight polythermal sections were studied by differential thermal analysis, X-ray diffraction analysis, investigation of the microstructures, and measurements of the microhardnesses: $Tl_2As_2Te_3$ - $TlTe_3$, which is partially quasi-binary, $(Tl_2As_2Te_3)_{0.1}Te_{0.9}$ -($Tl_2As_2Te_3$)_{0.25}(Tl_2Te_3)_{0.75}, Tl_2Te_3 -($Tl_2As_2Te_3$)_{0.118} $Te_{0.882}$, $(Tl_2As_2Te_3)_{0.118}Te_{0.882}$ -($Tl_2As_2Te_3$)_{0.118} $Te_{0.882}$, $(Tl_2As_2Te_3)_{0.118}Te_{0.882}$ -($Tl_2As_2Te_3$)_{0.118} $Te_{0.882}$, Tl_2Te_3 -($Tl_2As_2Te_3$)_{0.57}($Tl_2As_2Te_3$)_{0.429}, and Tl_2Te_3 -($Tl_2As_2Te_3$)_{0.1} $Te_{0.9}$. The temperature and concentration boundaries of the regions of primary crystallization of Te and the α- and β'-solid solutions and the boundaries of the regions of simultaneous crystallization of the components were determined. The Te - $Tl_2As_2Te_3$ - Tl_2Te_3 partial system is characterized by the existence of mono-variant eutectic and peritectic equilibria. Isothermal cross sections of the Te - $Tl_2As_2Te_3$ - Tl_2Te_3 partial system were constructed. (17 refs.)

63271 The Ti - As - Te system. V.M.Dmitriev, V.V.Kirilenko, R.N.Shchelokov, V.A.Samokhov, N.G.Velikova (N.S. Kurnakov Inst. of General & Inorganic Chem., Acad. of Sci., USSR).

Inorg. Mater. (USA), vol.18, no.5, p.658-63 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.781-8 (May 1982). [received: Feb. 1983]

The Ti - As - Te system was analyzed on the basis of experimental data. Most of the errors in the interpretation of the phase diagram of the Ti - As - Te system are due to the incorrect assumption of the existence of the $TiAsTe_3$ ternary compound. One cannot draw conclusions regarding the structure of the phase diagram of the ternary system without a detailed study or at least without a study of all of the quasibinary sections. (19 refs.)

63272 Phase diagram of the $Pb(PO_3)_2$ - MoO_3 system. G.A.Bukhalova, I.V.Mardirosova, N.P.Ocheret (Inst. of Construction Engng., Rostov-on-Don, USSR).

Inorg. Mater. (USA), vol.18, no.6, p.896-8 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1057-9 (June 1982). [received: Feb. 1983]

Presents the results of a study of the phase diagram of the binary $Pb(PO_3)_2$ - MoO_3 system. Lead metaphosphate was synthesized. The melting point of the material obtained was 937K. A cp grade of molybdenum trioxide was used, with $T_m=1069K$. The phase diagram of the $Pb(PO_3)_2$ - MoO_3 system was investigated by differential thermal analysis. The thermography was performed in a pyrometer by plotting the heating curves in states where the alloys had been either forcibly crystallized or had been annealed to reach equilibrium. (8 refs.)

63273 Thermogravimetric study of the $KNbO_3$ - KBO_2 system. L.M.Rudkovskaya, V.G.Smotrakov (Rostov-on-Don State Univ., Rostov-on-Don, USSR).

Inorg. Mater. (USA), vol.18, no.6, p.911-12 (June 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.6, p.1070-1 (June 1982). [received: Feb. 1983]

A thermogravimetric study of the $KNbO_3$ - KBO_2 system was carried out on the Paulik system derivatograph, and its phase diagram was plotted. The studies were carried out at temperatures from room to 1100°C at a heating rate of 10°C/min. The system was studied over the whole concentrations range, and is eutectic. The eutectic contains 73 mole% of KBO_2 and melts at $(860 \pm 5)^\circ C$. (6 refs.)

63274 Multichemistry and microstructure of a multiphase aluminosilicate ceramic. S.H.Risbud (Dept. of Ceramic Engng., Univ. of Illinois, Urbana, IL, USA), A.Zangvil.

J. Mater. Sci. (GB), vol.18, no.4, p.990-1004 (April 1983).

The microstructure and microchemistry of a sintered ($\approx 1700^\circ C$) aluminosilicate ceramic (60 wt.% Al_2O_3 -40 wt.% SiO_2) was investigated by optical, scanning (SEM and EDAX), and analytical electron microscopy (TEM and STEM). The microstructural features of the fired ceramic consisted of unreacted Al_2O_3 glass, porosity, and equilibrium and metastable mullite phases. Residual Al_2O_3 agglomerates (≈ 15 to 30 μm in size) were surrounded by a ≈ 6 μm layer of equilibrium mullite (≈ 71.3 to 73.5 wt.% Al_2O_3). The unreacted Al_2O_3 -equilibrium mullite assembly formed islands embedded in a silica rich glass (≈ 4.5 to 14 wt.% Al_2O_3) which also contained 2 to 3 μm thick metastable mullite needles (≈ 70 to 77 wt.% Al_2O_3). Phase separation and alumina rich glass compositions (≈ 57 to 59 wt.% Al_2O_3) were also observed in some areas of the microstructure. (7 refs.)

63275 Comments on the manuscript entitled: On the existence of a two-phase field in the uranium-oxygen system within the composition range 2.65 < O/U < 2.67 below 1273K (A. Caneiro, J.P. Abriata and J. Garces, J. Nucl. Mater. 113 (1983) 260-262) [and reply]. M.S.Chandrasekharaiah (Chem. Div., BARC, Trombay, Bombay, India).

J. Nucl. Mater. (Netherlands), vol.114, no.2-3, p.326 (Feb. 1983). Chandrasekharaiah comments on a paper by Caneiro et al. in which they state that their observed two-phase field is only during reduction. He suggests that this apparent metastable state is the result of a diffusion-controlled oxidation reaction due to the large sample (1g) used. Caneiro et al. reply maintaining that all plotted data points on isotherm De correspond to well-defined metastable equilibrium states of the U-O system. (1 ref.)

(see also 64.70D Solid-liquid transitions)

63276 Discontinuity of temperature distribution due to phase transformations during the cooling of alloys. T.Sato, K.Ikawa (Dept. of Metal Processing, Tohoku Univ., Sendai, Japan).

Acta Metall. (USA), vol.31, no.5, p.731-41 (May 1983).

Cooling curves have long been used to study phase transformations. The discontinuity in the partial time derivative has been analysed for the case of various transitions. These include liquid-to-solid (passage of dendrite front), liquid- and solid-to-solid (passage of austenite front), and liquid-to-gas- and -solid (passage of a front of pore formation). Application of this theory to cooling curves recorded during the solidification of an Al-6 wt% Cu alloy

revealed the exact moment of passage of the dendrite front, and the temperature of the latter, as well as the rate of increase of the fraction of solid at the thermocouple location. (6 refs.)

63277 Solidification of copper and silver in near-zero-g experiments. V.S.Zemskov, I.N.Belokurova, A.A.Barareko, V.V.Savtychev, N.F.Bogdanova (Baikov Inst. of Metall., Acad. of Sci., Moscow, USSR). *Acta Astronaut.* (GB), vol.9, no.10, p.609-11 (Oct. 1982). [received: March 1983]

The investigation, by light and electron microscopy, as well as by X-ray methods, of the structure of copper and silver samples obtained by containerless solidification in microgravity conditions has revealed a texture of single-crystal type and a clearly pronounced structure. In copper samples, pores have been found whose occurrence could be due to the formation of shrinkage cavities or to the evolution of gases the starting samples contained. The high purity of the materials, lack of contact with container walls and lack of convection have caused the solidification to occur in the conditions of high supercooling with the formation of few dendrites. (4 refs.)

63278 Observations on the non-planar freezing of aqueous salt solutions. C.Korber, M.W.Scheiwe (Helmholtz-Inst. für Biomedizinische Tech., RWTH Aachen, Aachen, Germany).

J. Cryst. Growth (Netherlands), vol.61, no.2, p.307-16 (March 1983). A light microscope equipped with a special freezing stage and a spectrophotometer was employed to study the non-planar solidification of the binary model system H₂O-NaMnO₄. Instabilities of the initially planar solid-liquid interface were detected visually and could be related to the constitutional supercooling criterion. The redistribution of solute in the interstices between the dendrite arms was measured densitometrically. The concentration profiles scanned along the interdendritic midlines were generally about linear. This result is in agreement with Flemings' dendritic solidification model which assumes local equilibrium according to phase diagram relations in small volume elements. (32 refs.)

63279 On the steady-state continuous casting Stefan problem with non-linear cooling. M.Chipot (Univ. de Nancy, Nancy, France), J.-F.Rodrigues. *Q. Appl. Math.* (USA), vol.40, no.4, p.476-91 (Jan. 1983).

A steady-state one-phase Stefan problem corresponding to the solidification process of an ingot of pure metal by continuous casting with nonlinear lateral cooling is considered via the weak formulation introduced for the dam problem. Two existence results are obtained, for a general nonlinear flux and for a maximal monotone flux. Comparison results and the regularity of the free boundary are discussed. A uniqueness theorem is given for the monotone case. (16 refs.)

63280 Melting of peritectic intermediate phases in Cu-Zn and Cu-Ge systems. E.S.Kucherenko.

Russ. Metall. (GB), vol.40, no.6, p.192-5 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.197-200 (1981).

The melting of the intermediate phases with a wide range of concentrational homogeneity was examined: ϵ -phase in the system Cu-Zn and the ξ -phase in Cu-Ge. Various processes were identified which led to the formation of fusion spots inside the grains as well as to complete melting of the initial solid phase. The mechanism is governed by the initial phase composition of the alloys and the type of phase equilibria in the solid and liquid phases. (3 refs.)

63281 Analysis of the factors determining the yield of a peritectic reaction, important in choice of optimal heat-treatment conditions. I.M.Galushko.

Russ. Metall. (GB), no.6, p.196-200 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.201-5 (1981).

The influence was examined of the external factors (cooling conditions, alloy composition) and internal ones (features of the structure of the equilibrium diagram), separately and combined, on the peritectic reaction which is determined by the formula $\epsilon = 1 - \eta_1/\eta_2$. The value of ϵ depends on the temperature of the peritectic horizontal during solidification of melts of peritectic systems with the criterion of the peritectic reaction $K > 1$. The influence was examined of the form of growth and the structure of the surfaces of the primary and peritectic phase crystals on the mechanism of the peritectic reaction, and a scheme is proposed to illustrate the dependence of ϵ on the form of growth of the grains which participate in the reaction. It is shown, on the example of Cu-Cd and Cu-Sn systems, that an increase in the relative quantity of primary grains in the solidifying melts lowers the yield (efficiency) of the peritectic reaction. (10 refs.)

63282 Turbulent flow in chill block casting. P.G.Zielinski, D.G.Ast (Dept. of Material Sci. & Engng., Cornell Univ., Ithaca, NY, USA).

Ser. Metall. (USA), vol.17, no.3, p.291-4 (March 1983).

Molten Ni₂Si₂B₇ alloy was ribbon cast ejecting from a nozzle onto a rapidly rotating drum. In order to visualize the flow pattern, WC particles were added to the melt. Uniform ribbons were obtained when the melt puddle which forms on top of the moving substrate was stable. Microscopic examination of the frozen-in flow patterns (revealed by the WC particle distribution) showed a set of concentric elliptical lines, elongated in the direction of the flow. The overall appearance was very similar to the formation of turbulent spots in liquids due to boundary layer instability. The edge of the crucible nozzle can be considered as a large localized disturbance producing a turbulent spot. These instabilities in the melt should be taken into account for refined descriptions of heat transfer and solidification during chill block casting of metallic glasses and microcrystalline alloys. (11 refs.)

63283 Ultrafast solidification of ultrathin molten silicon films.

P.H.Bucksbaum, J.Bokor (Bell Telephone Labs., Holmdel, NJ, USA).

Topical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.WA3/1-4

The authors have utilized melting pulses produced by a picosecond injection locked KrF* laser to observe melts with solid-liquid regrowth velocities considerably higher than 20 m/s for the first time. These measurements provide new tests of thermodynamic models of silicon amorphization from an undercooled melt. (6 refs.)

63284 Formation and stability of reverted austenite in low-carbon nickel-molybdenum steels. V.M.Schastlivtsev, I.L.Barmina, I.L.Yakovleva, Yu.L.Legostaev, V.A.Malyshvskii (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.316-22 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr.* (GB) Magnetothermal and electron-microscopic methods were used to study the phase composition in the case of austenitization in the intercritical temperature range and the stability of reverted austenite (i.e. of austenite formed during heating temperatures in the intercritical temperature and retained after cooling to room temperature, which should be distinguished from residual austenite remaining in steel after treatment) in low-carbon nickel-molybdenum steels of electroslag origin. The heat treatment conditions were found for ensuring the maximum amount of the reverted austenite and the highest stability of this austenite. It was found that the amount of the reverted austenite was inversely proportional to the rate of cooling from the intercritical temperature range. (6 refs.) A.T.

63285 Nonequilibrium crystallization and structural transitions during heating of microcircuit leads made of Fe-C and Fe-C-Si alloys. V.F.Bashev (Ukraine & Russia Reunion Tercentenary State Univ., Dnepropetrovsk, Ukraine SSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.331-6 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr.* (GB)

X-ray structure analysis and measurements of the electrical resistivity during continuous heating were used to study the influence of the method of cooling on the tendency of formation of metastable crystalline and amorphous phases in microcircuit leads made of Fe-C and Fe-C-Si alloys. The sequence of appearance of metastable intermediate phases during formation of an equilibrium state was established and the appearance of a new silicon carbide was studied. (8 refs.) A.T.

63286 Order-disorder transition in Fe₃Si alloy during mechanical crushing. E.P.Elsukov, V.A.Barinov, V.R.Galakhov, E.E.Yurchikov, A.E.Ermakov (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.337-40 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr.* (GB)

The methods of Mossbauer spectroscopy, X-ray diffraction, and magnetization measurements were used in a study of mechanical crushing of ordered Fe₃Si, which produced a disordered state of this alloy. The disordering resulted in an increase in the parameters of the b.c.c. lattice and in a reduction in the average magnetic moment per iron atom in the alloy. (11 refs.) A.T.

63287 Investigation of the phase composition, structure, and magnetic properties of alloy Sm₂Co₁₀Fe₃Cu₁₂Zr₁₀. E.I.Teitel', A.G.Popov, V.G.Maikov, L.M.Magat, N.N.Shecheleva, Ya.S.Shur (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.349-57 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr.* (GB)

Electron microscopy was used to study the phase composition and structure of sintered magnets made of Sm₂Co₁₀Fe₃Cu₁₂Zr₁₀ and subjected to homogenization and annealing. Annealing resulted in precipitation of phases of the SmCo₅ type and of hexagonal Sm₂Co₇. Moreover, the phase based on SmCo₁₇ was transformed from the hexagonal to the rhombohedral modification and this was accompanied by the formation of structural domains with the 60° or 180° misorientation (about the [111]_R direction). Possible influence of these structural components on the magnetic properties of the alloy was analysed. (7 refs.) A.T.

63288 Decomposition kinetics for supercooled austenite in steel 15Kh1M1F. A.P.Smirnova, I.I.Mints, M.M.Shtenberg (UralVTI, Chelyabinsk, USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.572-4 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met.* (USSR), vol.24, no.8, p.52-3 (Aug. 1982). [received: March 1983]

A study was made by magnetometric, dilatometric, and metallographic methods of decomposition kinetics for austenite in hot-rolled steel 15Kh1M1F; with uninterrupted cooling for specimens of two melts with carbon contents at the lower and upper limits of the specified composition, and under isothermal conditions for one melt. The austenitization temperature (1050°C) and soaking time (30 min) were selected in accordance with factory procedure for heat treating pipes made of steel 15Kh1M1F. The amount of residual austenite in the steel was determined by an X-ray method. (5 refs.)

63289 Carbon effect on ordering of γ -Ni₃Al in rapidly solidified Ni₂Al-C alloys. K.H.Han, W.K.Choo (Dept. of Materials Sci. & Engng., Korea Advanced Inst. of Sci. & Technol., Seoul, Korea).

Ser. Metall. (USA), vol.17, no.3, p.281-4 (March 1983).

Only the ordered FCC Ni₃Al_x ($x=0-0.34$) single phase was formed in pseudo-binary Ni₂Al-C alloys by RSP. In other words, the maximum solubility of carbon in γ -Ni₃Al was extended to about 7.8 at.%. A strong preferred orientation of RSP samples along the (100) direction normal to the substrate surface was observed, and it became more pronounced with increasing carbon content. By the structure analysis using the integrated intensity ratio I_{200}/I_{100} of the fundamental to superlattice reflections, it was found that the ordering of γ -Ni₃Al can be further induced by carbon atoms probably through the cooperative ordering of substitutional atoms (nickel and aluminum) and carbon atoms to form the L₁2 type Ni₃Al_x perovskite structure. (5 refs.)

63290 Ferrite growth during slow cooling from the intercritical annealing of a dual-phase steel. J.J.Yi, I.S.Kim (Korea Advanced Inst. of Sci. & Technol., Seoul, Korea).

Ser. Metall. (USA), vol.17, no.3, p.299-302 (March 1983).

The microstructural observations of austenite transformation during cooling from the intercritical annealing shows that the 'transformed' ferrite does not grow epitaxially on the 'retained' ferrite, but nucleates on the interior austenite grain boundaries of the austenite pool and grows inside the austenite pool leaving the sandwiched austenite between the 'transformed' and the 'retained' ferrite. The old ferrite-austenite interfaces which formed at the intercritical annealing temperature are much less mobile than those formed on cooling between the 'transformed' ferrite and the untransformed austenite. The isolated retained austenite particles are the remainders of the shrinking sandwiched austenite particles which are aligned between the 'transformed' and the 'retained' ferrite. The strength of the 'transformed' ferrite is always higher than that of the 'retained' ferrite as long as the sandwiched austenite was preserved during cooling. (9 refs.)

- 63291 Influence of alloying and preliminary deformation on phase composition and mechanical properties of Fe-Mn alloys. L.S.Malinov, E.Ya.Kharlanova. *Russ. Metall. (GB)*, no.6, p.140-5 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.141-7 (1981).
- An increase in the manganese content and additional alloying of alloy G20 with copper and aluminium reduces the tendency to martensite formation and strain strengthening. A good combination of the strength and ductility characteristics is achieved with a preliminary hot deformation which ensures a certain intensity of martensite transformation during loading. Preliminary hot deformation and treatment, which includes preliminary cold deformation followed by annealing at 400°C, affect differently the (ν - ϵ) and (γ - α) transformations. (14 refs.)

- 63294 Computer modelling of grain boundary segregation. M.A.V.Chapman, R.G.Faulkner (Univ. of Technol., Loughborough, England). *Acta Metall. (USA)*, vol.31, no.5, p.677-89 (May 1983).
- A computer model has been developed to simulate grain boundary segregation during cooling from high temperatures. During this cooling possibilities exist for the occurrence of both equilibrium and non-equilibrium segregation. The model accounts for these processes simultaneously. The model predictions for boron in steel are compared with previous experimental estimates and with the results from this work of an Auger electron spectroscopy study of grain boundary segregation in a tempered ferritic-martensitic 12% Cr steel. (16 refs.)
- 63295 On the coarsening of γ' in Alloy 800. M.Vittori, G.Guidi (Div. Sci. dei Materiali, ENEA, Roma, Italy). *Acta Metall. (USA)*, vol.31, no.5, p.725-9 (May 1983).
- In a γ' hardened steel the authors have observed that the γ' average radius changes from grain to grain after a long term ageing at the temperature of 600°C. This effect has been explained on the basis of a simple model in which the precipitation of $M_{23}C_6$ Cr rich carbides on the grain boundaries is taken into account. The precipitation of the carbides causes a Cr depletion in the matrix; the amount of Cr depletion results to change from grain to grain since it depends on the single grain linear size. Since the Cr content affects the solubility of the γ' forming elements, a different coarsening rate constant for γ' particles growing in grains of different size is then expected on the basis of the Lifshitz, Sroloviz and Wagner theory of particle coarsening. The experimental investigations have been carried out on samples of four heats of Alloy 800 differing each other by small variations in the Ti and Al contents, and aged at 600°C for times ranging from 10^3 to 10^4 h. Transmission electron microscopy and WDS microprobe analyzer have been used. (19 refs.)

- Contrast and convergent beam diffraction studies of precipitates in quenched, aged platinum containing about 800 atomic ppm carbon have identified a body-centered tetragonal structure with $a=0.39$ nm, $c=0.59$ nm, $c/a=1.5$. An investigation of the microstructure of similarly treated platinum of various purities and of platinum doped with carbon indicates the precipitates to be a metastable carbide of composition at or close to Pt_2C . (12 refs.)

- 63297 A study of precipitation in interstitial alloys. III. Coherent and semicoherent growth mechanisms. U.Dahmen, K.H.Westmacott, M.J.Witcomb (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA). *Acta Metall. (USA)*, vol.31, no.5, p.749-54 (May 1983).
- For pt.III see *ibid.*, vol.31, no.5, p.743 (1983). Frank and Shockley partial dislocations have been generalized using the coherency concept of Olson and Cohen to describe coherent and semi-coherent growth ledges on plate-shaped precipitates. Carbide platelet precipitate growth on {001} planes in platinum was quantified in these terms using displacement fringe and strain contrast analysis of dislocations surrounding the precipitates. The first two stages in the growth sequence proceeded solely by semi-coherent ledges associated with $1/4\{001\}$ (Frank-type) dislocations. These stages thus correspond to the co-precipitation of vacancies and carbon atoms. Coherent ledges were observed only occasionally during the third stage of growth, the ledges being bounded by $1/4\{201\}$ (Shockley-type) dislocations. The uniqueness of this result is interpreted in terms of the low solubility of carbon in platinum which results in similar concentrations of quenched-in vacancies and carbon atoms. (15 refs.)
- 63298 A study of precipitation in interstitial alloys. IV. The precipitation sequence in Pt-C. K.H.Westmacott, M.J.Witcomb, U.Dahmen (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA). *Acta Metall. (USA)*, vol.31, no.5, p.755-62 (May 1983).
- For pt.III see *ibid.*, vol.31, no.5, p.749 (1983). A systematic transmission electron microscopy study of the entire carbide precipitate nucleation and growth process in quenched, aged platinum has been made. Five distinct stages have been identified in the growth sequence, four coincide with changes in the Burgers and displacement vectors and the fifth in the configuration of the precipitates. Diffraction contrast analysis has shown that all the precipitate platelets lie in {001} matrix planes, are vacancy in character and are semi-coherent. Precipitates form initially by co-precipitation of vacancies and carbon atoms and the growth sequence follows a ripening type process. At intermediate aging temperatures voids become the preferred growth sites presumably acting as vacancy sources. Various aspects of the precipitation reaction have been explained from the standpoint of the role of vacancies (V), and the system can be treated either as a Pt-C binary or a Pt-C-V ternary alloy. (16 refs.)
- 63299 Resolution of Cu atoms in a GP[1] zone in Al-Cu by FIM and determination of the GP[1] structure. T.Mori, M.Wada, H.Kita, R.Uemori, S.Horie, A.Sato, O.Nishikawa (Dept. of Materials Sci. & Engng., Tokyo Inst. of Technol., Yokohama, Japan). *Jpn. J. Appl. Phys. Part 2 (Japan)*, vol.22, no.3, p.L203-5 (March 1983).
- By FIM the atomic arrangement of a GP[1] zone in an aged Al-Cu alloy is resolved into isolated spots on the {024} planes. These resolved spots are identified as the images produced by individual Cu atoms of the GP[1] zone protruding on the {024} surfaces. By observing the position and shape formed by the spots corresponding to the Cu atoms during the successive field evaporation, it is concluded that a GP[1] zone consists of a single layer of Cu atoms on the {002} planes.
- 63300 Crystallographic aspects of precipitation of supersaturated aluminium-base solid solutions. T.V.Shegegoleva (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.2, p.273-96 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
- A review is given of the papers reporting studies of the mechanisms of ageing of aluminium alloys. It is confirmed that the ageing mechanism is determined by the methods of modification of a 'perfect' crystal structure of the matrix into the lattices of stable precipitation phases. Metastable phases with crystal lattices, which can be defect-free or containing defects, are formed at intermediate stages. It is shown that the formation of the h.c.p. and b.c.c. lattices from the f.c.c. structure involves a premartensitic state with an incomplete hear. A new explanation is provided of the phenomenon of recovery and of the influence of double heat treatment on the structure of alloys containing metastable phases with defect lattices. (128 refs.) - 63301 The effect of the nitrogen potential on the coarsening kinetics of VN precipitates. O.E.Atasoy (Metall. Engng. Dept., Middle East Tech. Univ., Ankara, Turkey). *Metall. Trans. A (USA)*, vol.14A, no.3, p.379-84 (March 1983).
- An Fe-1.06 pct V alloy was used to study the kinetics of coarsening of VN precipitates. Nitriding was carried out at 600°C in purified NH_3 gas. Nitrided specimens were then annealed at 820°C in furnace atmospheres of different NH_3/H_2 ratios. The transmission electron microscopy technique was used to measure the precipitate sizes. The data on the precipitate sizes indicate that the coarsening of the plate shaped VN precipitates seems to be diffusion controlled. The precipitate coarsening rate appears to be lowered by the increase in NH_3 content in the furnace atmosphere. The particle size distributions were found to be broader than the predictions of the LSW theory. (19 refs.)

81.40 TREATMENT OF MATERIALS AND ITS EFFECTS ON MICROSTRUCTURES AND PROPERTIES

63302 The evolution of the structure of a two-dimensional soap froth [theory of grain growth]. D.Weaire, J.P.Kermode (Dept. of Phys., Univ. of Coll., Dublin, Ireland). *Philos. Mag. B (GB)*, vol.47, no.3, p.L29-31 (March 1983). Soap froths are of interest because they are considered to evolve by a similar mechanism to that which governs grain growth in metals and sintered materials. The authors draw attention to the fact that the conclusions of Smith and others concerning the evolution of two-dimensional (2-D) soap froths, which are based on early experimental data, do not appear consistent with later data analysed by the Aboav (1980). This shows no stable limiting distribution of cell shapes within the range of the experimental samples. If this is accepted, the asymptotic evolution of the 2-D soap froth system (and any other physical system governed by analogous principles) must be radically different from what it is generally assumed to be. (6 refs.)

63303 Determination of the optimum grain size in KhN67MVTYa alloy taking account of the basic operational parameters. I.V.Doronin. *Russ. Metall. (GB)*, no.6, p.101-4 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.103-6 (1981).

An attempt is made to establish the dependence of the optimal grain size which ensures maximum high-temperature strength, on the require operating time and service life in the temperature range 600-900°C and failure times form 0.1 to 1000 hr. A similar relationship was obtained for the alloy KhN78T but for a narrower range of temperatures and times to failure. The applicability of the obtained formula is limited because it does not take into account the state of the grain boundaries, the distribution and degree of dispersion of the strengthening phase. 63304 Use of the 'Tosol-K' quenching fluid for the bulk quenching of steels. V.I.Astashchenko, N.P.Ionkina, G.I.Yantsen, I.E.Sorokin, M.G.Gedberg.

Met. Sci. & Heat Treat. (USA), vol.24, no.5-6, p.377-80 (June 1982). Translation of: *Metallized. & Term. Obrab. Met. (USSR)*, vol.24, no.6, p.5-8 (June 1982). [received: Feb. 1983]

Investigates the possibility of using the 'Tosol-K' fluid for bulk quenching of steels. The 'Tosol-K' fluid (TU 6-02-3-144-78) is a 50% aqueous solution of oxyethylized alkylphenol containing antifoam and anticorrosion additives. It was concluded that 'Tosol-K' fluid is recommended for the bulk quenching of steel 45, 40Kh, 40KhN2MA, and 42KhMFA components. The high hardenability of the components in the absence of quenching cracks is ensured by selection of the concentration and temperature of the aqueous 'Tosol-K' solutions: a solution concentration of 0-30% for components of carbon steels, and 30-65% for components of the alloy steels. The temperature of a solution of any concentration should not exceed 40°C. Production testing of a 65% 'Tosol-K' solution for the quenching of steel 42 KhMFA crankshafts and a 50% solution for the quenching of steel 40Kh components indicated the high technological characteristics and effectiveness of the use of this polymer quenching medium. (4 refs.)

63305 Physicochemical fundamentals of the development of heat-resistant niobium alloys. V.G.Grogorovich, E.N.Sheftel.

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.472-8 (July-Aug. 1982). Translation of: *Metallized. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.23-9 (July 1982). [received: March 1983]

The principal methods of improving the heat resistance of niobium alloys are solid solution alloying and strengthening with dispersed particles of refractory phase. These methods are discussed with reference to equilibrium diagrams. (15 refs.)

63306 Examination of applied stress and prestrain effects on recovery of work hardened Cu-SiO₂. N.Shigenaka, M.Okabe, T.Mori (Dept. of Materials Sci. & Engng., Tokyo Inst. of Technol., Yokohama, Japan). *Acta Metall. (USA)*, vol.31, no.5, p.801-4 (May 1983).

Effects on external stress and prestrain on recovery of work hardening have been studied in Cu-SiO₂ crystals. When the external stress is below a critical value, approximately equal to the yield stress, the softening on annealing is independent of the external stress. The softening decreases when the external stress exceeds the critical value. The temperature dependence of the softening rate is insensitive to the amount of the prestrain which has caused work hardening. It is concluded that the interaction between Orowan loops surrounding a SiO₂ particle is not so strong as to affect the climb rate of individual Orowan loops considerably. (12 refs.)

63307 The structural state and its association with low temperature work hardening of structural titanium alloys. B.I.Verkin, F.F.Lavrentev, Yu.A.Pokhil, P.P.Dudko (Phys.-Tech. Inst. of Low Temperatures, Acad. of Sci., Kharkov, Ukrainian SSR). *Cryogenics (GB)*, vol.23, no.4, p.203-6 (April 1983).

On the basis of transmission electron microscope investigations on the structural state of some structural titanium alloys strained at 4.2K, the nature of low temperature ductility work hardening and jumplike character of the stress-strain curve is analysed. (11 refs.)

63308 Effects of mechanical drawing treatment on the characteristics of internal friction and thermally stimulated current on low density polyethylene. Bong-Heup Kim, Do-Yul Kang, Jae-Hwan Kim (Korean Inst. Electrical Engrs., Seoul, Korea). *Trans. Korean Inst. Electr. Eng.*, vol.31, no.10, p.116-23 (1982). In Korean.

Investigates the relaxation of molecular chain segments on a low density polyethylene above room temperature. A peak observed about 40°C in internal friction and the main peak observed above 60°C in thermally stimulated current are related to the molecular chain relaxation process in the crystalline phase. Melt-recrystallisation occurs in the course of mechanical drawing to more than double length even at room temperature. For the origin of the trap of injected electrons in bulk, it is plausible to assume the distorted potential around the molecular chain due to micro-physical deformities existing already as incompleteness in the crystal as well as the interface between crystalline and amorphous regions of the real specimen. It is estimated that the activation energies of traps in the crystal phase and interface are 0.9 eV and 1.1 eV respectively; the height of potential barrier existing in the interface is about 0.3 eV. (14 refs.)

63309 Influence of sulfur and nitrogen on the characteristics of texture formation as a result of deformation and annealing of Fe+3% Si single crystals. R.L.Gershman, V.Ya.Goldshstein (Sci.-Res. Inst. of Metall., Chelyabinsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.2, p.396-400 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

A study was made of the influence of second-phase particles precipitated during various stages of the process of deformation and annealing, on the formation of a texture during annealing of silicon iron single crystals. The deformation by 70% involved cold rolling and various annealing treatments were applied. Precipitation of nitride and sulfide particles before cold rolling resulted in a scatter of the strain texture parameters. Precipitation of disperse phases during stages preceding recrystallization tended to improve the primary recrystallization texture and facilitated a second recrystallization during high-temperature annealing. (2 refs.) A.T.

63310 Effect of extinction of the texture coefficients of uranium. C.N.Rao, R.Krishnan (Metall. Div., Bhabha Atomic Res. Centre, Bombay, India). *J. Nucl. Mater. (Netherlands)*, vol.114, no.2-3, p.347-8 (Feb. 1983).

In calculating the texture parameters from measured X-ray intensities, extinction effects are generally neglected. However, this can lead to considerable uncertainty in representing the degree of texture. The influence of extinction on the intensities of Bragg reflections of uranium have therefore been discussed. (8 refs.)

63311 Effect of structure, substructure, and crystallographic texture on the mechanical properties of titanium alloys. A.I.Khorev, A.A.Babareko, A.I.Krasnozhan, S.Ya.Betsofen (All-Union Sci.-Res. Inst. of Aviation Materials, USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.7-8, p.463-7 (July-Aug. 1982).

Translation of: *Metallized. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.16-19 (July 1982). [received: March 1983]

The effectiveness of textural hardening under biaxial symmetric tension increased with increasing intensity of the (0001) base texture of the α -phase and decreased with increasing amount of β -phase in the alloys (from VT5-1 to VT14 and VT15). Experimental data agreed well with computed values. Use of specially controlled strain, heat-treatment, and thermomechanical-treatment conditions made it possible to vary directly the microstructure, substructure, and crystallographic texture of various classes of titanium alloys and to achieve a high level of strength in the plane and complex stressed states. (3 refs.)

63312 Recrystallisation of austenite in low-alloy steels (0.7% V, 0.04% Nb) with carbo-nitride hardening. Yu.I.Matrosov, V.N.Filimonov, M.L.Bernshteyn. *Russ. Metall. (GB)*, no.6, p.93-100 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.96-102 (1981).

Examination of the effect of the austenisation temperature has shown that for steel 09G2 (1.6% Mn, without V and Nb) an increase in the initial heating temperature from 950 to 1150°C slows down the softening during post-deformation holding; this is attributed to the decrease in the number of spots with germination of recrystallisation volumes, associated with the growth of the austenite grain and its increased homogeneity. In steel 09G2FB (1.55% Mn, 0.07% V, 0.04% Nb) an increase in the austenisation temperature above 1050°C slows down sharply static recrystallisation, and this is attributed to intensive dissolution of niobium carbonitride at this temperature and alloying of the austenite with the niobium. Provided that the micro-additions of niobium are first dissolved in the austenite, static recrystallisation after hot-deformation at 1100-1050°C is retarded; below 925°C the recovery and recrystallisation in niobium steel are virtually suppressed, mainly due to the separation of disperse Nb(C,N) particles on the substructure. Post-deformation holding at 750°C causes considerable softening for both the above steels, which is due to the deformation-initiated evolution of ferrite. (7 refs.)

63313 Preferred orientation in extruded aluminum alloy rod. D.N.Lee (Dept. of Metall. Engng., Seoul Nat. Univ., Seoul, Korea), Y.H.Chung, M.C.Shin.

Scr. Metall. (USA), vol.17, no.3, p.339-42 (March 1983).

Preferred orientation in extruded rod is better described by the axial and radial orientations except in the center fiber. The texture of the center is of the fiber type and can be described adequately by the axial orientation of strong {111} and weak {100}. The texture of the outer layer may be described by {110}(335) where {110} corresponds to the plane normal to the radial direction and {335} to the axial direction of the rod. This texture is comparable with the rolling texture of aluminum or its alloys, where the axial and radial directions correspond to the rolling direction and the direction normal to rolling plane, respectively. (10 refs.)

63314 Repeated mechanical strengthening as a method of increasing the endurance of constructional steels. A.V.Dobrik, V.F.Kucherenko, V.P.Latysh (M.I. Arsinichev Dneprodzerzhinsk Industrial Inst., USSR).

Sov. Mater. Sci. (USA), vol.18, no.3, p.283-5 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.105-7 (May-June 1982). [received: Feb. 1983]

It is concluded that surface mechanical strengthening may be successfully used for increasing the life of parts formerly in service, including those with cracks. Cracks in the form of a network of thermal erosion appear particularly in hot-rolling rolls. Repeated surface plastic deformation may be an effective operation for restoring their life. A determination was made of the effectiveness of repeated surface work hardening to increase the life of certain constructional steels. The materials of the investigation were the widely used roll steels 45, 50KhN, and 60Kh2M in the normalized condition. The fatigue tests were made with circular bending on unnotched cylindrical samples after grinding (class seven surface finish). The cold work hardening was done by burnishing on a three-roller attachment with a clamping load of $P=1600$ N. (6 refs.)

63315 Free-cutting stainless steel wire with high-strength. H.Ogita (Res. & Dev. Group, Sumitomo Electric Industries Ltd., Osaka, Japan), S.Yamamoto, K.Sato.

Sumitomo Electr. Tech. Rev. (Japan), no.22, p.189-94 (Jan. 1983).

Cold-drawn and work-hardened SUS 304 stainless steel wire is often used as high strength stainless steel wires. While SUS 304 stainless steel is excellent in strength, ductility, corrosion resistance, high-temperature stability and other properties, as well as having a relatively low production cost, this material has certain limitations. Typically, when it is used for compression-coiled springs, antennas or shafts, it offers inferior grindability at the end surfaces or sides, and limited suitability for machining with cutting tools. Sulphur added SUS 303 stainless steel, which is frequently used as free-cutting stainless steel, has lower strengths and is also not suited for use in springs or antennas. In order to improve the machinability and grindability of SUS 304 stainless steel without reducing the strength, ductility or corrosion resistance additions of small amounts of sulphur, molybdenum and lead were made. The anticipated result was obtained, and a detailed description of the successful experiments is given. (no refs.)

63316 Recovery of properties and nature of ordering of steels during tempering under load. V.V.Zabil'skii, V.I.Sarrak (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.55, no.2, p.368-73 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallog. (GB)*

An investigation was made of the influence of second heating of steels after tempering under load on the stability of the residual strain and on the improvement in the strength characteristics. It was found that second heating resulted in a partial reduction (recovery) of the residual strain, which was influenced by the processes occurring during tempering, such as precipitation of a solid solution of carbon in martensite and relaxation of the residual microstresses. Recovery of the residual strain was accompanied by softening. It was concluded that relaxation of the peak stresses was not the only reason for the increase of the strength as a result of tempering under load. This increase in the strength was largely due to the formation (as a result of tempering under load) of stresses with the opposite sign, which disappeared during second tempering. (4 refs.) A.7.

63317 Heat treatment of molybdenum, tungsten and their alloys up to 2100°C. R.Eck (Metallwerk Plansee GmbH, Reutte, Austria).

High Temp.-High Pressures (GB), vol.14, no.3, p.327-33 (1982). (10th Plansee Seminar on 'Trends in Refractory Metals, Hardmetals, and Special Materials, and their Technology', Reutte, Austria, 1-5 June 1981).

The heat treatment of powder metallurgical products of pure or alloyed molybdenum and tungsten has a determining influence on the properties of semifinished and final products. For metals that crystallize in a cubic body-centred lattice without a crystallographic transformation, the development of a controlled grain structure is essential. Problems of annealing in connection with recovery, recrystallization, and grain-growth, phenomena are discussed for selected examples which had been subjected to different degrees of deformation. The effects of heat treatment of molybdenum and TZM in hydrogen and vacuum at temperatures up to 2100°C on tensile properties of these materials are discussed. W5Re develops ductility maxima dependent on degree of deformation and annealing temperature. Problems of stress-relieving anneals are discussed with tungsten sheet used as an example. (7 refs.)

63318 Thermomechanical treatments of a 1050 pearlite steel. L.J.Chen, T.W.Wu, H.C.Cheng (Dept. of Materials Sci. & Engng., National Tsing Hua Univ., Hsinchu, Taiwan).

Metall. Trans. A (USA), vol.14A, no.3, p.365-78 (March 1983).

A study of the microstructures and mechanical properties of thermomechanically treated 1050 steel has been carried out. The materials were first transformed to fine and coarse lamellar pearlite structures. These samples were reduced 75 pct in thickness by cold rolling, then heat treated at 780°C (up-quenching) or 650°C (annealing) for different periods of time, followed by air-cooling. The mechanical properties were found to be vastly improved by suitable thermomechanical treatments. A significant improvement in yield strength was accompanied by moderate increase in ultimate tensile strength, and the elongations were maintained above 15 pct in 3 cm gage length. The optimal mechanical properties were developed between 30 and 120 seconds during 780°C up-quenching for coarse pearlite samples and 100 to 400 seconds for both annealed coarse and fine pearlite specimens. The improvement in mechanical properties was correlated with distinct microstructures in pearlite regions, which were fine subgrains (or grains) less than 1 μ m in size and dispersed globular carbide particles along the subgrain (or grain) boundaries. (13 refs.)

63319 The effect of ITMT's and P/M processing on the microstructure and mechanical properties of the X7091 alloy. V.W.C.Kuo, E.A.Starke, Jr. (Fracture & Fatigue Res. Lab., Georgia Inst. of Technol., Atlanta, GA, USA).

Metall. Trans. A (USA), vol.14A, no.3, p.435-47 (March 1983).

The influence of microstructure and texture on the monotonic and cyclic properties of X7091-T651 was investigated. The various structures were developed from conventional ingot metallurgy (I/M), powder metallurgy (P/M) and intermediate thermal mechanical treatments (ITMT). Powder metallurgy produced a finer grain structure and particle distribution than I/M. Intermediate thermomechanical treatment produced a recrystallized, coarse grain structure with a weak texture, compared to the unrecrystallized grain structure and sharp texture obtained with conventional processing (CP). All materials had comparable monotonic properties. The resistance to fatigue crack initiation (FCI) increased with both a reduction in grain size and a finer particle distribution. It appears that large grains allow more reversible slip and reduce the amount of accumulated plastic strain within the reverse plastic zone. It is also believed that a greater degree of fatigue crack closure, which may be associated with large grains and a rough FCP surface, results in a lower FCGR in the low ΔK region. The intermediate thermomechanical treatment of P/M X7091 produced the optimum microstructure giving the best combination of mechanical properties. (48 refs.)

63320 Influence of surface condition on the magnetic properties of Fe-3% Si alloy. R.B.Puzhevich, V.G.Borisenko, L.A.Shyartsman, V.I.Chistyakov, Z.P.Ventskovich (Ural Sci.-Res. Inst. for Ferrous Metals, USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.5-6, p.422-5 (June 1982). Translation of: *Metall. & Term. Obrab. Met. (USSR)*, vol.24, no.6, p.39-41 (June 1982). [received: Feb. 1983]

An investigation was made of the influence of the primer coat on the magnetic properties of Fe-Si alloy after high temperature annealing. With the use of hydrated magnesium oxide to obtain the magnesium coating on Fe-3% Si alloy the negative influence of the coating on the magnetic properties of this alloy related to the introduction of oxides into the surface of the metal exceeds the positive influence caused by the occurrence of tensile stresses. The magnetic properties of Fe-3% Si alloy given a high temperature anneal without coating are higher than of the alloy annealed with a coating formed from hydrated magnesium oxide. A decrease in the negative influence of the primer coat may be obtained by selection of an original material for the coating which provides preferential formation of primer coats at temperatures exceeding the temperature of secondary recrystallization of the metal. A decrease in the moisture content of the original material, magnesium oxide, causes an increase in the temperature of formation of the primer coat of magnesium silicate coatings. (9 refs.)

63321 Effect of chromium and aluminum on the physical and mechanical properties of precipitation-hardening Fe-Mn Elinvar. O.A.Khomenko, I.F.Khil'kevich (Ural Sci.-Res. Inst. of Ferrous Metall., USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.5-6, p.425-8 (June 1982). Translation of: *Metall. & Term. Obrab. Met. (USSR)*, vol.24, no.6, p.42-4 (June 1982). [received: Feb. 1983]

Concerns the physical and mechanical properties of precipitation-hardening Fe-Mn Elinvars additionally alloyed with aluminum and chromium to improve the corrosion resistance. The combination of physical and mechanical properties and corrosion resistance is optimal for precipitation-hardening Fe-Mn

Elinvar with 5-6% Cr. This alloy can be recommended for elastic elements operating under various conditions. To obtain high strength and elasticity in combination with satisfactory ductility, the authors recommend that Elinvars be strengthened by mechanothermal treatment: water quenching from 1150-1200°, cold deformation with $\epsilon=25\%$, aging at 500° for 6 h. (2 refs.)

63322 Austenite grain refining with rapid heating of steel 40 Kh. K.Z. Shepelevskii, L.A. Lisitskaya (Moscow Evening Metall. Inst., Moscow, USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.443-5 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.2-3 (July 1982). [received: March 1983]

In the process of rapid heating ($v_h=14$ deg/sec) of annealed steel 40 Kh the original austenite grains (grade 9) are refined twice—at the end of the $\alpha\rightarrow\gamma$ transformation at 860° (to grade 10) and at 950° (to grade 13). On the basis of the data obtained, it is proposed that nucleation and growth of austenite grains may occur by means of the $\alpha\rightarrow\gamma$ transformation with formation of finer austenite grains than the original grains and additional refining at a higher temperature, evidently due to recrystallization. It is recommended that the data obtained on austenite grain refining as the result of accelerated heating be used in selecting induction hardening conditions for steel in the high-strength condition. (6 refs.)

63323 Effect of HTTT on the properties of alloy steel castings. M.Kh. Sharifov, R.I. Shukuyrov (Baku Polytech. Inst., Azerbaidzhan SSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.451-4 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.8-10 (July 1982). [received: March 1983]

HTTT (as compared with quenching and high-temperature tempering) was found to improve the strength, ductile characteristics, and fracture toughness of castings of steels 20KhGSL, 30KhNML, and 40KhL. Tests of oil field equipment after HTTT indicated that the combination of mechanical properties is 30-50% better and the wear resistance 20% better. The significant characteristic of strengthening in steels 20KhGSL, 30KhNML, and 40KhL by HTTT was the substantial improvement in the mechanical properties after small deformations. (3 refs.)

63324 Effect of rate of heating for hardening on the structure of alloys VT23 and VT6. O.M. Ivasishin, S.P. Oshkaderov (Inst. of Metal Phys., Ukrainian SSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.459-62 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.14-16 (July 1982). [received: March 1983]

The mechanical properties of titanium alloys of a heterophase ($\alpha+\beta$) structure are determined not only the size of the grain, but also by the intragrain structure. In this connection, the authors analyzed the effect of rapid heating on the formation of the grain and intragrain structure in titanium alloys with an initial fine-grain structure formed during pressure treatment in the ($\alpha+\beta$)-region. (2 refs.)

63325 Recrystallization of deformed austenite in high-speed steel R6M5. Yu.P. Egorov, I.O. Khazanov (Tomsk Polytech. Inst., Tomsk, USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.509-14 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.2-6 (Aug. 1982). [received: March 1983]

The main processes determining the formation of the austenitic structure in deformed steel R6M5 during heating to quenching temperature and in the process of holding at this temperature are found to be polygonization and recrystallization. With deformation near the critical the recrystallization process proceeds by recrystallization in place, which leads to sudden austenite grain growth. The proposed recrystallization mechanism with near-critical deformation is based on the possibility of a section of high-angle boundary transforming to a section with a low-angle misorientation in the process of recrystallization in place and later avalanche-like combination of original austenite grains. (10 refs.)

63326 Austenite grains in tungsten-molybdenum high-speed steels after repeated quenching. A.N. Popandopulo, S.D. Popova, E.F. Sil'nikova (Leningrad Polytech. Inst., Leningrad, USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.515-18 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.6-8 (Aug. 1982). [received: March 1983]

Tungsten-molybdenum high-speed steels are found to be susceptible to intercrystalline fracture. Spontaneous recrystallization of austenite and solution of carbides preceded sudden grain growth. The sudden grain growth occurred by the fusion mechanism. The fusion and growth of silky grains occurred within the limits of the original grains. (8 refs.)

63327 Influence of cyclic annealing on the hardness and structure of high-speed steels. E.A. Smol'nikov, L.M. Orestova (All-Union Sci.-Res. Tool Inst., USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.519-25 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.9-14 (Aug. 1982). [received: March 1983]

In individual cases with the necessity of rapid annealing of high-speed steel together with stepless annealing at 885-675°C, which is done in a single salt bath, cyclic stepped annealing in two salt baths with temperatures of 850 and 700°C and holds in each of them at from 10 to 30 min may be used. It is more rational to use stepless cyclic annealing for small diam. (≤ 30 mm) solid and welded pieces while stepped cyclic annealing may be used for larger pieces. In comparison with isothermal annealing, cyclic annealing using the recommended cycles provides a decrease in the width of the ferrite zone of welded parts in the area of the joint. The structure, distribution, and chemical composition of the carbide phase after cyclic and after isothermal annealing differ very little, which is indicated by the results of hardness measurement. (4 refs.)

63328 Heat resistance of the substructure of hot worked austenite. M.L. Bernshtein, L.M. Kaputkina, N.A. Nikishov (Moscow Inst. of Steel & Alloys, Moscow, USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.537-42 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.24-8 (Aug. 1982). [received: March 1983]

Varying the hot deformation conditions made it possible to obtain a broad variety of structural and substructural conditions of austenite. Reducing the rate and raising the temperature made it possible to obtain a polygonized substructure after hot deformation and retain it after cooling. A homogeneous polygonized isotropic substructure with a fairly low density of dislocations within subgrains slowed down the initial stages in the development of recrystallization under conditions of hot deformation and controlled postdeformation holding. This substructure can be obtained in the steady stage of hot deformation and also by the development of static polygonization processes during brief postdeformation holding. (6 refs.)

63329 Recrystallization of nickel alloy KhN62BMKTYu during hot deformation and quenching. N.N. Korneeva, A.B. Notkin, A.S. Kleshech (All-Union Inst. of Light Alloys, USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.578-80 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.55-7 (Aug. 1982). [received: March 1983]

Structural diagrams of recrystallization plotted in coordinates of temperature and deformation indicate regions of unrecrystallized, mixed, and completely recrystallized structure after deformation and quenching of alloy KhN62BMKTYu. The structure is polygonal in unrecrystallized sections after quenching from 1050-1080°C. (4 refs.)

63330 Structure and properties of low-pearlite steel with different titanium concentrations. A.G. Nasibov, G.A. Sveshnikov, G.G. Gulei, R.K. Guseinov, V.G. Lamintsev (I.P. Bardin Central Sci.-Res. Inst. of Ferrous Metall., USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.581-2 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.58-9 (Aug. 1982). [received: March 1983]

The authors investigated the effect of Ti content on the structure, fracture toughness and susceptibility to brittle fracture of commercial low-pearlite steel 10G27. Changing the Ti content from 0.015 to 0.045% was found to have practically no effect on the mechanical properties; the main difference is the tendency to austenite grain growth. (1 ref.)

63331 Effect of technological inheritance on the hardness of malleable iron after heat treatment. S.N. Biler-Sirotkina (V.Ya. Chubar' Zaporozh'e Machine Construction Inst., USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.583 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.59-60 (Aug. 1982). [received: March 1983]

Ten serially-produced castings of rear brake drums made of pearlitic malleable iron KCh 50-5 (GOST 1215-79) were normalized at 860°C (2 h) in order to determine the effect of inheritance on the hardness of the castings after heat treatment. It is found that the hardness curve after normalization is similar to the original hardness curve except that the values are consistently higher. Thus, from the original hardness it is possible to predict the hardness of the casting after heat treatment. (no refs.)

63332 Structure and properties of a maraging steel after thermomechanical and repeated heat treatment. M.L. Bernshteyn, L.M. Kaputkina, V.G. Prokoshkina, V.A. Varganov, G.S. Krivonogov, A.S. Klyuch.

Russ. Metall. (GB), no.6, p.105-12 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.107-14 (1981).

To model the structure of austenite hot-deformed during high-temperature thermomechanical treatment, a steel was chosen with a composition close to that of the commercial steel 08Kh15N5D2T, the only difference being that it also had an austenitic structure at room temperature which was achieved by increasing the nickel content by an additional 8%. An optimal combination of the mechanical properties after quenching and ageing for maximum hardness was achieved by using high degrees of deformation during the thermomechanical treatment. After optimal high-temperature thermomechanical treatment in the aged state, some increase in strength was achieved with a considerable increase in the impact strength and this applies in particular in the presence of stress concentrators. The improved properties are due to the favourable combination of direct inheritance of the polygonized austenite structure in the martensite grains, with refining of the austenite grain by partial recrystallization, as well as a more uniform and disperse evolution of copper during ageing. (7 refs.)

63333 Influence of residual gas pressure in annealing on the properties of niobium and its alloys. G.G. Maksimovich, E.M. Lyutiy, M.I. Ignatov (G.V. Karpenko Physicochem. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.3, p.257-61 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.78-84 (May-June 1982). [received: Feb. 1983]

The authors investigated the influence of impregnation with interstitial impurities in annealing in 0.1 and 10 mPa vacuums on the properties of niobium and its alloys. The tests were made on microsamples with a gauge length cross section of 1×3 mm. According to the data of an analysis of the oxygen and nitrogen content in the investigated materials after annealing, the quantity of interstitial impurities in the samples increases somewhat, although it does not exceed measuring error (0.005 wt.%). It is concluded that in impregnation of samples by interstitials under the given conditions the distribution of oxygen is uniform. The quantity of nitrogen decreases from the surface into the body of the material, which leads to a change in mechanical properties across the cross section. (22 refs.)

63334 Recrystallization processes in amorphous and polycrystalline silicon. G. Ottaviani.

Report EUR 8141 EN, Comm. European Communities, Luxembourg (1982), 11 pp. Contract 445-78-7 ESI.

Investigates the recrystallization process using nonconventional heating techniques obtained by shining the sample with high power laser or electron pulses. The interaction between an amorphous silicon film and a metal layer when the whole structure is submitted to heat treatment either at low temperature using a conventional furnace or with a pulsed energy source is also studied.

81.40J Elasticity and anelasticity

(see also 62.20D Elastic constants, 62.40 Anelasticity, internal friction, and mechanical resonances)

- 63335 The role of elastic interaction stresses on the onset of slip in polycrystalline alpha brass. II. Rationalization of slip behavior. K.Hashimoto, H.Margolin (Dept. of Phys. & Engng. Metall., Polytech. Inst. of New York, New York, NY, USA). *Acta Metall. (USA)*, vol.31, no.5, p.787-800 (May 1983). For pt.1, see ibid., vol.31, no.5, p.773 (1983). A finite element method analysis, extended to three dimensions, was used to calculate the stresses in 11 grains of an as-cast, 2.4 mm grain size α -brass specimen strained to the proportional limit. Resolved shear stresses (RSS) were not uniformly distributed. However, the predicted slip system based on highest total RSS was found to operate in 9 of the 11 grains. In the other two cases it was not possible to predict which of the two highest RSS slip systems would operate because the RSS were too close. RSS at which slip occurred were compatible with those found by other investigators and measured slip offsets were generally higher where the calculated stresses were higher. Second highest or lower RSS slip systems, which did not form strong obstacles with the primary slip systems, were found to operate. The range of stresses in a given grain, over which slip occurred increased with grain size. On the basis of available evidence, it must be considered that elastic interaction stresses play an important role in the yield process and may exercise influence for strains of at least several percent. (12 refs.)
- 63336 The rheology of thin polystyrene films. B.J.Briscoe, A.C.Smith (Dept. of Chem. Engng. & Chem. Technol., Imperial Coll., London, England). *J. Macromol. Sci. - Phys. (USA)*, vol.B22, no.1, p.53-68 (1983). The interfacial shear strength of a polymer may conveniently be measured by confining a thin film in a sliding elastically deforming contact. The shear strength, defined as the frictional force per unit sheared area, is a measure of the energy dissipation in the film although it implies no particular mechanism. In this paper the shear strength is investigated as a function of both contact pressure and temperature for atactic and isotactic polystyrenes. The thin films have been cast from various solvents accompanied by a range of heat treatments. The data indicate that the casting solvent and the thermal history have a greater influence on the interfacial shear strength than the molecular architecture. The use of friction measurements to probe polymer-solvent interactions is discussed. (31 refs.)
- 63337 The influence of fillers of different activity on the relaxation behaviour of elastomers. G.M.Bartenew, I.L.Gorolova. *Plaste & Kautsch. (Germany)*, vol.30, no.1, p.13-18 (Jan. 1983). In German. Elastomers are complex colloidal systems in which various relaxation phenomena take place. The relaxation of filled elastomers can be caused by heating and one such characteristic relaxation spectrum at 20°C is illustrated, but it can also be effected by mechanical, electrical and magnetic stimulation.

Relaxation changes caused by fillers of different activities of polyisoprene SKI-3 were observed in a series of tests and results are reported. The relaxation time depends on temperature and a formula for its calculation is given. In order to explain the mechanism of relaxation, knowledge of the kinetics of molecular movement is essential and an attempt to tackle this problem is described. Tests using fillers such as soot, graphite, chalk on the SKI-3 polymer are described and relaxation time spectra resulting from these tests are shown. Experimental results agreed reasonably well with theoretical calculations. (11 refs.) G.R.S.

63338 Internal friction study of AISI 410 stainless steel. A.Wolfenden (Dept. of Mech. Engng., Texas A&M Univ., College Station, TX, USA). *Scr. Metall. (USA)*, vol.17, no.3, p.321-5 (March 1983). The results of an internal friction study done at low stress (<37 MPa) on AISI 410 stainless steel in four different conditions of heat treatment are reported. Young's modulus values are given and the strain amplitude dependence of Q^{-1} is analyzed in terms of the Granato-Lücke theory of dislocation damping (1956) to provide an interpretation of the internal friction in terms of microstructural features. Finally, a comparison of the results of this interpretation with metallographic observations on similar turbine blade alloys is made. (12 refs.)

63339 Hydrogen-related internal friction peak in the A15 compound Nb_3Sn . B.S.Berry, W.C.Pritchett (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA), J.F.Bussiere. *Scr. Metall. (USA)*, vol.17, no.3, p.327-32 (March 1983). Some aspects of the hydrogen peak in polycrystalline Nb_3Sn are similar to the hydrogen peak in amorphous Nb_3Ge , which is believed to be of the Snoek type. The two peaks are found at similar temperatures, and are of a comparable magnitude. For both materials, the peaks can only be of a Snoek type if hydrogen atoms act as much stronger elastic dipoles than appears to be the case for BCC Nb. There are, however, important characteristics of the peak in Nb_3Sn that are hard to reconcile with a Snoek-type mechanism. The most troublesome of these are (a) the behavior of the modulus, and (b) the large dispersion associated with the peak, which is even greater than that for the hydrogen peak in glassy Nb_3Ge . From the presently available evidence, therefore, the authors conclude that the 260K peak in Nb_3Sn is probably not a hydrogen Snoek peak. (20 refs.)

63340 Interrelationship of Poisson's ratio with other characteristics of pure metals. S.I.Mikitishin (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR). *Sov. Mater. Sci. (USA)*, vol.18, no.3, p.262-5 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.84-8 (May-June 1982). [received: Feb. 1983] Investigates the physical nature of Poisson's ratio and the interrelationship of it with other characteristics of metals, including the melting point, hardness of the metal, and the elastic constants and also of its relationship to the temperature, amount of deformation, and structural condition of the material. 81.40L Deformation, plasticity and creep

(see also 62.20F Deformation and plasticity, 62.20H Creep)

63341 Influence of texture on dislocation creep and grain boundary sliding in fine-grained cadmium. Shu-En Hsu (Nat. Taiwan Univ., Taipei, Taiwan), G.R.Edwards, O.D.Sherby. *Acta Metall. (USA)*, vol.31, no.5, p.763-72 (May 1983).

The creep behavior of cadmium was studied over the temperature range 0°-260°C (0.46-0.9 T_m) and was found to depend on grain size and texture. Whereas the creep behavior of cast cadmium of moderate grain size (150 μm) is comparable to the creep of most pure polycrystalline metals, unusual creep behavior was observed for a fine-grained (9 μm), textured, powder metallurgy cadmium. The following characteristics were noted for the fine grained textured material. At high stresses and low temperatures, marked change of texture with creep deformation are observed, and the stress exponents and activation energies obtained are consistent with control of deformation by a short circuit diffusion dislocation mechanism. At low stresses and high temperatures, all observations imply that deformation occurred by grain boundary sliding accommodated by slip in the vicinity of the grain boundary. A stress exponent of two, an activation energy equal to that for grain boundary diffusion and no strain hardening characterize plastic flow in this region; furthermore, it was noted that the ease of grain boundary sliding was influenced by texture, an observation which suggests that crystallographic factors contribute to grain boundary sliding. (53 refs.)

- 63342 Microstructure of aluminium during creep at intermediate temperatures. III. The rate controlling process.** D.Caillard, J.L.Martin (Lab. d'Optique Electronique, CNRS, Toulouse, France). *Acta Metall. (USA)*, vol.31, no.5, p.813-25 (May 1983). For pt.II see ibid., vol.30, p.791 (1982). A microscopic picture of the second stage of creep of aluminium at intermediate temperatures has been worked out. The movement of individual dislocations responsible for the main part of deformation during in situ experiments in a high voltage electron microscope is presented. The mobile dislocations are emitted by sources situated inside a few subgrains. They have to cut through subboundaries and this appears to be the rate controlling process. This mechanism which is described as insertion followed by extraction, is studied in detail, as well as annihilation of mobile dislocations in other subboundaries. It is easier than the Orowan process, and it involves cross slip, but no climb. However, the stress necessary is higher than the applied stress, so that extraction requires high local forward internal stresses in subboundaries. The different type of recovery observed—static and dynamic—are discussed, and it is concluded that cross slip is the rate controlling mechanism of creep of aluminium at intermediate temperatures. (36 refs.)
- 63343 Characteristics of plastic deformation of silicon iron single crystals under hydrostatic pressures.** A.V.Dobromyslov, G.V.Dolgikh, N.I.Taluts, V.T.Shtmatov, B.I.Beresnev (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.2, p.374-8 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. A study was made of the influence of hydrostatic pressure on the orientational dependence of the active slip plane in Fe-2.9% Si single crystals. A study of the slip geometry on the stretched and compressed sides of single crystals deformed by bending was made by X-ray structure analysis, and by optical and scanning electron spectroscopy. It was established that the application (during plastic deformation) of a hydrostatic pressure of 550 MPa altered the active slip plane in a certain range of orientations. The changes observed during compression and stretching were attributed to the action of normal stresses and to the special structure of screw dislocations in b.c.c. metals. (11 refs.) *A.T.*
- 63344 Influence of deformation and temperature on the structure and mechanical properties of high-cobalt alloy.** R.N.Eshchenko, V.A.Teplov, G.A.Lyadskaya, B.I.Beresnev (Inst. of Metal Phys., Acad. of Sci., Sverdlovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.2, p.379-84 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. An investigation was made of the phase composition, structure, and mechanical properties of a Co-Ni-Cr-Mo alloy with 50% Co as a function of the degree of deformation in the course of hydroextrusion, temperature of the subsequent heat treatment, and temperatures during mechanical tests. It was found that hydroextrusion could result in a considerable increase in the strength. Recrystallization of the hydroextruded material produced a fine-grain structure characterized by a high plasticity above the recrystallization temperature. Electron-microscopic and X-ray structure data were used to analyze the relationships between the phase composition, structure, and mechanical properties. (9 refs.) *A.T.*
- 63345 Structural mechanism of plastic deformation of Mn-Cu alloys in martensitic state.** S.A.Demin, A.I.Ustinov, K.V.Chuistov (Inst. of Metal Phys., Acad. of Sci., Kiev, Ukrainian SSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.2, p.385-9 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. The dependence of the nature of deformation of Mn-Cu in the martensitic state was determined as a function of the magnitude and direction of external stresses. An X-ray diffraction study of the structural state of the investigated alloys was made in the presence of external stresses. Superplasticity of the martensitic Mn-Cu alloys was attributed to a change in the ratio of the twinning components in the martensite crystals at low deformations and to reorientation of the martensite crystals at high deformations. (9 refs.) *A.T.*
- 63346 Strengthening of cast low-pearlite steels by microalloying with vanadium.** M.S.Mikhalev, E.A.Murav'ev, T.B.Munarova (All-Union Res. Inst. of Railroad Transport, Sverdlovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.2, p.410-12 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. Mechanical properties of over 20 low-carbon steels with different chemical compositions were studied. The effects of adding 0.1% V on the yield stress indicated that the addition of vanadium to normalized cast low-pearlite low-carbon steels was undesirable. (2 refs.) *A.T.*
- 63347 On the origin of the first peak of acoustic emission in 7075 aluminium alloys.** R.Wells (Dept. of Mech. Engng., Univ. of California, Davis, CA, USA), M.A.Hamstad, A.K.Mukherjee. *J. Mater. Sci. (GB)*, vol.18, no.4, p.1015-20 (April 1983). The origin of acoustic emission (AE) in 7075 aluminium alloy was investigated in tension and compression tests. It is suggested that the first peak associated with the root-mean-square (RMS) AE plot against time (or strain) is due to the unpinning of dislocation segments from solute atom clusters and is not due to the fracture of particles. Alteration in the value of the AE first peak and also in electrical resistivity values due to heat treatment of this alloy support the proposed origin of the AE first peak near yield. (32 refs.)
- 63348 Properties of polyethylene-propylene blends. III. Mechanical characterization of ultradrawn fibres.** Ma Rong Tang, R.Greco, G.Ragosta, S.Cimmino (Istituto di Recherche su Tecnologia dei Polimeri e Reologia, CNR, Arco Felice, Italy). *J. Mater. Sci. (GB)*, vol.18, no.4, p.1031-8 (April 1983). For pt.II see ibid., vol.16, p.1001 (1981). High density polyethylene-isotactic polypropylene blends have been analysed using mechanical tensile tests at temperature (T) ranging from 25 up to 150°C and at crosshead speeds ranging from 0.01 to 500 mm min⁻¹. The data have been tentatively interpreted in terms of cold and hot drawing mechanisms, depending on the values of T and v . Such interpretation is quite different from that previously suggested in the literature. Using the results of this analysis it has been possible, by a suitable choice of the operating variables T and v , to yield ultradrawn blend fibres. Their mechanical properties, obtained at room temperature and at a cross-head speed of 10 mm min⁻¹, have been analyzed and discussed. (16 refs.)
- 63349 Effect of creep deformation on microstructural change in 12% Cr heat resisting steel.** T.Tschiyama, T.Fujita (Faculty of Engng., Univ. of Tokyo, Tokyo, Japan). *J. Soc. Mater. Sci. Jpn. (Japan)*, vol.31, no.350, p.1080-5 (Nov. 1982). In Japanese. [received: April 1983]. The effect of creep deformation on microstructural change in 12% Cr heat resisting steel was investigated by comparing the gauge and head regions of creep ruptured specimens. Such microstructural changes as recovery, precipitation rate and coarseness of precipitates were promoted by creep deformation. When the precipitation behavior of the gauge and head regions with the same hardness was compared, the precipitation behavior of the gauge region was smaller in amount, smaller in mean diameter of precipitates and shorter in interparticle spacing, than that of the head region. The promoting ratio of recovery increased with increasing the strain and with lowering the temperature. This result supports the idea that increase in diffusion coefficient by creep deformation promotes microstructural change. (14 refs.)
- 63350 Mechanochemical reaction of polyvinyl chloride at high pressures.** Y.Okuri, N.Dan, Y.Ogo (Faculty of Engng., Osaka City Univ., Osaka, Japan). *J. Soc. Mater. Sci. Jpn. (Japan)*, vol.31, no.350, p.1135-9 (Nov. 1982). In Japanese. [received: April 1983]. The mechanochemical reactions of polyvinyl chloride (PVC) were investigated at room temperature by using a self-made high pressure apparatus capable of simultaneous shear deformation. Static pressures applied were 5, 10, 15 kbar for hard PVC resin and less than 5 kbar for soft PVC resin. The shearing curves for hard PVC resin showed the decrease of shearing stress at the initial stage of shearing because of the occurrence of the major mechanochemical reaction at this stage. The mechanochemical reaction rate and the limiting molecular weight were evaluated by fitting the rate equation to the experimental data on molecular weight of hard PVC resin. All shearing curves for soft PVC resin did not show any definite yield point. Although the addition of plasticizer affected the shearing behavior, the shear-strength under pressure was not appreciably affected by adding over 50 wt.% to pure PVC. No general conclusion about the effect of plasticizer content on the molecular weight was obtained. (6 refs.)
- 63351 Kinking in the drawing of linear polyethylene.** V.A.Marichin, L.P.Mjasnikova (Ioffe Phys. Tech. Inst., Acad. of Sci., Leningrad, USSR), Z.Pelzbauer. *J. Macromol. Sci. - Phys. (USA)*, vol.B22, no.1, p.111-27 (1983). The structure of oriented films of linear polyethylene drawn to an extent such that whitening sets in has been investigated using scanning and transmission electron microscopy. The whitening of the samples was shown to be related to kink band formation. Problems involved in the formation and development of kinks during drawing and their relation to the supermolecular structure of oriented films are discussed. It was found that the process of kinking led to the occurrence of a large number of submicroscopic and microscopic cracks which cause breaking by the samples in the process of drawing. (15 refs.)
- 63352 Effects of complicated deformation history on inelastic deformation behaviour of metals.** Y.Ohashi (Dept. of Mech. Engng., Univ. of Nagoya, Nagoya, Japan). *Mem. Fac. Eng. Nagoya Univ. (Japan)*, vol.34, no.1, p.1-76 (May 1982). In English. [received: March 1983]. The authors have carried out investigations to establish the constitutive equation reflecting history effects from the theoretical viewpoint of continuum mechanics, and in accordance with the experimental results of plastic deformation behaviours of various metals under combined loadings or deformations obtained by using an automatic combined loading testing machine. (33 refs.)
- 63353 On the Portevin-Le Chatelier effect due to Snoek strain aging in the niobium oxygen system.** S.C.Park (Dept. of Materials Sci. & Engng., Univ. of Florida, Gainesville, FL, USA), L.P.Beckerman, R.E.Reed-Hill. *Mettall. Trans. A (USA)*, vol.14A, no.3, p.463-9 (March 1983). Dynamic strain aging in niobium containing between 0.01 and 0.95 at. pct oxygen was investigated between 77 and 971K using a nominal strain rate of $8.8 \times 10^{-3} \text{ s}^{-1}$. At higher oxygen concentrations both type A and type B serrations were observed between 355 and 422K. It is proposed that all of this serrated flow is due to Snoek dynamic strain aging. This is supported by the appearance of the serrations at much lower temperatures than those normally associated with Cottrell strain aging and the observation that the time between the type A serrations on a stress-strain curve equals the jump time of an oxygen atom. Strain rate sensitivity measurements were consistent with the generally accepted view that serrations occur only when the strain rate sensitivity becomes sufficiently negative. (30 refs.)
- 63354 Effect of sulfides and sulfide morphology on anisotropy of tensile ductility and toughness of hot-rolled C-Mn steels.** W.A.Spitzig (Res. Lab., US Steel Corp., Monroeville, PA, USA). *Mettall. Trans. A (USA)*, vol.14A, no.3, p.471-84 (March 1983). The effects of sulfur content (0.004 or about 0.013 pct) and sulfide morphology (stringer or globular) on anisotropy of tensile ductility and Charpy V-notch (CVN) shelf energy were investigated in a series of 0.1 and 0.2 pct carbon, 1.0 pct manganese steels. The effect of sulfide inclusions on fracture strain or CVN shelf energy correlated with a single parameter, P , regardless of inclusion shape, stringer or globular, or test direction, longitudinal, transverse, or through-thickness. The parameter P was defined as the total projected length of inclusions per unit area on a plane parallel to the fracture plane. The fracture strain and CVN shelf energy decreased with an increase in P . The magnitude of P was directly proportional to the volume fraction of inclusions and inversely proportional to the inclusion dimension perpendicular to the fracture plane. The lower ductility in the 0.2 as compared with the 0.1% C steel was a consequence of the greater pearlite in the former steel. It appears that the decrease in tensile ductility with increasing pearlite content is a result of enhanced localized shearing, which promotes the coalescence of voids nucleated at second phases. (20 refs.)
- 63355 Alpha-beta interface sliding in Ti-Mn alloys.** S.Ankem (RMI Co., Niles, OH, USA), H.Margolin. *Mettall. Trans. A (USA)*, vol.14A, no.3, p.500-3 (March 1983). Reports on a brief examination of the effect of volume fraction of α and β phases and their morphology on the unexpected interface sliding behaviour. (15 refs.)
- 63356 Characteristics of structural transformations during deformation and heat treatment of Elinvar alloy 45 NkHt.** V.A.Strizhak, V.V.Kiselev, S.I.Stepanov. *Met. Sci. & Heat Treat. (USA)*, vol.24, no.5-6, p.428-31 (June 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.6, p.44-7 (June 1982). [received: Feb. 1983]. Investigates the fine structure of alloy 45NkHt in relation to various conditions of melting, deformation, and heat treatment, and determine its effect on the properties of the alloy. (4 refs.)
- 63357 Effect of heat treatment in magnetic field on the mechanical properties of carbon steels.** P.I.Rusin, V.N.Pustovit, S.A.Grishin (Rostov-on-Don Inst. of Farm Machine Construction, Rostov, USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.7-8, p.445-7 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.4-5 (July 1982). [received: March 1983]. The authors investigated the changes in the mechanical properties of carbon steels after isothermal treatment in the temperature range of the pearlitic transformation under the influence of magnetic field. The experiments were made with samples of steels 45 and U10A from commercial heats. It was

found that the mechanical properties of carbon steels change under the influence of magnetic field, the character of the change depending on the carbon content. (3 refs.)

63358 Ductility characteristics of thin sheet steel. R.E.Gliner (Gorky Automobile Factory, Gorky, USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.7-8, p.485-7 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.33-5 (July 1982). [received: March 1983]
A method is proposed for determining δ_5 (uniform elongation in tension) from known standard ductility characteristics. The method can be used for evaluating the ductility properties of steels intended for both sheet and bulk cold forming. (3 refs.)

63359 Effect of diffusion welding thermal cycle on the strength of alloy VT20. S.V.Ivanov, E.S.Karakozov, A.Z.Pimenova (Moscow Evening Metall. Inst., Moscow, USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.7-8, p.488-90 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.35-7 (July 1982). [received: March 1983]
Strength properties of alloy VT20 subjected to annealing simulating diffusion welding in the $(\alpha+\beta)$ -region are found to be greater than in the β -region. In using alloy VT20 for structures with stress concentrators in the form of sharp notches under cyclic loading conditions it is recommended that diffusion welding is carried out in the $(\alpha+\beta)$ -region. For structures operating under static loading conditions it is possible to employ welding in the β -region. (3 refs.)

63360 Temperature and rate conditions for development of superplasticity in Zr-2.5% Nb alloy. N.A.Makhutov, L.P.Fedorovich, A.V.Chirkir, B.G.Parfenov, A.I.Tananov (States Sci.-Res. Inst. of Engng., USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.7-8, p.491-4 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.37-40 (July 1982). [received: March 1983]
A study of the mechanical properties and structure of Zr-2.5% Nb alloy during tensile deformation at rates of $2.6 \cdot 10^{-2}$ to $1.05 \cdot 10^{-4}$ sec $^{-1}$ made it possible to establish that isothermal deformation of this alloy in the center of the $\alpha+\beta$ -region at 770°C at a rate of $\sim 10^{-4}$ sec $^{-1}$ proceeded under superplastic conditions. This is confirmed by high elongation (450%) with low values of flow stress, high sensitivity to strain rate ($m=0.7$), the type of true tensile diagram, and also retention of equiaxed grains during deformation. (4 refs.)

63361 Influence of melting method, modification, and cyclic temperature-force action on the ductility of 1V7M6K12 steel. Yu.M.Skrynnchenko, V.N.Terekhov (Sci.-Res. Inst. for Special Steel, Ukrainian SSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.7-8, p.533-6 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.20-3 (Aug. 1982). [received: March 1983]
Vacuum induction remelting and modification were found not to lead to an increase in ductile properties of 1V7M6K12 steel. The impact strength of steel produced by the powder metallurgy method was 1.5-2 times greater than that of normally melted steels but its absolute values were quite low. Cyclic temperature-force action provided a substantial increase in the mechanical properties of the investigated steels. (4 refs.)

63362 Heterogeneity of microstrains in alloy N45KhT specimens under tension. A.A.Vainstein, V.S.Borovikov, V.A.Strizhak, V.V.Kiselev (S.M. Kirov Inst., Ural Polytech., Sverdlovsk, USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.7-8, p.585-8 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.61-3 (Aug. 1982). [received: March 1983]
The heterogeneity of the microstrain field on loading steels and alloys is governed to a significant degree by the heterogeneity of the microstructure. The authors investigated the statistical characteristics of the microstrain field in tensioning alloy N45KhT (EP218) specimens heat-treated in accordance with various regimes. (7 refs.)

63363 Mechanical behaviour of isotactic polypropylene subjected to various strain histories in uniaxial extension. J.M.Crissman, L.J.Zapas (Center for Materials Sci., NBS, Washington, DC, USA). *Polymer (GB)*, vol.24, no.3, p.351-8 (March 1983).
The mechanical behaviour of a slowly quenched isotactic polypropylene has been studied for various strain histories in extension. Creep, constant rate of strain, and constant rate of loading experiments were carried out at deformations up to and beyond the point where necking occurs. A creep diagram, which includes the failure envelope, is presented. From the available data the authors have also obtained an extrapolated surface of the single step stress-relaxation behaviour. From this surface they can calculate, using the Bernstein and Zapas theory on the instability of viscoelastic bars, the deformation at which necking occurs for various strain histories. (10 refs.)

63364 Performance of the Ni-Ti alloy VTN-1 (54.5-55 wt.% Ni) in the case of shape restoration. Yu.A.Granatkin, I.B.Kalachev, G.N.Mekhed. *Russ. Metall. (GB)*, no.6, p.135-9 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.135-40 (1981).
Optimum mechanical properties were achieved after stabilisation annealing in the range 450-500°C. The maximum reactive stress (63 kg/mm 2) was achieved for a predetermined plastic deformation equalling 2.0-2.5%. The optimum operating temperature of thermally sensitive elements made of this alloy, that ensures full restoration of shape with retention of the limit reaction stress, is 250-280°C. The experimental data were used to plot the restoration diagram and to determine the specific work capacity of the alloy within a wide range of predetermined stresses and strains and various rigidity coefficients. The obtained experimental relationships can be used for calculating and designing thermally sensitive elements from alloys with a shape conservation memory. (18 refs.)

63365 Influence of heat treatment on the mechanical properties of dispersion hardening Nb-Zr-N alloys. V.K.Grigorovich, E.N.Sheftel', G.Sh.Uzmanova, V.K.Sul'zhenko. *Russ. Metall. (GB)*, no.6, p.145-9 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.148-52 (1981).
The effect of heat treatment on the short-duration mechanical properties of Nb-Zr-N alloys under tensile stress in the temperature range 20-1200°C was examined. The maximum strength was achieved after quenching from 1600-1700°C (1 h holding) and ageing for 20 h at 1000°C. There was some decrease in ductility. The strength increases with increasing quantity of the strengthening phase. Additional alloying with molybdenum increases the strength and ductility at all the test temperatures. The conditions of heat treatment are given for which the investigated alloys have the maximum strength. (7 refs.)

63366 Examination of the effects of dimensional mismatch of the lattice parameters of the γ and γ' phases on the high-temperature strength of dispersion-hardened nickel alloys. N.V.Petrushin, I.A.Ignatova, A.V.Logunov, A.I.Samoylov, I.M.Razumovsky. *Russ. Metall. (GB)*, no.6, p.150-6 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.153-9 (1981).

The influence was examined of the following alloying elements, wt.%: 2 and 7 Cr; 7 and 11 Co, 0.5 and 1.2 Nb, 8 and 12 W, on the lattice parameters of the γ and γ' phases of the nickel alloys Ni-Cr-Co-W-Al-Ti-Nb-Hf and their dimensional mismatch at 293 and 1173K. An increase in the chromium and tungsten contents reduces the absolute value of the mismatch of the lattice parameters of the phases negatively ($a_{\gamma}-a_{\gamma'}<0$) and positively ($a_{\gamma}-a_{\gamma'}>0$). Cobalt and niobium had no appreciable effect on the dimensional mismatch. Reduced high-temperature strength and considerably differing coefficients of thermal expansion of the phases are achieved in the case of alloying for which the lattice parameter of the γ solid solution is lower than that of the γ' phase. To obtain a high high-temperature strength a certain positive dimensional mismatch (with a low temperature gradient) between the lattice parameters of the γ and γ' phases is necessary. (16 refs.)

63367 Examination of the creep strength of single crystals of high-temperature nickel alloys. V.G.Lyuttsau, E.P.Kostyukova, V.N.Toloraiya, I.V.Kostina. *Russ. Metall. (GB)*, no.6, p.157-61 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.160-4 (1981).

The creep strength of single crystals of the tested high-temperature nickel alloys is higher for single crystals with the orientation [111] than it is in the case of orientations [001] and [011]. During creep, block structures with block dimensions of 0.1-0.2 mm form in the crystals. The transition from the second to the third stage of creep is not accompanied by macro-discontinuities in specimens with a single-crystal structure. Cracks are formed primarily along the carbide segregations at the end of the third stage. (3 refs.)

63368 Superplasticity in an austenitic stainless steel containing aluminium and manganese. E.H.Toscano (Dept. de Materiales, CNEA, Buenos Aires, Argentina). *Ser. Metall. (USA)*, vol.17, no.3, p.309-12 (March 1983).

An Fe-based alloy containing Al and Mn with an austenitic structure at room temperature was tested in tension, in the cold worked state, up to 1073K. At 973K and above the alloy showed a superplastic behaviour due to the precipitation of a second phase which generated a fine grained structure. From the tensile properties at room temperature, it was inferred that the precipitated phase is harder than the matrix causing brittle fracture at room temperature and giving at high temperature a superplastic mode similar to that of a nonNewtonian fluid containing rigid particles. (15 refs.)

63369 Superplasticity in Al-Li based alloys. J.Wadsworth, I.G.Palmer, D.D.Crooks (Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA). *Ser. Metall. (USA)*, vol.17, no.3, p.347-52 (March 1983).

Two Al-Li based alloys have been developed having similar superplastic properties to existing commercial superplastic aluminum alloys, but offering significant weight savings in structural applications, as a result of their higher elastic modulus and lower density. (32 refs.)

63370 Anomalous dynamic superplasticity and quasiliquid condition of iron in the presence of hydrogen. V.I.Shapovalov, V.Yu.Karpov (Dnepropetrovsk Metall. Inst., Dnepropetrovsk, Ukrainian SSR). *Sov. Mater. Sci. (USSR)*, vol.18, no.3, p.224-7 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.38-42 (May-June 1982). [received: Feb. 1983]

A series of experiments was made on determining the influence of hydrogen on the character of appearance of the dynamic superplasticity of iron in its thermal cycling in the $\alpha\rightarrow\gamma$ transformation temperature range. The cycling temperature range was 1123-1223K, and the hydrogen pressure in the gaseous phase was varied from 0 to 100 MPa. The original materials were carbonyl iron containing less than 0.003% impurities and hydrogen with a dew point of 209K. Primarily cylindrical samples with a diameter of 2.5 mm and a length of 5-25 mm were tested. The bending loads were transmitted by their natural weight with single cantilever fastening in a special stainless steel holder. The stress range was 0.2-8 kPa. The tests showed that the presence of hydrogen in thermal cycling leads to an anomalous drop in the yield strength of iron. (14 refs.)

63371 Stress-strain state in the rolling of blanks from granulated alloys. Yu.A.Gorbusov, I.G.Rusov, S.B.Sidel'nikov (Krasnoyarsk Inst. of Nonferrous Metals, Krasnoyarsk, USSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.8, p.617-21 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.21-6 (Aug. 1982). [received: Feb. 1983]

The stressed and strained state in rolling was studied by carrying out experiments on blanks from high-strength granulated alloys of the aluminum-zinc-magnesium-copper and aluminum-zinc-magnesium systems and from aluminum-transition metal alloys. Blanks were produced by compacting granules, which was followed by extrusion and rolling. To the joint or side surfaces of the composite specimens employed were applied coordinate grids with 2-mm-square cells. The coordinate grid cells were measured in the starting and deformed conditions under an MMI-2 microscope with an accuracy to 0.005 mm. (3 refs.)

63372 Structural-mechanical features of two-stage shear strain of oriented low density polyethylene. V.I.Gerasimov, V.D.Zanegin. *Vysokomol. Soedin. Ser. A (USSR)*, vol.25, no.3, p.532-6 (March 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*

The structural transitions and changes of mechanical properties during shear strain of oriented samples of LDPE with crystallites being skewed in the same direction have been studied. The data obtained permit one to evaluate quantitatively the fraction of amorphous-crystalline fibrils and amorphous layers between them. The interfibrillar regions have a complicated structure and various mechanical characteristics dependent on the direction of shear. The recrystallization begins at the attainment of a definite shape of crystallites independent of the initial shape and the value of plastic strain. (9 refs.)

63373 Effect of the annealing on the mechanism of plastic strain in oriented polypropylene. A.V.Efimov, V.P.Lapshin, V.I.Fartinun, P.V.Kozlov, N.F.Bakeev. *Vysokomol. Soedin. Ser. A (USSR)*, vol.25, no.3, p.588-93 (March 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*

The effect of annealing of oriented crystalline polypropylene on its mechanical properties and morphological features of plastic strain in conditions of stretching have been studied. The samples of oriented PP annealed at temperatures close to the melting point are deformed through the formation of specific crazes. For nonannealed samples of oriented polymer and samples being annealed at lower temperatures the plastic strain without the distortion of continuity of material predominates. The prevalence of one of two possible mechanisms of the strain depends on the supermolecular organization of crystalline oriented polymer being changed under annealing. (20 refs.)

- 63374 The effects of molecular weight and cooling rate on fine structure, stress-strain behavior and wear of polytetrafluoroethylene. Ting-Yung Hu, N.S.Eiss, Jr. (Dept. of Mech. Engng., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA). *Wear (Switzerland)*, vol.84, no.2, p.203-15 (15 Jan. 1983). The effects of the molecular weight of polytetrafluoroethylene (PTFE) resin and the cooling rate during the processing of PTFE on its fine structure, stress-strain behavior and wear were investigated. The studies revealed a correlation between the crystallinity, the morphology and the dimensions of the fine structure of PTFE. It was also found that the ultimate strength, ultimate elongation and wear are affected by both molecular weight and crystallinity. An increase in the molecular weight or crystallinity could result in a decrease in wear. However, different effects of both factors on wear were observed when different rubbing conditions were used in wear tests. The different effects might be attributed to a crystalline transition of PTFE at about room temperature. (11 refs.)

- 63375 Evaluation of creep crack growth criteria for IN-100 at elevated temperature. T.D.Hinnerichs (US Air Force Weapons Lab., Kirtland AFB, NM, USA); A.N.Palazotto, T.Nicholas. *AIAA J. (USA)*, vol.21, no.3, p.438-45 (March 1983). Seven crack growth rate criteria from numerical computations of simulated creep crack growth experiments are evaluated. A finite element computer program is utilized to calculate the various parameters. Both nearfield, or local, as well as far-field criteria are examined. The results indicate that environment plays a major role in crack growth in a nickel-base superalloy, IN-100, at 732°C and that time effects must be considered in modelling crack growth using local criteria. Stress intensity and net-section stress are found to be adequate as correlating parameters but are unable to model observed transient phenomena. (22 refs.)
- 63376 Fracture control and its application within the Agency's programmes (space vehicles). G.Reibaldi (ESA Tech. Directorate, ESTEC, Noordwijk, Netherlands). *ESA Bull. (France)*, no.33, p.62-6 (Feb. 1983). Manned space programmes, with all their associated safety issues, have boosted the role of fracture-control techniques for space applications. All payloads to be carried inside the cargo bay of the Shuttle, for example, are subject to stringent fracture-control requirements, to ensure the safety of the crew. It has long been accepted that there are always defects present in mechanical structures due to the rigours of manufacturing, transportation and testing. The science of fracture mechanics that enables one to live with such defects without there being catastrophic structural failures is discussed. (no refs.)
- 63377 Influence of strain ageing of martensite by hydroextrusion on the fine structure and surface relief in ductile fracture of 30KhGSN2A steel. M.N.Spaskiy, Ya.B.Gurevich, V.E.Vaganov, M.S.Astrakhansev (Inst. of Metallography & Phys. of Metals, Moscow, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.2, p.363-7 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. An investigation was made of the mechanical properties and fine structure of 30KhGSN2A steel hardened by a high-temperature thermomechanical treatment and then subjected to strain ageing of martensite involving hydroextrusion. After deformation by 5% at +20°C this process increased the yield and breaking strengths of the investigated steel, but had practically no effect on the plastic properties or on the energy of impact fracture at room temperature. (14 refs.) A.T.
- 63378 Influence of high-temperature thermomechanical treatment on delayed fracture of hardened construction steel. M.A.Smirnov, N.T.Kareva, S.I.Ilin (Lenin Komsomol Polytech. Inst., Chelyabinsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.2, p.392-4 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. Industrial 38KhS steel was subjected to rolling at 900°C and quenching in water. Mechanical tests were made on notched samples. The results indicated that the applied thermomechanical treatment suppressed intergranular fracture and not only effectively weakened embrittlement processes during tempering, but also reduced the embrittlement in the hardened state. (6 refs.) A.T.
- 63379 Investigation of the energy dissipated internally during fatigue of metals. R.M.Chatnyan, V.B.Puz'ko. *Izv. VUZ Mashinostr. (USSR)*, no.12, p.17-20 (1982). In Russian. Procedure is described and experimental results are presented of investigations of the total energy dissipated internally in the process of fatigue of metals, during cyclic extension and compression, with symmetric and unsymmetric stress amplitudes. It is shown that the method proposed can be used for the measurements of the energy dissipated, up to stresses corresponding to the fatigue limits of the materials. (3 refs.) Z.F.V.
- 63380 Indentation-induced cracks in hot-pressed Si₃N₄. D.Chakraborty, J.Mukerji (Central Glass & Ceramic Res. Inst., Calcutta, India). *Indian J. Technol.*, vol.20, no.9, p.361-5 (Sept. 1982). [received: March 1983] Good fitting of Vickers microhardness (VMH) at loads of 1000 g and 2000 g of hot-pressed Si₃N₄ in the Meyer equation indicated that VMH values were not affected by the emergence of cracks VMH measured in planes perpendicular and parallel to the hot-pressing direction of Si₃N₄ did not differ significantly. Length of crack around indentation was found to vary inversely with VMH of hot-pressed Si₃N₄. Fracture toughness of hot-pressed Si₃N₄ was found to vary directly with its VMH. This observation supported the equation derived by previous workers. (18 refs.)
- 63381 Comparison of the impact strength of 10GN2MFA and 15Kh2NMFA steels with the similarity of local failure taken into account. A.D.Zotov, K.L.Ilnitskii (Mfg. Assoc. Atomash, USSR). *Ind. Lab. (USA)*, vol.48, no.6, p.597-602 (June 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.6, p.65-9 (June 1982). [received: March 1983] The authors compared with impact strength of the structural steels, which are used in nuclear reactors, at room and low temperatures. A functional relationship was established between impact strength and critical crack length in fracture for both steels. The use of the similarity criterion of local fracture showed that 10GN2MFA steel had better strength properties. (11 refs.)

63382 Dependence of critical temperatures of brittleness on the condition of operational fractures. N.N. Georgiev, B.G. Kudin (All-Union Sci.-Res. Inst. of Railroad Transport, USSR).

Ind. Lab. (USA), vol.48, no.6, p.602-5 (June 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.6, p.69-71 (June 1982). [received: March 1983]
Using as the basis the analysis of operational failures of a number of parts broken in service in western Siberia, the authors make an attempt to find a scientific basis for the critical work of fracture determined in impact bending tests. The work involved 30 fractures of the parts for which the chemical analysis (steel grade), heat treatment method, and temperature at which the fracture occurred, could be established. In addition, transverse impact specimens with stress concentrators of type 1 (1-mm radius) and type 15 (fatigue crack) were made from the metal near the point of failure and tested at the actual failure temperature. The fractures were divided into three groups: brittle fractures, fatigue fractures with brittle final fracture, and fatigue fractures with tough final fracture. (1 ref.)

63383 Parameter evaluations for polymer durabilities versus time. M.N. Bokshitskii (Neftekhimavtomatika, Moscow, USSR).

Ind. Lab. (USA), vol.48, no.6, p.612-18 (June 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.6, p.76-80 (June 1982). [received: March 1983]
The author proposes a phenomenological classification of endurance curves for brittle failure and develops a procedure for determining the parameters of strength as a function of time. A method for evaluation of safe stress, without a laborious analysis of creep kinetics, is outlined. (11 refs.)

63384 Correlation of hardness and microstructure in unoriented lamellar polyethylene. II. Study of elastic modulus. J.M. Salazar, F.J.B. Calleja (Inst. de Estructura de la Materia, CSIC, Madrid, Spain).

J. Mater. Sci. (GB), vol.18, no.4, p.1077-82 (April 1983).
For part I see *ibid.*, vol.16, p.739 (1981). The stress-strain diagrams of a stress of melt-crystallized polyethylene samples with a varying number of chain defects have been investigated. The elastic modulus, E , and the surface hardness, MH , markedly decrease with increasing number of defects. The mechanical behaviour of the lamellar structure of PE modulated by a major exclusion of chain defects from the crystals is discussed in the light of Takayanagi's two-phase model. The data suggest that E is very sensitive to the fraction of tight crystalline bridges between lamellae. The correlation found between E and MH emphasizes, in addition, the different and complementary role played by the amorphous layer in each mechanical test. In the former case one measures the elastic deformation of the layer reinforced by tie molecules. In the latter test the plastic deformation under compression of the lamellae sandwiched between noncrystalline layers is contemplated. In both cases the influence of the number of defects drastically affects the nature of the crystalline lamellae and surface layer and consequently substantially modifies both types of properties. (10 refs.)

63385 Crack arrest in thick section steel plate. E. Smith (Metall. Dept., Univ. of Manchester, Inst. of Sci. & Technol., Manchester, England).

J. Nucl. Mater. (Netherlands), vol.115, no.1, p.95-100 (March 1983).
Crack arrest in thick section steel plate is considered in relation to the conditions for crack arrest in a nuclear reactor pressure vessel, when this is subjected to thermal stresses resulting from a hypothetical loss of coolant accident. The results of a theoretical analysis, based primarily on recent developments in quasi-static crack propagation theory, provide further support for the view that the arrest toughness K_{Ia} is essentially a material property. However, since the theoretical results also suggest that K_{Ia} is reduced by neutron irradiation and because there is, as yet, no conclusive experimental data on the effect of neutron irradiation on K_{Ia} , it is proposed that with highly irradiated steel, instead of using a K_{Ia} crack arrest criterion, it is better to use a more conservative criterion, based on the concept that arrest occurs within the vessel at a position where the temperature exceeds that temperature above which the cleavage fracture mode is unable to operate. (23 refs.)

63386 Indentation fracture transitions in polymethylmethacrylate. K.E. Puttick, R.H. Yousif (Phys. Dept., Univ. of Surrey, Guildford, England).

J. Phys. D (GB), vol.16, no.4, p.621-33 (14 April 1983).
The temperature transition associated with fracture initiation by ball indentation of polymethylmethacrylate (PMMA) has been studied, and the results compared with the predictions of an energy scaling analysis. It is found that in accordance with the theory (i) the transition temperature, though subject to statistical variability, is a strong function of the size of geometrically similar indentations, (ii) there are two transitions corresponding to (a) the radial fracture of deep plastic-elastic indentations and (b) ring cracking under the quasi-Hertzian stress fields of shallow indentations, (iii) the criterion for fracture is approximately $a_c = \alpha E \Gamma / Y^2$ where a_c is the critical indentation diameter, E is Young's modulus, Y is yield stress in uniaxial testing and Γ is the fracture surface work, α is about 50 for radial fracture and 140 for ring crack initiation. Certain anomalies in the temperature range -10°C to $+10^\circ\text{C}$ are attributed to variation in craze length. There are marked changes in the mode of indentation fracture at low temperatures, where the polymer behaves like an inorganic glass; the transition temperature is also affected by the condition of the specimen surface and the presence at the interface of water and graphite. (18 refs.)

63387 A fracture criterion for edge-bonded bimaterial bodies. P.A. Gradin (Linköping Inst. of Technol., Linköping, Sweden).

J. Compos. Mater. (USA), vol.16, no.6, p.448-56 (Nov. 1982). [received: April 1983]

A fracture criterion for the bond between two different linear elastic materials is proposed. This criterion is based on the singular behaviour of the normal and shear stress in the vicinity of the point of intersection between the bond line and the outer boundary. (4 refs.)

63388 Micromechanical predictions of crack initiation, propagation and crack growth resistance in boron/aluminum composites. J.M. Mahishi, D.F. Adams (Composite Materials Res. Group, Univ. of Wyoming, Laramie, WY, USA).

J. Compos. Mater. (USA), vol.16, no.6, p.457-69 (Nov. 1982). [received: April 1983]

An elastoplastic, axisymmetric finite element model has been used to predict the initiation and propagation of a crack in a composite model consisting of a single broken boron fiber embedded in an annular sheath of aluminum matrix. The accuracy of the axisymmetric finite element model for crack problems has been established by solving the classical problem of a penny-shaped crack in a thick cylindrical rod under axial tension. Also, the stress intensity factors predicted by the present numerical model are compared with continuum results. A constant displacement boundary condition applied during an increment of crack growth permits a substantial amount of stable crack growth in the matrix material. The concept of crack growth resistance curves (K_R -curves) has been used to determine the point of crack instability. (18 refs.)

63389 Notched unidirectional boron/aluminum: effect of matrix properties. E.D. Reedy, Jr. (Sandia Nat. Labs., Albuquerque, NM, USA).

J. Compos. Mater. (USA), vol.16, no.6, p.495-509 (Nov. 1982). [received: April 1983]

The manner in which matrix properties affect the notched behavior of unidirectional boron/aluminum is assessed. Data are presented for center-notched tensile specimens of as-fabricated boron reinforced 1100 and 6061 aluminum. Results are also given for a heat-treated B/6061. The notched response of these materials shows significant differences. A shear-lag analysis, formulated for finite-dimensional monolayers made from work-hardening constituents, is shown capable of explaining such effects. The calculated relation between load and notch opening displacement for a uniform traction boundary condition is indistinguishable from that for a displacement condition when the matrix yield strength is sufficiently high. For such cases, the predicted relation is in excellent agreement with experiment. Specimens with a relatively low matrix yield strength exhibit different behavior: the predicted relation between load and notch opening displacement depends strongly on the type of boundary condition applied. This is a consequence of widespread matrix yielding. (6 refs.)

63390 Energy absorption in composite tubes. P.H. Thornton, P.J. Edwards (Ford Motor Co., Dearborn, MI, USA).

J. Compos. Mater. (USA), vol.16, no.6, p.521-45 (Nov. 1982). [received: April 1983]

The collapse characteristics and energy absorption of a variety of tubes made in glass, graphite and Kevlar fiber composites have been examined. Tubes made from glass or graphite fibers collapsed by a fracture mode. There was a critical range of tube geometry over which stable collapse occurred with high energy absorption; thinner wall tubes tended to collapse in an unstable manner with lower energy absorption. Changes in the lay-up which increased the modulus increased the energy absorption of the tube. Tubes made from, or including Kevlar fiber, tended to collapse in an unstable mode by buckling rather than by fracture, which led to low values for specific energy absorption. (9 refs.)

63391 Tensile fracture of evaporated Au films. IV. T. Hosaka (Inst. of Technol., Kanto Gakuin Univ., Kanagawa, Japan).

J. Vac. Soc. Jpn. (Japan), vol.25, no.12, p.770-4 (1982). In Japanese.

The dynamic tensile fracture of vacuum-evaporated gold films was observed directly in a scanning electron microscope by sticking the film on a rubber substrate with Aron-alpha and then painting the edges with Dotite. Gold films from 2200 to 4000 Å in thickness were heated at different temperatures ranging from 100 to 700°C. The dynamic fracture strain was found to increase as the grain of films was increased approximately 0.5 μm in diameter. The electron microscope observations of the fractured films showed that the fracture propagation occurred along grain boundaries by plastic deformation within the grains. The fracture strain ratio (ϵ_d/ϵ_s) of dynamic and static fracture gold films thicker than about 3000 Å was usually of the order of 1.1 to 1.4. (7 refs.)

63392 Variation of dislocation density during fatigue process of low carbon steel. S. Hattori, T. Tanaka (Faculty of Sci. & Engng., Ritsumeikan Univ., Kyoto, Japan).

J. Soc. Mater. Sci. Jpn. (Japan), vol.31, no.350, p.1061-7 (Nov. 1982). In Japanese. [received: April 1983]

Variation of dislocation density during the fatigue process of 0.1% aluminum-killed carbon steel was explored by the aid of the transmission electron microscopy technique. The fatigue tests were conducted under a constant axial stress amplitude with zero mean stress at a frequency of 30 Hz. The results showed that the dislocation density of about $10^8/\text{cm}^2$ under the annealed state increased with cycles and reached a value of $5 \times 10^9/\text{cm}^2$ at ten percent of the total life. This trend of growth corresponded well to that of plastic strain amplitude. By the analysis of multiplication and annihilation processes of dislocations, the change of dislocation density with the number of stress cycles was expressed by an equation. It was demonstrated that this equation was applicable not only to the present low carbon steel, but also to pure iron, pure aluminum and prestrained S15C steel. (21 refs.)

63393 Fracture of alumina ceramics by application of internal pressure in thin-walled tube under hydrostatic pressure. K. Ikeda, H. Igaki, T. Murakami (Coll. of Engng., Univ. of Osaka Prefecture, Sakai, Japan, M. Hirabayashi).

J. Soc. Mater. Sci. Jpn. (Japan), vol.31, no.350, p.1086-92 (Nov. 1982). In Japanese. [received: April 1983]

The material was fractured by applying internal pressure to a thin-walled tubular specimen with open ends under hydrostatic pressure. The fracture criterion was reexamined by comparing the experimental results with the results obtained previously (see *ibid.*, vol.30, no.328, p.72-7, 1981). The fracture stress plotted in the principal stress space showed a similar tendency to the theoretical results for the fracture criterion obtained by taking account of small cracks in the material, in which the material constants had been decided so as to satisfy the experimental results in bending tests under hydrostatic pressures. Thus, the validity of the assumptions in deriving the theoretical results was confirmed. The experimentally obtained fracture stress was somewhat lower than the theoretical results. This may indicate that the theoretical results include the effect of surface cracks or nonuniform stress distribution. In the fracture criterion, the respective material constants of $\pi K_{Ic}^2/4a$ and K_{Ic}/K_{IIc} were corrected, where K_{Ic} and K_{IIc} are the respective fracture toughness values for mode I and mode II, and a is the radius of a penny-shaped crack. The corrected fracture criterion agreed quantitatively with that determined from the experimental results. (29 refs.)

63394 Fatigue strength under intermittent strain cycling at elevated temperatures (engineering life prediction). T. Okada, T. Horikawa, T. Tsunenari, H. Nakamura (Tech. Res. Lab., Kawasaki Heavy Industries Ltd., Akashi, Japan).

J. Soc. Mater. Sci. Jpn. (Japan), vol.31, no.350, p.1093-9 (Nov. 1982). In Japanese. [received: April 1983]

Fatigue tests have been made on a SUS 316 stainless steel at 550°C under stress patterns of intermittent strain wave form which is composed of cycling of a large pulsating strain and superposed small strain cycling. The method of life prediction for the strain cycling was examined on the basis of a linear cumulative damage concept. A linear rule based on the fatigue life curve under a constant strain amplitude gave a reasonable prediction in the case that the superposed small strain was a larger fraction of the basic large pulsating strain, although it gave a poor prediction in the case that the superposed small strain was a small fraction of the latter. (8 refs.)

63395 Mechanical properties and fatigue strength of steel protected from tuftfridding by inorganic coating. N. Egami (Faculty of Sci. & Technol., Meiji Univ., Nagoya, Japan, C. Kagaya, S. Ishizuka, K. Onishi, M. Kato).

J. Soc. Mater. Sci. Jpn. (Japan), vol.31, no.350, p.1100-6 (Nov. 1982). In Japanese. [received: April 1983]

The fatigue strength and mechanical properties of anti-tuftfridded steel were studied. The non-tuftfridded, tuftfridded and anti-tuftfridded specimens of SS 41 and SM 50 A were used and their hardness, tensile strength and fatigue limit

were measured. The relation between the tensile load on spot welded cross joints and the tufting time was investigated and the fracture surfaces were observed by scanning electron micrographs in order to study the effects of inorganic coating of the antituffrided specimens. Differences in microstructures, hardness, tensile strength and compressive residual stress were apparent between the tufted and antituffrided specimens. But the fatigue limits of both specimens were approximately the same. (19 refs.)

63396 Influence of mean stress on coaxing effect of annealed 0.5% C steel under plane bending fatigue. H.Niisani (Faculty of Engng., Kyushu Univ., Fukuoka, Japan), S.Tanaka.

J. Soc. Mater. Sci. Jpn. (Japan), vol.31, no.350, p.1107-13 (Nov. 1982). In Japanese. [received: April 1983]

The coaxing effect in plane bending fatigue was investigated on the plain specimens of annealed 0.5% C steel under zero and positive mean stresses. The mean stress has hardly any effect on crack initiation, but crack propagation is remarkably affected by the value of mean stress. The fatigue limit, in the case where the mean stress is positive, is controlled by the limiting condition for propagation of a micro-crack. This is closely related to the coaxing effect. The coaxing effect of a plain specimen, in the case where a nonpropagating micro-crack formed under the first stress level is short, is more remarkable than that in the case where the micro-crack is long. The coaxing effect of a plain specimen is bigger in the case of positive mean stress than in the case of zero mean stress. (14 refs.)

63397 Fatigue of concrete under varying repeated load. S.Nishibayashi (Faculty of Engng., Tottori Univ., Tottori, Japan), K.Sakata, S.Inoue.

J. Soc. Mater. Sci. Jpn. (Japan), vol.31, no.350, p.1114-20 (Nov. 1982). In Japanese. [received: April 1983]

In order to understand the effects of various factors on fatigue life of concrete under varying repeated load, two-stage and three-stage stress fatigue tests were performed. The fatigue test results were evaluated statistically. The sum of cycles ratio for the same test condition follows a logarithmic normal distribution. The estimation of fatigue life with Miner's rule predicts on the unsafety side when the initial stress level is higher than the following stress level. The Miner's rule however, may be applicable for the prediction of fatigue life of concrete under varying repeated load when the order of repeated load is uncertain. (7 refs.)

63398 Effects of stress ratio and microstructure on near-threshold fatigue crack propagation in high-strength low alloy steel. Y.Nakai (Dept. of Mech. Engng., Osaka Univ., Suita, Japan), K.Tanaka, M.Yamashita.

J. Soc. Mater. Sci. Jpn. (Japan), vol.31, no.350, p.1121-7 (Nov. 1982). In Japanese. [received: April 1983]

The effects of stress ratio and microstructure on the fatigue crack propagation near the threshold in a high-strength low alloy steel were analysed based on the crack closure measurement and the microscopic observation of fracture surfaces. The effects of microstructure and stress ratio on the relation between the crack propagation rate and the stress intensity range were large in region A near the threshold. The threshold stress intensity range increased linearly with the square root of the mean free path. Region A was dividable into regions A1 and A2 in the relation between the rate and the effective stress intensity range. In regions A2 and B, the rate was expressed in a unique power function of the effective range without respect to the microstructure and the stress ratio. In region A1, very close to the threshold, the rate depended on the microstructure but not on the stress ratio. The transition from region A to B can be caused by either the transition in crack closure behavior or the change in crack growth mechanism. (22 refs.)

63399 Effect of stress frequency on fatigue crack propagation rate in titanium. S.Takezono, M.Sato (Faculty of Engng., Kumamoto Univ., Kumamoto, Japan), K.Kumagai, T.Murakami.

J. Soc. Mater. Sci. Jpn. (Japan), vol.31, no.350, p.1128-34 (Nov. 1982). In Japanese. [received: April 1983]

The effect of stress frequency on fatigue crack propagation in 99.5% pure titanium which has remarkable strain rate dependency in the plastic region was studied. Fatigue crack propagation tests were carried out under three kinds of stress frequencies (0.02, 0.2, 20 Hz). FEM elastovisco-plastic analysis of fatigue crack propagation was performed, and comparison made between the dependency of crack propagation rate on stress frequency and the strain behavior at the crack tip. It was found that the crack propagation rate was approximately in inverse proportion of $f^{1/2}$ ($f > 0$), where f is the stress frequency. The parameter closely related to the fatigue crack growth rate is the strain range $\Delta\epsilon$, or visco-plastic strain range $\Delta\epsilon_p$ at the crack tip. The effect of stress frequency on fatigue crack propagation rate may be explained by the variation of $\Delta\epsilon$ or $\Delta\epsilon_p$ based on the strain rate dependency of material. (22 refs.)

63400 Microstructure and tensile ductility in a β heat treated titanium alloy. D.Banerjee, D.Mukherjee, R.L.Saha, K.Bose (Titanium Alloy Dev. Group of Defence Metall. Res. Lab., Hyderabad, India).

Metall. Trans. A (USA), vol.14A, no.3, p.413-20 (March 1983).

The nature of tensile failure in a β -treated titanium alloy, Ti-6Al-1.6Zr-3.3Mo-0.3Si, is demonstrated to be strongly dependent on cooling rate following β treatment. A characterization of microstructure, the fracture surface of tensile tested samples, and the associated slip behavior shows the fracture mode to be determined by the microstructure as well as composition of the α laths. A martensitic matrix with fine grain boundary α particles leads to intergranular failure. At slower cooling rates, α laths form as side plates from grain boundary allotriomorphs, and an FCC interface phase is present at the α lath/retained β interfaces. This microstructure results in transgranular fracture caused by ductile failure at the α lath/ β interfaces within the grains rather than at grain boundary α . If the composition is equilibrated across the α laths by a long-term anneal following β treatment, the slip mode becomes extremely planar leading to slip band related cracking across the grains. (11 refs.)

63401 Roughness-induced crack closure: an explanation for microstructurally sensitive fatigue crack growth. G.T.Gray, III, J.C.Williams, A.W.Thompson (Dept. of Metall. Engng. & Materials Sci., Carnegie-Mellon Univ., Pittsburgh, PA, USA).

Metall. Trans. A (USA), vol.14A, no.3, p.421-33 (March 1983).

The concept of roughness-induced crack closure is utilized to explain the role of prior austenite grain size and pearlite interlamellar spacing on near-threshold fatigue crack propagation in fully pearlitic eutectoid steel tested at low and high stress ratio in lab air and purified helium. It is shown that at low load ratios, near-threshold growth rates are significantly reduced for coarse-grained microstructures, compared to fine-grained at constant yield strength, due to roughness-induced crack closure. Using roughness-profile microscopy, it was found that fracture surface roughness near threshold scaled with grain size and inversely with yield strength, macroscopic roughness at threshold being considerably larger than the conventionally calculated cyclic crack tip opening displacement. Auger analysis of near-threshold corrosion products showed it to be iron oxide; the oxide thickness was seen to be decreased by increased stress ratio. The significance of this model to near-

threshold fatigue crack growth behavior, in terms of load ratio, microstructure, and environment is discussed. (107 refs.)

63402 High temperature low cycle fatigue of IN 738 and application of strain range partitioning. M.Y.Nazmy (Brown Boveri Res. Center, Baden, Switzerland).

Metall. Trans. A (USA), vol.14A, no.3, p.449-61 (March 1983).

Effects of strain rate and strain wave shape on high temperature low cycle fatigue life of cast IN 738 nickel-base superalloy were investigated at 1123K. Intergranular crack initiation and mixed crack propagation were observed mainly in slow-fast saw tooth wave, slow-slow triangular wave, and in truncated wave with hold time in tension and in both tension and compression tests. A reduction in the fatigue life of the specimens tested under these wave shapes, compared to those under fast-fast type of triangular wave shape, corresponded with a variation in the fracture mode. On the basis of a defined crack initiation criterion the test results were analyzed by the strain range partitioning method proposed by Manson, Halford and Hirschberg. The observation that the wave shape effect on life was very sensitive when examined from the elastic strain range viewpoint suggested that a life prediction method that involves stresses may also be worthy of consideration. (30 refs.)

63403 Improvement in lower temperature mechanical properties of 0.40 pct C-Nr-Cr-Mo ultrahigh strength steel with the second phase lower bainite. Y.Tomita, K.Okabayashi (Dept. of Metall. Engng., Univ. of Osaka Prefecture, Osaka, Japan).

Metall. Trans. A (USA), vol.14A, no.3, p.485-92 (March 1983).

A study has been made of the effect of the second phase lower bainite on lower temperature mechanical properties from ambient temperature (287K) to 123K of a commercial steel corresponding to AISI 4340. When 25 vol pct lower bainite, which appeared in acicular form so as to partition prior austenite grains, was associated with martensite at 473K, it provided a better combination of strength and ductility than that achieved using 1133K direct water quenching irrespective of the test temperature. With the lower bainite, notch tensile strength was dramatically improved over the temperature region studied about 2150 MPa even at 123K; whereas, in the case of 1133K direct water quenching, it remained at about 1700 MPa. Similar trends were observed in the relationship between the lower bainite and the Charpy V-notch impact energy at and above 238K. The lower bainite also produced superior fracture ductility and notch toughness results with decreased temperature of testing as compared to those obtained using a $\gamma \rightarrow \alpha$ repetitive heat treatment for the same steel. The above beneficial effects of the second phase lower bainite on lower temperature mechanical properties are briefly discussed in terms of metallographic examinations, the law of mixtures, and so on. (30 refs.)

63404 Influence of annealing temperature on the character of fracture of 4KhMFSNB cast die steel. D.I.Bron, I.V.Sharmazan, I.I.Levites, Yu.M.Ven'slav (Sci.-Res. Inst. for Automobile Industry Technol., USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.5-6, p.402-5 (June 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.6, p.25-6 (June 1982). [received: Feb. 1983]

An investigation was made of the influence of annealing temperature on the impact strength and character of fracture after tests at different temperatures of samples of cast 4KhMFSNB steel. The annealing was done at 850-1200°C for 15-20 h. To accelerate pearlitic decomposition the samples were tempered at 700°C for 5 h before annealing. The primary qualitative index of the resistance of cast 4KhMFSNB die steel to fracture is the form and character of the fracture of samples. As the result of its low value the impact strength is practically insensitive to a change in heat treatment. The character of the micro- and macrofractures of samples of cast 4KhMFSNB steel is determined by the annealing cycle and test temperature. After annealing at 850°C in all cases fracture of the samples occurs in the interdendritic grain boundaries. An increase in annealing temperature to 1150-1200°C leads to an increase in the share of transgranular fracture. One of the means of increasing the resistance of cast 4KhMFSNB steel dies to brittle fracture is increasing the annealing temperature. (no refs.)

63405 Effect of heat treatment on the fatigue strength of steel 50KhFA and alloy 40KhNMVTYu. V.A.Chernikhin (Cherepovets Nitrogen-Fertilizer Plant, USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.5-6, p.437-8 (June 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.6, p.53-4 (June 1982). [received: Feb. 1983]

The effect of the cooling medium was investigated during the quenching of steel 50KhFA (0.52% C, 0.28% Si, 0.45% Mn, 0.88% Cr, and 0.20% W) and alloy 40KhNMVTYu (0.05% C, 20% Ni, 2.2% Mn, 12.3% Cr, 2.0% Ti, 39% Co, 6.0% W, 4% Mo, and 2.0% Ti) on their mechanical properties and fatigue strength in air and a synthetic-gas medium. Steel 50KhFA specimens were quenched from various temperatures in water glass of different densities. An increase in the density of the water glass from 1.1·10³ to 1.25·10³ kg/m³ increased the fatigue strength of quenched and tempered steel 50KhFA. With a further increase in the density of the water glass, σ_{-1} of this steel decreased. Alloy 40KhNMVTYu was found to possess a high endurance limit in a medium of 80% H₂ + 20% N₂ (synthetic gas) at a temperature of 200°C and pressure of 14.72 MPa as compared with steel 50 KhFA quenched in oil from 850°C and tempered at 230°C. (2 refs.)

63406 Effect of structure on the ductile-brittle transition temperature of molybdenum alloy TsM-6. N.I.Kazakova, N.N.Morgunova, E.N.Ageeva, M.M.Kantor (I.P. Bardin Central Sci.-Res. Inst. of Ferrous Metall., USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.479-81 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.29-30 (July 1982). [received: March 1983]

The authors' studies showed that the highest values of ductile-brittle transition temperatures for alloy TsM-6 in the recrystallized condition are due to intergranular weakening that results from the initial stage of ageing in boundary areas of the alloy. (5 refs.)

63407 Effect of cyclic plastic bending on the proneness of steel St3Sp to brittle fracture. M.S.Podgaikii, A.B.Maksimov, A.V.Belik (Donets Res. Inst. of Ferrous Metals, Donets, USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.498-500 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.43-4 (July 1982). [received: March 1983]

The authors investigated the effect of cycle bending on the proneness of thick sheet of steel St3Sp to brittle fracture, which was evaluated by the change of the stress intensity coefficient, the nominal breaking stress, and also by the temperature of cold shortness. (6 refs.)

63408 Microhardness of nonmetallic inclusions at high temperature. S.I.Gubenko (Dnepropetrovsk Metall. Inst., Dnepropetrovsk, USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.501-3 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.45-7 (July 1982). [received: March 1983]

The properties of nonmetallic inclusions in steels 08kp, 08Yu, 08T, 08YuT, ShKh15, E3, 08Kh, Kh8, Kh18N10T, and 25KhGSA were studied. Inclusion

microhardness was studied at 20-1200°C at intervals of 20-100°C in a vacuum in IMASH-9-66 equipment with indenter loads of 0.01-0.2 N. (4 refs.)

63409 Effect of the test temperature on the microstructure of fractures in gray cast iron. V.I.Koshelov, A.F.Martynenko, S.Z.Fedorenko, N.M.Gumen, I.F.Omel'yankenko (Kharkov State Univ., Kharkov, Ukrainian SSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.7-8, p.557-9 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.40-1 (Aug. 1982). [received: March 1983]

At all the investigated test temperatures (from room temperature to 950°C) the nature of fractured specimens of cast iron Sch21-40 is mixed: sections of intergranular as well as of intragranular failure are found. On the fractures of specimens tested at room temperature, at 550 and 600°C the so-called 'pearlitic' structure is found. Beginning at the test temperature of 550°C, pits—elements of ductile fracture—begin to appear on the fractures of specimens. When the test temperature is raised from 600 to 650°C, the area of ductile fractures and pits greatly increases. Intensive formation of shallow arrow-shaped pits is not accompanied by a substantial increase of ductility. (4 refs.)

63410 Effect of the temperature on crack nucleation in impurities upon deformation of steel 08T. S.I.Gubenko, Yu.V.Yatsenko (Dnepropetrovsk Metall. Inst., Dnepropetrovsk, USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.7-8, p.559-63 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.41-4 (Aug. 1982). [received: March 1983]

Brittle nonmetallic impurities are a source of microcrack nucleation in steel at the early stages of deformation at all the investigated temperatures. The temperature and type of impurities determine their critical size, the critical degree of deformation at which cracks begin to nucleate in the impurities; they determine the interval of deformations in which impurities are the sole source of crack nucleation; the role of impurities in the development of fracture and the number of impurities in which cracks nucleate. The mechanism of the origin of microfracture (cavities or cracks) also affects the investigated parameters. (4 refs.)

63411 Failure mechanism for alloy KhN67VM under the action of a copper-silver solder. V.N.Semenov, L.E.Alekseeva, I.M.Khatsinskaya, E.N.Lubnin. *Met. Sci. & Heat Treat. (USA)*, vol.24, no.7-8, p.566-71 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.47-51 (Aug. 1982). [received: March 1983]

A dispersion-hardened alloy based on Ni-Cr is found to be susceptible to a reduction in strength under the action of solder in the temperature range 850-920°C. Alloy failure under the action of solder is caused by the simultaneous effect of tensile stresses in the alloy and the presence of surface-active fuser solder. The main factor causing a reduction in the tendency of alloy kh67VM towards crack formation (or crazing) during soldering is stabilization of its structure (formation of γ' -phase agglomeration before soldering). (10 refs.)

63412 Reasons for the reduction in the fracture toughness of alloy KhN77TYu-VD at room temperature. M.A.Kotkis, G.P.Kudryavtseva, A.G.Zil'berman (Moscow State Univ., Moscow, USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.574-7 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.53-5 (Aug. 1982). [received: March 1983]

Low values of the fracture toughness at room temperature are characteristic of alloy KhN77TYuR, which fractures in sections with a high concentration of intermetallic hexagonal phase Ni₃Ti. Hexagonal phase can form in alloy KhN77TYuR with increasing amounts of titanium (and iron) and decreasing amounts of aluminum in microvoids due to insufficient homogenization of the solid solution during solutioning. Precipitation of hexagonal phase during deformation is not excluded. (2 refs.)

63413 Development of knowledge about the embrittlement of steels by hydrogen. L. G.M.Pressouyre, J.Dollet (Centre de Recherches Creusot-Loire, Le Creusot, France), B.Vieillard-Baron.

Mem. & Etud. Sci. Rev. Metall. (France), vol.79, no.4, p.161-76 (April 1982). In French. [received: Feb. 1983]

Presents problems of hydrogen embrittlement of steels in production, working and use. The development of methods of study is discussed. Improvements on the present solutions are suggested. (no refs.)

63414 Tenacity, toughness, ductility of mild steel sheet in longitudinal and short transverse direction. H.Aubert, J.Laniese, C.Lelong, M.Pigoury (CENS, Gif-sur-Yvette, France).

Mem. & Etud. Sci. Rev. Metall. (France), vol.79, no.4, p.189-201 (April 1982). In French. [received: Feb. 1983]

Presents a study of the structure and mechanical properties, in the rolling direction and the short transverse direction, of three structural steel sheets with very different inclusion densities. The influence of the structure of ferrite-pearlite zones has been investigated. The difference in the fracture process between the two directions of measurement is discussed. (13 refs.)

63415 Influence of molecular weight on the fracture of poly(methyl methacrylate) (PMMA). P.Prentice (Dept. of Mech. Engrg., Imperial Coll. of Sci. & Technol., London, England).

Polymer (GB), vol.24, no.3, p.344-50 (March 1983).

A model is proposed to explain the dependence of fracture parameters on the molecular weight of glassy polymers. The model assumes that the fracture event occurs in two stages: the first involves the orientation of polymer chain segments between entanglement points and the second, the fracture itself. A value has been calculated, ($\sim 0.6 \text{ J m}^{-2}$), for the fracture surface energy corresponding to the lower critical molecular weight between entanglements, $M = M_e$. Allowing for the simplifying assumptions made in its derivation, this value is in good agreement with that found experimentally. It is proposed that, possible mechanisms are involved; chain 'pull-out' up to a maximum governed by the time scale of the local fracture event, or chain scission. Using the concept of a reptating chain it is proposed that above $M \sim 2M_e$ there is a relationship between the fracture energy (γ) and the molecular weight of the form $\gamma \propto M^2$ up to a critical value of M , above which γ is constant. It has been shown that there is some agreement with experimental relationships determined independently. (34 refs.)

63416 Is it possible to avoid thermal embrittlement in ribbon-shaped glassy metals? C.Janot, B.George, D.Tierlinck, G.Marchal, C.Tete, P.Delcroix (Lab. de Phys. du Solide, Univ. de Nancy I, Vandoeuvre les Nancy, France).

Philos. Mag. A (GB), vol.47, no.3, p.301-13 (March 1983). In French.

A variety of ribbon-shaped metallic glasses of general composition (FeCr)_{~80}(PCSi)_{~20} become brittle far below their crystallization temperature. Bending tests in conjunction with Mossbauer spectroscopy data and positron lifetime measurements show that embrittlement could be due to the onset of precrystalline or microcrystalline layers on each side of the ribbon. Incidental initial brittleness would have a similar origin. (19 refs.)

63417 Mechanical properties of ageing of non-magnetic austenitic steels at low temperatures. M.A.Kablukovskaya, V.M.Blinov, O.A.Bannykh.

Russ. Metall. (GB), no.6, p.130-4 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.130-4 (1981).

Optimal conditions of heat treatment were determined which ensure higher strength and toughness at room and cryogenic temperatures. Steel 40G20N13F (0.39 C, 20.64 Mn, 12.50 Ni, 0.91 V, 0.36 Si, 0.008 S, 0.006 P) exhibited the following properties at +20 and -196°C after quenching from 1100°C and ageing at 650°C for 10 h: $\sigma_{0.2} = 80-110 \text{ kg/mm}^2$, $\sigma_H = 10-12 \text{ kg/cm}^2$. The stainless steel 40Kh14G15N10F (0.34 C, 16.00 Mn, 9.6 Ni, 14.6 Cr, 1.00 V, 0.39 Si, 0.009 S, 0.011 P) exhibited the following properties after quenching from 1150°C and ageing for 10 h at 650°C: $\sigma_{0.2} = 65-120 \text{ kg/mm}^2$, $\delta, \psi < 30\%$; this steel is useful for nonmagnetic highly-stressed parts in cryogenic equipment. Due to the increased technological ductility at elevated temperatures, these steels can be used for manufacturing parts by forging, rolling or stamping. (5 refs.)

63418 Effect of retained austenite on the contact fatigue strength of steel in relation to the phase diagram. B.B.Vinokur.

Russ. Metall. (GB), no.6, p.162-8 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.165-71 (1981).

The influence of temperature and carbon concentration on the contact fatigue strength in steel KhGMF (1.31 Cr, 1.34 Mn, 0.80 Ni, 0.23 Mo, 0.16 V) was examined for two compositions: high-carbon, with a uniform carbon content throughout the volume, and case-hardened (0.19% C in the core with a high-carbon content in the surface layer equal to that of the corresponding high-carbon steels). Both variants were produced with carbon contents of 0.55, 0.70, 0.80 and 0.95%. In the high-carbon steels this was achieved by fractional casting, whilst in the case-hardened steel it was achieved by different conditions of case-hardening (1.8-2.0 mm layer depth). An increase of the carbon content in the high-carbon steel lowers the resistance to pitting formation, whilst an increase in carbon in the case-hardened layer increases the contact fatigue strength. (4 refs.)

63419 Overload induced crack growth rate attenuation behavior in aluminum alloys. R.S.Vecchio, R.W.Hertzberg (Dept. of Metall. & Materials Engrg., Lehigh Univ., Bethlehem, PA, USA), R.Jaccard.

Ser. Metall. (USA), vol.17, no.3, p.343-6 (March 1983).

The influence of baseline stress intensity level on crack growth delay resulting from overload cycles is plotted for two aluminum alloys, 2024-T3 and AC062. The data are described by a 'U-shaped' plot which reflects large amounts of decay at both high and low stress intensity levels, but little delay at intermediate values. Improved component life under variable amplitude loading conditions may be expected if the width of the U-shaped curve could be decreased. (14 refs.)

63420 Mechanism of influence of certain alloying elements on the hydrogen embrittlement of iron. I.I.Vasilenko, Yu.N.Khomitskii, V.P.Koval' (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR). *Sov. Mater. Sci. (USA)*, vol.18, no.3, p.205-9 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.16-21 (May-June 1982). [received: Feb. 1983]

One of the hypotheses of hydrogen embrittlement explains it by the precipitation of hydrogen at dislocations and other defects. Hydrogen, concentrating at a dislocation, may in a significant manner retard its movement, causing embrittlement of the metal. The authors consider the energy of the interaction of a foreign substitutional atom with dislocation, and the field of stresses created around the dislocation. (16 refs.)

63421 Near-threshold growth of short fatigue cracks. O.N.Romaniv, V.N.Simin'kovich, A.N.Tkach (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.3, p.234-9 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.50-7 (May-June 1982). [received: Feb. 1983]

A study is presented of the features of the growth of short fatigue cracks and the establishment of the rules of formation of the threshold stress intensity factors for such cracks. The experiments were made with samples of technical grade iron, 20Kh13 steel in two structural conditions, after annealing and after oil hardening from 980°C, Yu3 austenitic steel, and AMG-61 wrought aluminum alloy. The tensile tests, determination of fracture toughness K_{IC} , and construction of kinetic fatigue failure curves were done in air at room temperature. (20 refs.)

63422 Statistical rules of fatigue crack development. M.N.Stepnov, N.A.Makhtov, A.S.Setegin, A.N.Lisin (K.E. Tsiolkovskii Moscow Aviation Technol. Inst., Moscow, USSR).

Sov. Mater. Sci. (USA), vol.18, no.3, p.250-4 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.70-4 (May-June 1982). [received: Feb. 1983]

Presents the results of a study of the probability rules of failure of AK4-1 and D1 aluminum alloys. The AK4-1 alloy samples were tested in pure bending. The D1 alloy samples were tested in symmetric plane bending with rigid loading. During the tests the crack length, starting with 0.03 mm, was measured. An analysis of the crack growth curves showed that in different samples with the same load the cracks develop at different rates. By graphic differentiation the crack development rates (v , mm/cycle) were determined at the points of measurement of their lengths and the ranges ΔK of the stress intensity factors were calculated. 81.40P Friction, lubrication, and wear

(see also 62.20P Tribology)

- 63423 Influence of ϵ -martensite on the friction and wear of high-manganese alloys. L.G.Korshunov, V.V.Sagaradze, N.A.Tereshchenko, N.L.Chernenko (Inst. of Metal Phys. Acad. of Sci., Sverdlovsk, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.55, no.2, p.341-8 (Feb. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*
- An investigation was made of structural transitions in G21 and 20G18S2F1 alloys during friction. The presence in the structure of the G21 alloy of a considerable amount of ϵ -martensite ($\geq 30\%$) with the h.c.p. crystal structure ensured a low friction coefficient of the alloy ($K=0.27-0.40$) and an increase in the resistance to wear under conditions when the bulk temperature in the surface layer exceeded 100°C . The occurrence of the $\epsilon\rightarrow\gamma$ transition during friction under conditions of strong heating of the surface was responsible for the increase in the friction coefficient and a reduction in the wear resistance of the alloys G21 and 20G18S2F1. (12 refs.) A.T.
- 63424 Particle collisions in the vicinity of an eroding surface. D.R.Andrews, N.Horsfield (Cavendish Lab., Cambridge Univ., Cambridge, England). *J. Phys. D (GB)*, vol.16, no.4, p.525-38 (14 April 1983).
- In the vicinity of a surface which is being eroded there is a region where particles arriving at and departing from the surface can collide. The frequency of collisions and the resulting motion of spherical particles have been investigated theoretically and experimentally. An expression is derived for the flux of spheres necessary for a high frequency of collisions. The directions and velocities of particles after collision have also been calculated, assuming elastic collisions. In the low-flux limit collisions do not reduce the number of particles reaching the surface. Long-exposure (ca. 1 s) and high-speed (5000 frames s^{-1}) photography confirms these findings for the case of 0.6 ± 0.1 mm diameter glass spheres travelling at 13 ± 1 m s^{-1} . These conclusions conflict with the ideas of many authors who suggest that collisions help protect the eroded surface. The present paper shows that collisions degrade the incident beam of particles by increasing the angular divergence of the beam and creating a spectrum of velocities. Stray particles have also been observed entering the region of interest, increasing the frequency of collisions. Stray particles and changes in the incident beam are probably the causes of the observed reduction in erosion rate at high levels of flux. (25 refs.)
- 63425 Optimizing the carbon and manganese concentrations in wear-resistant chromium cast irons. E.V.Rozhkova, O.M.Romanov (All-Union Sci.-Res. & Design-Technol. Inst. of Coal Mining Machine Construction, USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.5-6, p.418-20 (June 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.6, p.36-8 (June 1982). [received: Feb. 1983]
- Concerns the combined effect of manganese and carbon on the abrasive (microcutting) and impact-abrasive wear resistance of chromium cast irons. The composition of cast iron intended for operation under abrasive wear conditions must be selected with at least two parameters kept in mind. The carbon and manganese concentrations have different effects on the abrasive and impact-abrasive wear resistant of cast iron. The abrasive wear resistance of cast iron rises with increasing amounts of carbon and drops with increasing amounts of manganese. (2 refs.)

- 63426 Influence of structure on the wear resistance of alloys. A.I.Stepina, L.I.Sidorova, E.V.Tolstenko (All-Union Sci.-Res. for Mechanization in Ferrous Metall., USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.5-6, p.438-40 (June 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.6, p.54-5 (June 1982). [received: Feb. 1983]
- An investigation was made of wear resistance of irons and steels with wear of the samples by a flow of abrasive particles moving at angles of 20° and 90° to their surface. The kinetic energy of an abrasive particle reaching the surface of the sample at angles of attack of 20° and 90° was 4446 and 13000×10^{-7} J, respectively. It was found that under conditions of gas-abrasive wear and wear resistance of alloys is determined by their structure and hardness. During abrasive wear the surface layers of the alloys were intensely work hardened. Failure of the surface layers during abrasive wear occur only after reaching a certain value of microhardness and physical width of the diffraction line. For austenite steel these are H450-500 and $\beta(311)=0.035-0.045$ rad and for ferrite $\beta(211)=0.015-0.023$ rad. (3 refs.)
- 63427 The determination of the coefficient of dynamic friction of organic powder compacts on steel. M.B.James, J.M.Newton (Pharmacy Dept., Univ. of London, London, England). *Powder Technol. (Switzerland)*, vol.34, no.1, p.29-37 (Jan.-Feb. 1983).
- A practical experimental model system has been successfully used to study the frictional response of organic powder compacts sliding across a polished steel plate, representative of the die bore of a production compaction system. This system offers a controlled approach to the study of frictional phenomena occurring during compaction and facilitates a more detailed investigation into the fundamental mechanisms of friction than a simple resolution of forces within a punch and die apparatus. For acetylsalicylic acid sliding on steel, the dynamic friction coefficient was found to be dependent on the displacement and, to a lesser extent, the initial normal load, whereas for PTFE on steel, the dynamic friction coefficient was independent of displacement and load and estimated at 0.09. Thus, soft organic materials exhibit very different frictional characteristics to those of brittle materials. These differences reflect the differing importance and magnitude of the three frictional components, adhesion, shear and ploughing. (22 refs.)
- 63428 Nitriding kinetics and wear resistance of titanium alloys. D.P.Shaskov, A.V.Vinogradov, V.N.Polokhov. *Russ. Metall. (GB)*, no.6, p.168-73 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.172-7 (1981).
- The materials investigated were pure titanium grade VT1-0, $\alpha+\beta$ titanium alloy VT22, and the compound NiTi containing 54% Ni and 46% Ti. With increasing temperature and nitriding time, the thickness of the diffusion layers increases; in the case of NiTi the nitrided layer consists basically of a very hard titanium nitride. Examinations of the depth-distribution of the microhardness of the nitrided layer shows that the greatest increase in surface hardness occurred in the NiTi, its nitriding temperature being much lower (500°C) than for titanium or for the alloy VT 22 ($900-1000^\circ\text{C}$). The wear resistance after nitriding was higher by several orders of magnitude for NiTi than for the titanium and the VT22 alloy. Therefore, the alloy NiTi is recommended for parts subjected to intensive wear in low-noise equipment where a high strength in the core of the material is not required. (4 refs.)
- 63429 Thermally stressed condition occurring in the surface layers of flat parts during friction hardening. Yu.I.Babei, R.I.Glek, M.D.Maksimishin, N.A.Zhuravleva (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR). *Sov. Mater. Sci. (USA)*, vol.18, no.3, p.254-7 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.75-8 (May-June 1982). [received: Feb. 1983]
- A part being subjected to friction hardening is simulated by a half-space. Since the maximum contact tangential stresses, which are primarily responsible for heating of the zone of contact, occur at a certain distance from the surface, in this problem the case of subsurface location of the heat source is discussed. An elastic semiinfinite body is considered. The choice of the coordinate system is made in such a manner that the y and z axes lie on the faces of the body and the x axis is directed into the depth. (4 refs.)
- 63430 Influence of production media on the physicochemical and electrochemical properties of steels. V.E.Shestopalov (Lenin Komosomol Lvov Polytech. Inst., Lvov, Ukrainian SSR). *Sov. Mater. Sci. (USA)*, vol.18, no.3, p.285-7 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.107-9 (May-June 1982). [received: Feb. 1983]
- The results are presented of an investigation of the influence of a new form of production medium, polymer-containing, on the physicochemical and electrochemical properties of constructional steels. The use of polymer-containing media as production media leads to the occurrence of a process of thermomechanicochemical working, the effectiveness of which is determined by the presence, concentration, and nature of interaction of the products of breakdown of the polymer components of the production medium with the fresh surface of the metal. Water emulsion lubricating and cooling liquids based on ET-2 self-emulsifying oil, industrial production lubricants, and types MKhO polymer-containing production media were used as the production media. (7 refs.)
- 63431 Sliding friction behaviour of polymer-polymer material combinations. G.Erhard (BASF AG, Ludwigshafen, Germany). *Wear (Switzerland)*, vol.84, no.2, p.167-81 (15 Jan. 1983).
- The intermolecular bonding energies of polymeric materials can be employed in the evaluation of sliding under conditions determined predominantly by adhesion. The effect at the interface of these energies can be evaluated by reference to the surface energy and to its polar and dispersion-related components. Wetting angle measurements were used to determine the work of adhesion for a group of polymer-polymer material combinations. An exponential relationship exists between the work of adhesion and the coefficients of friction of these combinations, these coefficients of friction being determined primarily by adhesion. (22 refs.)
- 63432 Residual stresses and sliding wear. J.W.Ho, C.Noyan, J.B.Cohen (Dept. of Materials Sci. & Engng., Northwestern Univ., Evanston, IL, USA), V.D.Khanna, Z.Elizeer. *Wear (Switzerland)*, vol.84, no.2, p.183-202 (15 Jan. 1983).
- The residual stresses that develop during the wear of AISI-SAE 1018 and 4340 steels have been examined. The entire three-dimensional stress tensor was obtained. A normal stress perpendicular to the surface, predicted by theory, has been found, but its magnitude is too small to affect the wear rate. There are also significant shear stresses. The wear process rapidly alters any initial stress distribution produced by heat treatment or peening to such a degree that the wear rate is not affected by these stresses, unless they are initially larger than those that can be produced by the wear parameters. (21 refs.)

- 63433 An analysis of the localization of deformation and weight loss during single-particle normal impact. G.Sundararajan (Dept. of Metall. Engng., Ohio State Univ., Columbus, OH, USA). *Wear (Switzerland)*, vol.84, no.2, p.217-35 (15 Jan. 1983).
Localized lip formation and subsequent lip fracture is the dominant mechanism by which material is removed during the normal incidence of single spherical particles on ductile targets. A theoretical model which predicts the extent of lip formation as well as the weight loss during these single impact experiments is presented. The model postulates that the lip formation is the result of localization of deformation in the near-surface regions of the target and that the lip is removed either by inertial-stress-induced tensile fracture or by separation across adiabatic shear bands formed at the base of the lip. The single-impact data for copper, brass, thorium dispersed (TD) nickel and nickel targets are shown to compare very well with the predictions of the model. (17 refs.)

- 63434 Changes in resistivity at low-temperature deformation and the subsequent recovery of the Ag-15 at.% Al alloy. V.S.Zubchenko, P.V.Petrenko, O.O.Tatarov. *Dopov. Akad. Nauk UkrSR. Ser. A (USSR)*, no.2, p.76-8 (1983). In Ukrainian.
- It is shown that in low-temperature deformation and subsequent annealing of the Ag-15 at.% Al alloy changes in electroresistivity are due to the ordering processes. (6 refs.)
- 63435 Heat treatment and magnetic properties of high-coercivity Fe-Co-Cr alloys with 3% Mo. B.A.Samarin, V.S.Shubakov, L.B.Vul'f (Moscow Inst. of Steel & Alloys, Moscow, USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.5-6, p.431-4 (June 1982). Translation of: *Metall. & Term. Obrab. Met. (USSR)*, vol.24, no.6, p.47-50 (June 1982). [received: Feb. 1983]
- Concerns the effect of molybdenum on the phase composition and magnetic properties of Fe-Co-Cr alloys with 15% Co and 25-35% Cr after various heat treatments. Alloying with molybdenum makes it possible to lower the quenching temperature to α solid solution of Fe-15% Co + (20-35%) Cr alloys, although the hot plastic deformation temperature must be raised due to the broader range in which the σ phase exists. The addition of molybdenum lowers the initial temperature of high-coercivity decomposition and leads to $H_c = 60-48$ kA/m without reducing the level of magnetic energy. (4 refs.)
- 63436 Effect of antimony on the magnetic properties and grindability of alloy YuND4. A.A.Bezuglov, G.N.Buzuglova, N.I.Sannikov (Shakhty Technol. Inst. of High-Speed Servicing, USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.5-6, p.434-6 (June 1982). Translation of: *Metall. & Term. Obrab. Met. (USSR)*, vol.24, no.6, p.50-2 (June 1982). [received: Feb. 1983]
- The effect of antimony additives (up to 1% by weight) on the magnetic properties, structure, and grindability of alloy YuND4 (25% Ni, 14% Al, 4% Cu, and the remainder Fe) was investigated. It was found that alloying with 0.2% of Sb and less does not give rise to an increase in the magnetic properties of alloy YuND4, but, conversely, effects their reduction. Analysis of the results indicated that an additive of 0.25% of Sb is optimum, since alloy YuND4 with 0.25% of Sb exhibits the best combination of magnetic energy and residual induction at a rather high coercive-force level. - 63437 On the theory of stress-assisted diffusion. II. D.J.Unger, E.C.Aifantis (Univ. of Minnesota, Minneapolis, MN, USA). *Acta Mech. (Austria)*, vol.47, no.1-2, p.117-51 (1983).
For pt.I see *ibid.*, vol.45, no.3-4, p.273 (1982). Similarity and general steady-state solutions of a recently developed stress-assisted diffusion theory are derived. General transient solutions are obtained analytically for certain classes of stress distributions. For general stress distributions a perturbation method is employed to produce transient solutions. Under appropriate conditions the derived solutions are reduced to previous formulae that have unsystematically appeared in the literature. Examples of interesting crack problems involving stress singularities as well as the elimination of singularities are considered. An equilibrium solution is utilized together with a straightforward physical argument to produce rationally two empirical formulae previously proposed in the literature to model embrittlement and stress corrosion cracking phenomena. This solution is further used to model embrittlement and stress corrosion cracking data more successfully than previous attempts. An appendix on certain preliminary elastodiffusive fracture criteria is given. (44 refs.)
- 63438 Microstructure and ductility of electroless copper deposits. S.Nakahara, Y.Okinaka (Bell Labs., Murray Hill, NJ, USA). *Acta Metall. (USA)*, vol.31, no.5, p.713-24 (May 1983).
Transmission and scanning electron microscopes were used to characterize the microstructures of electroless copper deposits plated on large-grained copper sheets, amorphous Pd-Cu-Si alloy, and SnCl_2 -PdCl₂ activated plastic substrates. Nucleation and growth patterns were found to depend markedly on the type of substrate. The presence of a large number of small gas bubbles containing hydrogen is characteristic of these deposits. The effect of these bubbles on film ductility is discussed and shown to cause hydrogen embrittlement in the copper films. (37 refs.)
- 63439 Anodic oxidation of GaAs in oxygen plasma and qualitative analysis of anodic oxide films by AES and XPS. Zhang Guansheng, Tang Houshun, Huang Dusen, Yu Xitong (Fudan Univ., Shanghai, China). *Chin. J. Semicond. (China)*, vol.4, no.2, p.181-6 (March 1983). In Chinese.
The anodic oxidation of GaAs is carried out in an oxygen plasma generation by RF glow discharge. The diameter of the wafer is 40 mm. The grown films are amorphous and uniform. The breakdown electric field of the oxide is $\approx 10^6$ V/cm⁻¹, their resistivity is 10^{15} Ω -cm and the refractive index is 1.83-1.85 ($\lambda = 6328$ Å). According to the analysis of the oxide films by AES-XPS the in-depth profiles for the as-grown anodic oxide display three distinct layers: the first is an arsenic-deficient layer near the surface with a thickness of ~ 100 Å; the second layer, a center region, has a nearly constant composition in depth, the concentration ratio of gallium and arsenic is 1.2-1.6; and the third layer comprises the transition region from the oxide GaAs. (8 refs.)
- 63440 Anisotropic etching of silicon: a model diffusion-controlled reaction. D.M.Allen, I.A.Routledge (Cranfield Inst. of Technol., Cranfield, England). *IEE Proc. I (GB)*, vol.130, no.2, p.49-56 (April 1983).
In conventional isotropic etching of metals, it has been found that narrower slot take longer to etch than wider ones. This has been attributed largely to the restricted access of fresh etchant to the metal surface. Spent etchant remains at the metal surface and forms a physical etch-retarding barrier. Anisotropic etching of single crystals differs from isotropic etching, in that it is orientation dependent, and different crystal planes are etching at different rates under identical conditions. This investigation examines anisotropic etching of (110) silicon for different slot widths and compares it with the already available information on isotropic etching of metals. (10 refs.)
- 63441 Structure in carbon/carbon fibre composites as studied by microscopy and etching with chromic acid. J.A.Forrest, H.Marsh (Northern Carbon Res. Labs., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England). *J. Mater. Sci. (GB)*, vol.18, no.4, p.973-7 (April 1983).
Structure of the matrix carbon in two industrially prepared carbon/carbon fibre composites and in four composites prepared in the laboratory was studied using optical microscopy and SEM examination of surface topography after oxidation in chromic acid solution. In the industrial composites and in the laboratory composites prepared with PAN fibres, the orientation of the basal planes of the matrix carbon is parallel to the fibre length within ~ 5 μ m of the fibre. The fibre-matrix interface is an area of weakness. Use of CVD coated carbon fibres, however, prevented this alignment; here the basal planes of the matrix carbon are randomly aligned relative to the surfaces of the fibres. (10 refs.)
- 63442 The environmental stress corrosion cracking of glass fibre-reinforced laminates and single E-glass filaments. F.R.Jones, J.W.Rock, J.E.Bailey (Dept. of Metall. & Materials Technol., Univ. of Surrey, Guildford, England). *J. Mater. Sci. (GB)*, vol.18, no.4, p.1059-71 (April 1983).
The environmental stress corrosion cracking of epoxy/glass fibre crossply, unidirectional coupons and single E-glass filaments have been compared. At initial applied strains $>0.15\%$ the resin does not protect the fibres as shown by their equivalent failure times. The failure occurs in the environment and planar fractures occur because of the localized stress in the load bearing plies adjacent to a transverse crack in the 90° ply of the 0°/90°/0° coupons. These transverse cracks result from stress corrosion on the glass/resin interface, which leads to a reduction of the transverse cracking strain. At applied strains $<0.15\%$ fracture occurs within the unexposed half of the coupons and is thought to be caused by rapid transport of glass corrosion products where they crystallize within the coupon. This phenomenon is also responsible for the progressive transverse cracking that occurs in both the 0° and 90° plies of the unimmersed half of the crossply coupon under zero load. (28 refs.)
- 63443 The performance of mechanical scraping tools in ultrahigh vacuum: an XPS study. M.S.Lazarus (Dept. of Chem., Herbert H. Lehman Coll., City Univ. of New York, New York, NY, USA), T.K.Sham. *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.31, no.1, p.91-6 (April 1983).
The authors examine some of the considerations to be borne in mind when cleaning a sample surface, with emphasis on the scraping technique. In particular, comparisons are made between mechanically scraped surfaces and Ar⁺-etched surfaces of two materials. The importance of choosing the best scraping device for a particular surface is discussed. In general, they conclude that it is better to scrape the surface than to Ar⁺-etch it. (3 refs.)

- 63444 Ion etching of InP-InGaAsP heterostructures.** M.N.Zargar'yants, V.V.Krapukhin, I.A.Krykanov, N.B.Kagan. *Sov. Phys. Tech. Phys. (USA)*, vol.27, no.10, p.1291-2 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2102-4 (Oct. 1982). [received: April 1983]
The authors' purpose is to see if ion etching can be used to monitor the layer thicknesses and geometry of heterojunction boundaries in multilayer heterostructures, and to select optimal conditions for ion etching InP-InGaAsP heterostructures. The well-established experimental dependence of the ion sputtering rate on the composition of the sputtered material makes it possible to identify the heterojunction boundaries in semiconductor heterostructures. The three-electrode gas discharge ion source with magnetic field was used in the etching experiments. The authors studied how the depth of the etching details produced on the heterojunction boundaries depended on the ion beam current and found that for argon ions of energy 5 keV, details large enough to be observed in the scanning electron microscope are produced at current densities $(2-3) \times 10^{15} \text{ cm}^{-2}$. For the current densities in the ion source used this dosage was reached after 8-80 s. (9 refs.)
- 63445 The photoelectrochemical etching of TiO_2 single crystals.** A.Praet, F.Vanden Kerchove, W.P.Gomes (Lab. voor Fysische Scheikunde, Rijksunivers. Gent, Gent, Belgium), F.Cardon. *Sol. Energy Mater. (Netherlands)*, vol.7, no.4, p.481-90 (Jan.-Feb. 1983).
The photoelectrochemical behaviour of mechanically polished TiO_2 (rutile) single crystal electrodes was followed as a function of time during photoelectrochemical etching of the surface in acid solutions. It was found that, as a consequence of this treatment, not only the shape of the photocurrent-voltage curve changed, but that also the limiting photocurrent increased over one to two orders of magnitude. The results, combined with analytical data on the corrosion rate, were interpreted quantitatively by a model in which it was assumed that a damaged surface layer, containing a large number of recombination centers as a consequence of the polishing treatment, is gradually removed by photoelectrochemical etching. The usefulness of this photoelectrochemical etching treatment in research on photoelectrochemical solar cells is discussed. (20 refs.)
- 63446 Quantum chemical models of elementary steps concerning plasma etching in the F/Si system.** D.K.Fricke, H.Müller (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany). *Wiss. Z. Friedrich-Schiller-Universität Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.895-905 (1982). In German.
The authors make calculations of the microscopic processes of plasma etching on an atomic level. They use the cluster model of solid and a semiempirical quantum chemical method (extended Hückel-MO) for the calculation. Using the extended Balloon-effect, a proposal is given of the mechanism of plasma etching of silicon with fluorine. (30 refs.)

(inc. stress corrosion cracking; anticorrosion)

- 63447 Anodic dissolution behaviour of Si- and Ti-implanted iron.** Y.Okabe (Dept. of Electronic Engng., Faculty of Engng., Saitama Inst. of Technol., Saitama, Japan), M.Iwaki, K.Takahashi, K.Yoshida. *Jpn. J. Appl. Phys. Part 2 (Japan)*, vol.22, no.3, p.L165-7 (March 1983).
Effects of silicon and titanium ion-implantations on anodic dissolution behaviour of iron have been investigated by multisweep cyclic voltammetry in acetate buffer solution (pH~5), secondary ion mass spectrometry and scanning electron microscopy. Ion-implantations have been carried out with a dose of $1 \times 10^{17} \text{ ions/cm}^2$ at an energy of 150 keV at room temperature. It is found that electrochemical properties of Si^{+} - and Ti^{+} -implanted irons are more inert than that of pure iron. Anodic dissolution phenomena of ion-implanted

irons are discussed in relation to the shape of an electrochemically corroded surface observed by SEM and to the concentration profiles of implanted atoms measured by SIMS. (10 refs.)

- 63448 Inhibition of corrosion of aluminium in nitric acid by some carbohydrates.** C.Chakrabarty, M.M.Singh, C.V.Kagarwal (Appl. Chem. Section, Inst. of Technol., Banaras Hindu Univ., Varanasi, India). *Indian J. Technol.*, vol.20, no.9, p.371-2 (Sept. 1982). [received: March 1983]
Inhibitive effect of fructose, sucrose, glucose and fructose on the corrosion of aluminium in 20% nitric acid has been evaluated at 35°C by weight loss and potentiostatic methods. All the additives used showed certain degree of inhibition at all the concentrations tested. Lactose is found to be the most efficient at almost all the concentrations, followed by fructose and glucose. Sucrose showed very poor inhibitive effect at lower concentrations. (11 refs.)
- 63449 A surface treatment for Ti-6Al-4V.** T.Smith (Rockwell Internat. Sci. Center, Thousand Oaks, CA, USA). *J. Adhes. (GB)*, vol.15, no.2, p.137-49 (1983).
A simple nonchromate surface treatment that was developed for aluminum alloys (STAB(3)) has been found to provide Ti-6Al-4V, bonded with epoxy adhesives, with good hydrothermal endurance. The simplest form of the treatment is to degrease, dip in caustic soda, hard (i.e. forceful) spray-rinse and dry. A steel wool scrub prior to the NaOH dip enhances durability. Surface property measurements following the surface treatment indicate that a porous oxide layer is formed on top of a 300 Å barrier layer. The durability of this treatment is attributed to mechanical interlocking between the adhesive and the porous oxide (hydroxide) and to the chemical stability of the oxide (hydroxide) under hydrothermal stress. (18 refs.)
- 63450 Polymer-aluminium adhesion. I. The surface energy of aluminium in relation to its surface treatment.** A.Carre (Centre de Recherches sur la Phys., Chimie des Surfaces Solides, CNRS, Mulhouse, France), J.Schultz. *J. Adhes. (GB)*, vol.15, no.2, p.151-61 (1983).
The influence of different surface treatments (degassing, phosphatization sealed and non-sealed anodization) on the surface energy of an aluminium substrate has been examined. The surface energy has been determined by wettability measurements using the two liquid phase method and taking into account the roughness and porosity of the treated substrate. The comparison of the interfacial interaction energies Al/polymer and Al/water shows that the treatment leading to the highest γ_{p} value and the lowest surface polarity, i.e. phosphatization, gives the highest adhesion strength and the best moisture resistance of the metal/polymer assembly. (22 refs.)
- 63451 Effect of film thickness on oxidation of vacuum-deposited films of iron.** K.Maki, T.Kurumi, K.Nishi, Y.Terawa (Dept. of Phys., Yokohama City Univ., Kanagawa, Japan). *J. Magn. & Magn. Mater. (Netherlands)*, vol.35, no.1-3, p.223-5 (March 1983). (Proceedings of the 10th International Colloquium on Magnetic Films and Surfaces, Yokohama, Japan, 13-16 Sept. 1982).
Iron films at thicknesses below 4 Å change in an oxidized phase immediately after exposure to air. Electron micrographs of such thin films show a uniform contrast. This suggests that the films are composed of fine particles with sizes smaller than a few ten Å. (4 refs.)
- 63452 The development of nitrogen concentration profiles on nitriding iron.** H.C.F.Rozendaal, E.J.Mittermeijer, P.F.Colin, P.J.Van Der Schaaf (Lab. of Metall., Delft Univ. of Technol., Delft, Netherlands). *Metall. Trans. A (USA)*, vol.14A, no.3, p.395-9 (March 1983).
On nitriding iron specimens nitrogen concentration profiles within the specimens are built up. A numerical method for the calculation of such concentration profiles was developed. The results calculated were compared with experimental data. It was found that during nitriding the nitrogen surface concentration approached relatively slowly the equilibrium value. This effect strongly influenced the development of nitrogen concentration profile. The model predicted correctly the incubation time for compound (i.e. iron nitride) layer formation at the surface. If the fatigue resistance is strongly dependent on the (compressive) residual surface stress, the present treatment allows calculation of an optimum nitriding time by determining when the maximum (compressive) residual surface stress occurs. (18 refs.)
- 63453 Intergranular zinc embrittlement and its inhibition by phosphorus in 55 pct Al-Zn-coated sheet steel.** L.Allegre, R.G.Hart, H.E.Townsend (Sheet Steels & Coated Products Div., Res. Dept., Bethlehem Steel Corp., Bethlehem, PA, USA). *Metall. Trans. A (USA)*, vol.14A, no.3, p.401-11 (March 1983).
Room-temperature tensile and bend tests and Auger electron spectroscopy (AES) were used to study embrittlement in sheet steels coated with a 55 pct Al-Zn alloy and then heated in the range 316 to 538°C for up to 5000 hours. The results of these studies show that embrittlement is caused by diffusion of Zn from the coating into the ferrite grain boundaries of the steel substrate, reducing intergranular cohesion. The activation energy for grain boundary diffusion of Zn in iron is estimated at 89 kJ/mole. When present in the steel in concentrations of at least 0.04 pct by weight, P is shown to prevent embrittlement by preemptively segregating to the ferrite grain boundaries where it blocks intergranular diffusion of Zn. (10 refs.)
- 63454 Characteristics of controlled atmospheres with 20% and 40% H_2 during carburizing and carbonitriding.** A.K.Tikhonov, B.E.Sheindlin, S.Z.Chaikovskii, M.A.Krishtal (Volgograd Truck Plant, Tol'yatti Polytech. Inst., USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.5-6, p.411-15 (June 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.6, p.30-3 (June 1982). [received: Feb. 1983]
Concerns the possibility of using an exo-endothermic (20% H_2) and endothermic atmosphere (40% H_2) as a gas carried for chemothermal treatment. It was necessary to determine the effect of the hydrogen concentration in these atmospheres on the mechanical properties of steels and also on the saturation rate during carburizing and carbonitriding. Use of a controlled atmosphere with 40% H_2 for carburizing leads to some increase in the thickness of the layer as compared with that obtained in an atmosphere with 20% H_2 . However, the acceleration of the carburizing process in the atmosphere with 40% H_2 gives it a slight advantage under production conditions. The use of a controlled atmosphere with 40% H_2 in place of 20% H_2 for carbonitriding does not change the saturation rate. Thus, the productivity is practically identical in carburizing and carbonitriding in atmospheres with 20 and 40% H_2 . The mechanical properties of samples treated in an atmosphere with 20% H_2 are superior to those of samples treated in an atmosphere with 40% H_2 . (9 refs.)
- 63455 Improving the technique of boriding from pastes.** N.N.Mitrokhovich, V.P.Fetisov, N.N.Lipchin (Perm Polytech. Inst., USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.5-6, p.415-17 (June 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.6, p.34-5 (June 1982). [received: Feb. 1983]
The possibility of increasing the rate of saturation with boron without changing the cryolite content of the paste was investigated. In view of the results

obtained the authors recommend a paste of composition 70% B₂C+26% Na₃AlF₆+4% NaF. (1 ref.)

63456 Corrosion resistance of deep drawing sheet steel. V.V. Ploshkin, P.G. Vaganov, A.M. Ryabyshv (Moscow Automobile Factory Tech. Coll., Moscow, USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.448-51 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.5-8 (July 1982). [received: March 1983]

The authors investigated the effect of several structural factors in low-alloy cold-rolled steels 20YuT and 08GSYuT and hot rolled steel 08Yu, with high-strength characteristics, on their corrosion resistance in 3% NaCl solution. The effect was also investigated of the rate of plastic deformation during stamping on the corrosion resistance of VAZ-2101 fenders made of cold-rolled steel 08Yu. (10 refs.)

63457 Effect of high-temperature vacuum annealing time on the structure and properties of titanium alloys. G.G. Maksimovich, Ya.I. Spektor, V.N. Fedirko, A.T. Pichugin, V.N. Moiseev.

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.455-9 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.11-14 (July 1982). [received: March 1983]

The microrelief and structure of the surface, the concentrations of alloying elements in the surface layer, its structure and microhardness, the hydrogen content in the bulk of the metal, and the strength and fatigue characteristics of the alloys, were investigated. (7 refs.)

63458 Effect of annealing on the structure and properties of molybdenum coatings on steel Kh12M. A.A. Andreev, L.V. Bulatova, G.N. Kartmazov, T.V. Kostritsa, A.A. Romanov.

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.481-4 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.31-2 (July 1982). [received: March 1983]

Molybdenum coatings obtained by the method of CIB (condensation from plasma phase upon arc atomisation in vacuum under ion bombardment conditions) on steel Kh12M, during the process of high-temperature annealing, became saturated with the carbon of the base, and the solid phase Mo₂C formed. In consequence of the opposite diffusion of carbon and molybdenum, a zone of increased hardness formed in the surface layer of the steel. The thickness of this zone depended on the annealing temperature. (4 refs.)

63459 Wear kinetics of a two-phase boride layer. E.V. Shadrachev, S.I. Rumyantsev (Northwest Correspondence Polytech. Inst., Leningrad, USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.495-8 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.40-2 (July 1982). [received: March 1983]

The minimum wear rate in an abrasive medium is found to be exhibited by a layer whose friction surface is a matrix of Fe₂B containing 10-30% of mono-boride FeB inclusions. For single-phase layers consisting of Fe₂B a higher (by a factor of 1.4 to 1.5) wear rate is typical. The wear rate of solid FeB layers is not less than the wear rate of Fe₂B layers although the hardness of Fe₂B is less than that of FeB. (10 refs.)

63460 Effect of vibroabrasive treatment on the fatigue strength of high-alloy steels. V.G. Osipenko, G.Ya. Shapovalova, P.P. Aulov (Voroshilovgrad Engng. Inst., Voroshilovgrad, USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.504-5 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.47-8 (July 1982). [received: March 1983]

A study was made of changes in surface layer condition under the action of chemically active solutions influencing article fatigue strength. The study was carried out on specimens made of steels 18Kh2N4MA and 18Kh2N4VA. (3 refs.)

63461 Fatigue strength of steel 45 with electrolytic iron coating, carbon nitrided with HF heating. V.I. Dobrya, I.V. Dushevskii, A.I. Murav'ev (Kishinev Agricultural Inst., Kishinev, USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.7-8, p.563-6 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.44-7 (Aug. 1982). [received: March 1983]

Carbon nitriding of electrolytic iron coating using heating by HF current increased the fatigue strength of restored parts made of steel 45 to 10-12%. The conditions of electrolytic deposition of iron coatings have a substantial effect on the productivity of the process and on the quality of the hardened layers. Electrolysis with AC with reverse pulse greatly increased the possibilities of using thermochemical treatment for restoring parts with iron coatings. The suggested method of hardening worn surfaces may be recommended for restoring to serviceability parts that in operation are subjected to cyclic loads. (7 refs.)

63462 Thermodynamics of homogeneous formation of cementite in austenite during case hardening of steel. V.M. Pereverzev, V.I. Kolmykov, I.N. Roslyakov.

Russ. Metall. (GB), no.6, p.59-62 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.61-4 (1981).

A thermodynamic analysis is given of the effects of manganese and chromium on the shape of the cementite which forms in the austenite matrix during case-hardening. Manganese does not intensify the thermodynamic stimulus to homogeneous formation of cementite in the carbon-saturated austenite, therefore it does not induce formation of granular cementite during case-hardening. Chromium (1.3 at.%) increases by several times the negative change in the free energy during homogeneous decomposition of the saturated austenite into an equilibrium austenite-cementite mixture, thus ensuring the possibility of formation of granular cementite in steel during case-hardening in the austenitic state. (7 refs.)

63463 Influence of silicon and boron on the high-temperature oxidation of nickel-chromium alloys. E.M. Lazarev, A.M. Samarin, N.A. Korotkov.

Russ. Metall. (GB), no.6, p.181-6 (1981). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.6, p.186-90 (1981).

Alloying with up to 2% Si increases appreciably the adhesion of the scale to the alloy but has little effect on its resistance to oxidation in air at 1000°C. A boron content above 0.2% induces increased crumbling of the scale and the scale resistance decreases sharply. The phase composition of the scale in the case of high boron contents is the same as for alloys without boron but the formation of an oxide with the boron, which evaporates easily at elevated temperatures, causes loosening (crumbling) of the scale and lowers its protective properties. (13 refs.)

63464 Diffusion modeling of the carburization process in stainless steels. D. Farkas (Dept. of Materials Engng., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).

Scr. Metall. (USA), vol.17, no.3, p.261-4 (March 1983). One of the features of the carburization process in stainless steels is that some of the alloying elements oxidize preferentially and depletion at the surface gives rise to a ternary cross diffusion effect that strongly changes the

shape of the carbon diffusion profile. Goldstein and Moren (see Met. Trans. A, vol.9, p.1515, 1978) developed a formalism to solve the ternary diffusion equation by the Crank-Nicholson finite difference method. The authors extend the solution to higher alloying element contents, in order to apply the results to carburization of stainless steels. (11 refs.)

63465 Influence of nitrogen on the penetration of hydrogen through constructional materials from nitrogen-hydrogen mixtures. V.I. Pokhmurskii, B.F. Kachmar, V.V. Fedorov (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.3, p.209-12 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.21-5 (May-June 1982). [received: Feb. 1983]

For the purpose of studying the features of combined interaction of hydrogen and nitrogen with constructional materials, investigations were made of the influence of additions of nitrogen on the hydrogen permeability (P) of EP-199 and VKh-4 and 12Kh18N10T steel. The investigation of the role of interstitial impurities in atomic ordering of the alloys showed that under the influence of hydrogen the critical temperatures of the phase transformations drop but in the presence of nitrogen they increase. The hydrogen penetrability of EP-199 and VKh-4 alloys and 12Kh18N10T steel decreases in nitrogen-hydrogen mixtures with an increase in nitrogen concentration, which is the result of the formation of nitride phases on the surface of the metal. (12 refs.)

63466 Fracture of metals under the action of hydrogen-containing media. A.L. Bichuya (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.3, p.213-16 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.26-30 (May-June 1982). [received: Feb. 1983]

The stress-rupture strength of BrKh-08 and EP-799 alloys and the short-time strength in vacuum, hydrogen, and ammonia of previously nitrated Armo iron were investigated to elucidate the mechanism of fracture of metals in hydrogen-containing media. It is noted that the appearance of the effect of hydrogen brittleness is in direct relationship to the catalytic activity of the metal. (21 refs.)

63467 Question of the safe boundaries of use of 12 MKh steel at increased temperatures and hydrogen pressures. Yu.I. Archakov, B.M. Teslya (All-Union Sci.-Res. Inst. for Petrochem. Processes, Leningrad, USSR).

Sov. Mater. Sci. (USA), vol.18, no.3, p.216-20 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.30-4 (May-June 1982). [received: Feb. 1983]

A study is presented of the rules of the hydrogen corrosion process and establishment of the safe boundaries of use of 12MKh steel in hydrogen. The tests were made under the all-sided and, to determine stress rupture strength, the one-sided pressure of gaseous hydrogen. The investigations made it possible to establish the differences in the change in mechanical properties, carbon content, and microstructure of 12MKh steel under the action of hydrogen with pressures of 4-100 MPa and temperatures of 450-600°C. Relationships of the time until the start of intense reduction in the ductility of the steel at various temperatures and pressures were found. An equation was set up for calculating the time until the start of hydrogen corrosion of the steel in relation to temperature and hydrogen pressure. The safe boundaries of the applicability of 12MKh steel at various temperatures and hydrogen pressures were determined. (15 refs.)

63468 High-temperatures reactions of metals with gases. II. Kinetics of growth of multiphase chemical compound layers at a metal/gas interface. V.I. Dybkov (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.8, p.640-6 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.47-54 (Aug. 1982). [received: Feb. 1983]

For pt. I see ibid., vol.21, no.7, p.52 (1982). The author considers the growth of layers of the chemical compounds M₂G₃ and M₂G₅ at the interface between the metal M and gas G. (7 refs.)

63469 Structural and morphological investigation of the oxidation of titanium diboride in various environments. II. Oxidation of titanium diboride in a steam-water environment. A.N. Pilyankevich, S.V. Papyan (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.21, no.8, p.655-7 (Aug. 1982). Translation of: *Poroshk. Metall. (USSR)*, vol.21, no.8, p.64-7 (Aug. 1982). [received: Feb. 1983]

It was observed that titanium diboride oxidizes in steam at temperatures not exceeding 100°C. Qualitatively, the degree of oxidation, which depends on its duration, can be determined only by electron microscopy and, less accurately, by the petrographic technique. Oxidation is more intense in boiling water than in steam. This may be a consequence of partial elution of the oxide film being formed and exposure of fresh surfaces to the oxidizing environment. Under these conditions, the oxidation reaction takes place at the titanium diboride oxidizing environment interface. (1 ref.)

63470 Nature of the carboxylate species incorporated in anodic alumina films formed in oxalic acid solution. Y. Yamamoto, N. Baba (Lab. of Electrochem. & Inorganic Chem., Tokyo Metropolitan Univ., Tokyo, Japan).

Thin Solid Films (Switzerland), vol.101, no.4, p.329-38 (25 March 1983). Electron spin resonance (ESR) and IR spectroscopy, combined with a chemical sectioning technique supported by transmission electron microscopy, were employed to study the nature of oxalate species incorporated into porous anodic films formed on aluminum in an aqueous solution of oxalic acid. ESR spectroscopy combined with chemical sectioning of the oxides indicated that spin centres, which are supposed to be due to the cleavage of the chemical bonds of oxalate species, are present predominantly in the outer region of the cell walls of the oxide. No spin centres, however, were detected in the inner region nearest to the cell boundary, although a small amount of carboxylate species was still detected in that region. In addition, IR spectroscopy of the oxide, chemically sectioned for various periods, showed that the incorporated species are present in the oxide as carboxylate ions but their structures showed marked variation as a function of depth from the surface of the cell wall of the oxide. These results suggest strongly that oxalate anions incorporated into a barrier layer of the oxide are unstable and undergo decomposition in the high electric field present within the layer during anodization. (28 refs.)

63471 Analysis of the corrosion products formed on Ti and a Ti-Pd alloy during exposure in hot water. I. Olefjord, H. Mattsson (Dept. of Engng. Metals, Chalmers Univ. of Technol., Goteborg, Sweden).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.669-78.

This is a preliminary report dealing with the surface analysis of reaction products formed on Ti and Ti-Pd alloy during their exposure in hot water. The compositions of the aqueous media were varied with respect to the dis-

solved oxygen and the content of chloride ions. The temperature was 60°C and the exposure times were 10 min and 6 months. Work is in progress in which samples are exposed at 80°C and 95°C in the aqueous solutions. Surface analysis was also performed on a sample which had been exposed in water-saturated bentonite. It appears from the ESCA spectra that the oxide products formed on the surface consist of TiO_2 . The results also indicate that the thickness of the film formed at 60°C in water is in the range 50 Å to 100 Å. This is somewhat more than that obtained after exposure in water at room temperature. Exposure for 6 months increases the thickness of the oxide two to three times compared to that obtained during the short exposure at 60°C. The analyses of the samples that had been embedded in bentonite indicate that the surface reaction products are thinner than those found on the surface after exposure in an open vessel. (9 refs.)

81.70 MATERIALS TESTING

(inc. sample preparation for examination, metallographic techniques, ion and electron microprobe techniques, Auger and photoelectron techniques, defectscopy; for measurement in the mechanics of solids and rheology, see 46.30R)

63472 The use of time-of-flight neutron diffraction to study grain interaction stresses. S.R.MacEwen, J.Faber, Jr., A.P.L.Turner (Materials Sci. Div., Argonne Nat. Lab., Argonne, IL, USA).

Acta Metall. (USA), vol.31, no.5, p.657-76 (May 1983). Time-of-flight neutron diffraction, using the General Purpose Powder Diffractometer at the IPNS (Intense Pulsed Neutron Source) at the Argonne National Laboratory, has been used to measure residual stresses in deformed, polycrystalline Zircaloy-2. It was found that a plastic tensile strain of 3% caused the (1010) and (1120) prism lines in the diffraction pattern to shift to higher d -spacings, while the (0002) basal line was shifted to a lower interplanar spacing. Compressive deformation reversed the direction of the shifts, with the prism and basal planes being left in residual compression and tension respectively. For the specimen deformed to 424 MPa in tension, the principal residual stresses after unloading were -188 MPa in the (c) direction and 173 MPa in the direction normal to the prism planes. The result is in good agreement with an analysis of the problem that considers an idealized texture that is representative of that found in Zircaloy-2 rod. The experiments demonstrate that time-of-flight neutron diffraction can be a sensitive and powerful tool for measuring residual stresses in bulk materials, where conventional X-ray techniques would be inapplicable. (48 refs.)

63473 Home resources serving to develop Auger and SIMS spectrometers for thin-film and surface analytical tests. G.Gergely. *Finnomech.-Mikrotech.* (Hungary), vol.22, no.2, p.60-3 (Feb. 1983). In Hungarian.

One of the tasks of the technology of material tests in the metal industry is the determination of the chemical composition of the surface and of its contaminations, as well as the composition-depth profiling of thin-films. Methods of surface and thin-film analytics mostly applied are Auger spectrometry (AES) and SIMS. With the use of a Riber OPC 103 CMA spectrometer and a QML 51 quadrupole mass-spectrometer the MTA MFKI developed, mainly based on home resources, its surface-analytical facilities. The author describes the UHV system operating in the 10^{-8} Pa pressure range (vacuum system, measuring chamber, manipulators) which has been developed in collaboration with Tungsram Research Institute. The bibliography offers a survey of the most important results obtained and of the material tests carried out with the devices. (14 refs.)

63474 Optical surface testing with diffused light. G.Thurn (Tech. Univ. Berlin, Berlin, Germany), T.Gast.

Feinwerktech. & Messtech. (Germany), vol.91, no.1, p.15-18 (Feb. 1983). In German.

Describes an optical measuring method for the testing of surfaces. A sensor detects the backscatter from rough surfaces with vertical illumination in a predetermined angle range. From the diffused light distribution, characteristics are evaluated with a microcomputer; these are used for the assessment of the quality and structure of the surfaces. Application possibilities for metallic materials are discussed. (15 refs.)

63475 Effect of specimen width on impact strength and location of brittle-ness temperature of St3ps steel. G.S.Schedrin (Technol. Inst. of Refrigeration Industry, Leningrad, USSR).

Ind. Lab. (USA), vol.48, no.6, p.605-6 (June 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.6, p.71-2 (June 1982). [received: March 1983]

The authors checked the effect of the specimen width on impact strength and position of critical brittleness temperature. It is found the use of sharp-notched specimens with any other than 10 mm width can produce marked changes in the impact strength and critical embrittlement temperature. (3 refs.)

63476 Plated weld mechanical characteristics. N.A.Makhutov, S.A.Ivanova (Blagovarov State Sci.-Res. Inst. of Machine Sci., Acad. of Sci., USSR). *Ind. Lab. (USA)*, vol.48, no.6, p.607-10 (June 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.6, p.73-5 (June 1982). [received: March 1983]

The authors' investigation of the strength of welded joints plated by the explosion method involved the determination of the local mechanical characteristics, since the presence of plating layers and the nonuniform hardening by impact waves resulted in a nonuniformity of properties over the weld thickness because individual zones of the joint hardened in different ways. The investigation was concerned with butt joints consisting of 20-mm thick St3ps steel plates plated on both sides by a 4-mm thick layer of Kh18Ni10T austenitic stainless steel. (4 refs.)

63477 Reliability of inspection of rolled steel for impact strength. M.I.Artem'ev, L.E.Valyaeva, F.D.Kamardina, N.E.Pakhomova (Magnitogorsk Mining-Metall. Inst., USSR).

Ind. Lab. (USA), vol.48, no.6, p.610-12 (June 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.6, p.75-6 (June 1982). [received: March 1983] (5 refs.)

63478 Influence of the type of stress state on the nature of acoustic-emission signals. A.V.Skoblo, A.P.Zhigun, S.A.Kolesov, L.P.Dunina (Gorki Automobile Plant, Gorki, USSR).

Ind. Lab. (USA), vol.48, no.6, p.625-7 (June 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.6, p.91-2 (June 1982). [received: March 1983]

The authors present the results of an analysis of acoustic-emission signals produced in samples of steel 30KhGSA (quenched from 880°C in oil, tempered at 210 and 570°C) subjected to various types of loading. (4 refs.)

63479 Accelerated determination of the stress-rupture strength of low alloy tubing steel. A.D.Kovaleva, S.R.Kudashevich (Nikopol South Tube Plant, USSR).

Ind. Lab. (USA), vol.48, no.6, p.627-9 (June 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.6, p.93-4 (June 1982). [received: March 1983]

Samples from 273×32 mm 12Kh1MF steel tubing were tested. The base was the standard test method. The characteristics of high temperature strength were determined at operating temperatures of 813 and 843K and also at the higher temperatures of 873 and 903K. The tests were made at three stresses for each temperature. The values of stress-rupture strength were determined by constructing the appropriate log-log curve to log σ vs. log T coordinates and by the method of orthogonal regression or of average least squares, the basis of which is the equation of the stress-rupture strength curve. Also investigated was the method of accelerated testing proposed by V.I. Nikitin (1959) and based on the use of the Larsen-Miller parameter. (1 ref.)

63480 A technique for observing the cross sectional damage profiles in He-ion irradiated 316 stainless steel by transmission electron microscopy. S.Hamada, M.Tanaka, K.Shiraishi (Div. of Nuclear Fuel Res., JAERI, Ibaraki, Japan).

J. Nucl. Mater. (Netherlands), vol.114, no.2-3, p.338-40 (Feb. 1983).

The technique described is a modification of the technique to observe the depth distribution of damage produced in the stainless steel without heat treatment after ion irradiation. The depth distributions of defect clusters created by atomic displacement and injected helium were observed separately in a He-irradiated type 316 stainless steel specimen by using this technique. (13 refs.)

63481 The connection of hardness indentation processes with the flow curve of metallic material. R.Boklen.

Mater. Test. (Germany), vol.25, no.4, p.117-19 (April 1983). In German.

10 steels and 10 nonferrous metal test pieces were examined after indentation axially with three differently shaped indenters and with 100° diamond cone indenter. The latter was found particularly suitable. Deviations from Hooke's law became first apparent between 80 and 90 N. There was a connection between indentation and flow curve which allowed for the calculation of tensile strength for 24 nonferrous metals and 18 steels with a scatter of ± 0.025 . (14 refs.) /R.S.

63482 Microdeformation machine for testing thin films with automatic tension-diagram recording. M.E.Scherbina, V.N.Zaruba.

Meas. Tech. (USA), vol.25, no.8, p.676-7 (Aug. 1982). Translation of: *Izmer. Tekh. (USSR)*, vol.25, no.8, p.44-5 (Aug. 1982). [received: April 1983]

Describes a microdeformation machine for examining the mechanical properties of thin films with automatic recording of the strain curve by active strain and also by creep methods. The design eliminates the effects of outside forces on the strain. The machine consists of a massive baseplate, on which are mounted the strain device and the support with an immobile clamp. The strain device includes a stand forming the parallelogram along with a plate which bear the mobile jaw on wires. During the deformation, the film is acted on by the resultant force and also the bending force arising from the motion of the jaw around the circle. The strain is determined by means of photoelectric transducers and recorded automatically by a ODS-021 XY-recorder. (2 refs.)

63483 Metallographic signs of forging overheating in 11Kh4F3S2V2M die steel. A.S.Muzheva, N.A.Makalkova, T.E.Marder (Kamaz Truck Plant, USSR).

Met. Sci. & Heat Treat. (USA), vol.24, no.5-6, p.405-8 (June 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.6, p.26-8 (June 1982). [received: Feb. 1983]

An investigation was made of the influence of the original condition on the macro- and microstructure and the structure of the fractures of 11Kh4F3S2V2M steel after heat treatment. Signs of forging overheating in 11Kh4F3S2V2M are revealed in three conditions: in the original in the form of a structure of oriented fine granular pearlite (actually no.7-9 austenitic

grain size); in the hardened in the form of variation in grain size after austenitizing at the optimum temperatures (from no.12 to no.8 austenitic grain size); after final tempering in the form of facets of naphthalenelike fracture on a general background of a fine-grained fracture. In the fractures of samples after final heat treatment, traces of forging overheating appear in the form of area of fracture along martensite plates. In 11Kh4F3S2V2M steel hardened from a reduced (1060°C) temperature traces of forging overheating are revealed only by electron fractography (the presence of areas of fracture in martensite). (4 refs.)

63484 Specimens and apparatus for the magnetoluminescent quality control of components. P.F.Gritskov (Kamaz Truck Plant, USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.5-6, p.409-10 (June 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.6, p.29 (June 1982). [received: Feb. 1983]

In evaluating the qualitative characteristics of powders and suspensions, the resolving power of magnetic powders, and their photocolouristic properties, and the extent to which the suspensions are contaminated by luminescent particles and to determine the concentration of the magnetoluminescent powder, developed and built a model in the Nondestructive Control Methods Laboratory at the Kamaz Truck Plant. (no refs.)

63485 Structure of titanium alloys and methods used for its control. G.V.Shakhonova, M.Ya.Brun (All-Union Inst. of Light Alloys, USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.7-8, p.547-53 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.7, p.19-22 (July 1982). [received: March 1983]

A method is proposed for point rating of the structure of titanium ($\alpha+\beta$) alloys which places no restrictions on the varieties of structure that can be monitored. The quantitative principle, on the basis of which the structure is divided into points, renders this method objective and well-defined. (2 refs.)

63486 Acoustic emission during phase transformations in alloys. B.I.Voronenko (Gor'kii Res. Physicotech. Inst., Gor'kii, USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.7-8, p.584 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.30-6 (Aug. 1982). [received: March 1983]

The phenomenon of acoustic emission can be used in studying the characteristic features of the mechanism, kinetics, and energy parameters of the martensitic transformations: determination of the martensite points and the amount of martensite that is formed, measurement of the rate of initiation and growth of martensite crystals, investigation of preliminary processes, establishment of the incubation period and the early stages of the formation of martensite, determination of the type of kinetics, structural mechanism, and morphology of the martensite that is formed, and the formation and annihilation of transformation twins, and determination of the degree of cooperativeness of the transformation, the presence and degree of the autocatalysis effect, and the heterogeneity of the shear strain during the transformation. (94 refs.)

63487 Device for fashioning a U-shaped notch in impact specimens. A.K.Shubina, A.F.Kozyrev (Kama Truck Plant, USSR). *Met. Sci. & Heat Treat. (USA)*, vol.24, no.7-8, p.584 (July-Aug. 1982). Translation of: *Metalloved. & Term. Obrab. Met. (USSR)*, vol.24, no.8, p.60-1 (Aug. 1982). [received: March 1983]

A device for the simultaneous fabrication of three type-I specimens or six type-III specimens with an identical notch is proposed. The material used to fabricate the specimens is steel with a hardness to HRC 40. The device is a II-shaped frame, in the channel of which specimens are placed. In both walls of the frame, there is a through hole 2 mm in diameter of a depth of 9 mm, which makes it possible to notch all the specimens simultaneously. (no refs.)

63488 Fundamentals of the surface-analytical methods AES/SAM, ESCA (XPS), SIMS, and ISS in comparison with X-ray microanalysis and their application for material testing. H.Hantsche (Bundesanstalt für Materialprüfung, Berlin, Germany).

Microsc. Acta (Germany), vol.87, no.2, p.97-128 (March 1983). In German. After describing the fundamental physical principles of excitation and emission of particles in the atom, the main differences of the four methods and their information content are discussed. The experimental technique is explained and some applications for characterization of interesting technical materials are shown: a depth profile of a TiN-layer on steel; a SIMS-spectrum of a boron treated chromium steel; ISS-spectra of the first one to three atomic layers of glass; Auger elemental distribution images of some light elements (spot welding electrodes); XPS-spectra of chromium metal and chromium oxide Cr₂O₃; grain boundary segregations on a metallic fracture surface. (45 refs.)

63489 Acoustic emission monitoring. D.Jaffrey (Dept. of Metall. & Mining, Royal Melbourne Inst. of Technol., Melbourne, Victoria, Australia). *Met. Forum (Australia)*, vol.5, no.3, p.154-7 (Winter 1982). The history of acoustic emission is discussed in relation to its limitations and applications. The current research and laboratory work on detection of martensite plates, deformation twins, slip bands, hydrogen cracking, and SCC is considered in relation to metals, ceramics, refractories, glasses, composite materials and rocks. (9 refs.)

63490 The significance of acoustic emission activity in stress-corrosion testing. W.J.Pollock (Aeronautical Res. Labs., Dept. of Defence Support, Melbourne, Victoria, Australia), D.Hardie. *Met. Forum (Australia)*, vol.5, no.3, p.186-91 (Winter 1982). Acoustic emission activity is proposed as a basis for determining the suitability of acoustic emission for monitoring stress-corrosion cracking. The practical and mechanistic implications of this concept are discussed with particular reference to acoustic emission ring-down count and amplitude analysis techniques. (17 refs.)

63491 Tests on quality of adhesion of polymers to metal surfaces. I. Theoretical and experimental principles—state and limits of testing techniques. C.Bischof, A.Bauer, H.W.Leonhardt. *Plaste & Kautsch. (Germany)*, vol.30, no.1, p.1-5 (Jan. 1983). In German. The basic theories relating to adhesion of polymers to metal surfaces, i.e. polarisation, diffusion, electrostatic attraction, thermodynamic forces, etc. are mentioned and it is concluded that since adhesion is a very complex phenomenon, no satisfactory quantitative test for it is at present available. The factors which exert the main influence on adhesion are described. At present destructive tests are still predominant. A systematic test procedure is listed consisting mainly of physical tests such as torsion, compression, ultrasonic vibration, centrifuging, etc. and comments on these tests are given. So far no one reliable method is in existence allowing a quantitative assessment of adhesion of polymers to metal surfaces to be made. (72 refs.) G.R.S.

63492 A penetration test for granular materials using various tip angles and penetrometer shapes. M.Yamashiro, Y.Yuasa (Dept. of Planning Technol., Ashikaga Inst. of Technol., Ashikaga, Japan). *Powder Technol. (Switzerland)*, vol.34, no.1, p.99-103 (Jan.-Feb. 1983).

The relationships between the penetrated depth and the load are investigated with various conical vertex angles and diameters of the penetrating bar by using glass beads and Toporex (trade name of styrol resin). (4 refs.)

63493 Question of determining the electrochemical condition in a developing crack in investigating the crack resistance in a corrosive medium. V.V.Panasyuk, L.V.Ratysh, I.H.Dmytrakh (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.3, p.228-33 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.42-9 (May-June 1982). [received: Feb. 1983]

A new method is presented of determining the pH and the electrode potential ϕ at the tip of a developing crack during crack resistance tests in aqueous media with the use of which investigations were made of the rules of change in the electrochemical condition at the tip, and a study was made of its influence on fatigue crack growth rate in 40Kh13 steel in a working medium with a pH of. (16 refs.)

63494 A method of predicting the life of protective coatings. V.I.Nikitin (I.I. Polzunov Central Sci. Res. & Design Boiler & Turbine Inst., Leningrad, USSR).

Sov. Mater. Sci. (USA), vol.18, no.3, p.273-7 (May-June 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.3, p.95-9 (May-June 1982). [received: Feb. 1983]

A basic problem in investigating the properties of protective coatings is evaluating their life under service conditions. The author proposes, first, determination of the effectiveness of the protective influence of coatings in corrosion tests and, second, the development of a method of predicting the service life of coatings under the operating conditions of machine parts based on the results of comparative short-time experiments. A variation of solution of this problem applicable to high-temperature sulfide oxide corrosion of protective coatings of gas-turbine blades is presented for the life of Co-Cu-Fe-ZrO₂ coatings on Zh56K alloy. (10 refs.)

63495 Electron microscopic observation of hard material using an ion sputtering technique. A.Doï (Itami Res. & Dev. Dept., Sumitomo Electric Industries Ltd., Osaka, Japan), H.Shima, S.Harada, T.Nishikawa. *Sumitomo Electr. Tech. Rev. (Japan)*, no.22, p.203-12 (Jan. 1983).

Describes a technique which has been introduced to prepare thin foil specimens of hard material for TEM observation with the aid of ion beam sputtering in which the atoms in the surface of the specimen are sputtered by an illuminating beam to the ionized material. The authors introduce an ion sputtering technique to prepare thin foil specimens of various ceramics and cemented carbides, make TEM observations using specimens thus prepared, and conduct elementary analysis of extremely localized areas with an energy dispersive X-ray spectroscopy that was attached to the TEM. By means of selective etching by ion beam sputtering, observation of microstructures that are otherwise difficult by means of chemical etching or other processes becomes possible. Results of observations of sintered microstructure using this technique are also given. (4 refs.)

63496 Ultimate tensile measurements of filled gelatin gels. S.B.Ross-Murphy, S.Todd (Colworth Lab., Unilever Res., Sharnbrook, England). *Polymer (GB)*, vol.24, no.4, p.481-6 (April 1983).

Ultimate tensile measurements were performed on the model system of glass filled gelatin gels. By using a range of sizes of glass ballotin, and also shape sorted fragments of fractured ballotin (denoted 'cubes') at varying phase volume of filler, the effect of size, shape and phase volume on the ultimate tensile properties of the filled gel samples was investigated. By constructing a force-extension failure envelope, a relationship was developed which enabled all the fracture data for the samples to be simply related, and this empirical relation was within experimental error identical to previously derived theoretical treatments of the dependence of small deformation modulus on phase volume. (17 refs.)

82.20 CHEMICAL KINETICS

63497 The reactive quantum Boltzmann equations: a derivation from an arrangement channel space representation and BBGKY hierarchy. J.W.Evans, D.K.Hoffman (Dept. of Chem., Iowa State Univ., Ames, IA, USA), D.J.Kouri.

J. Chem. Phys. (USA), vol.78, no.5, p.2665-81 (1 March 1983).

A rigorous derivation of the reactive quantum Boltzmann equations is presented for systems where breakup and combination are excluded. The use of an arrangement channel space representation allows an exact decomposition of the N particle density matrix into components for different chemical compositions and an exact definition of reduced species density matrices (as opposed, e.g. to standard projection operator techniques). This necessitates the use of the combinatorially complex arrangement channel BBGKY hierarchy which, however, avoids the need for the usual heuristic specification of collision terms. Another advantage is that scattering equations generated for the reactive and nonreactive many body T matrices appearing in the Boltzmann equations have 'well-behaved' kernels (unlike the corresponding Lippmann-Schwinger equations). From the derived equations the authors readily obtain, e.g. reaction-diffusion equations and nonequilibrium expressions for the chemical reaction rates. (64 refs.)

63498 Analysis of periodic perturbations of limit cycles. P.Rehms, J.Ross (Dept. of Chem., Stanford Univ., Stanford, CA, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3747-55 (15 March 1983).

An algorithm due to Loud (1961) is used to find asymptotically convergent series solutions for limit cycles subjected to weak periodic perturbations. If an exact or approximate solution to the unperturbed limit cycle is available near or far from marginal stability, then accurate predictions can be made for entrainment bands and the phase relationships between the various oscillatory chemical species and the perturbation. The utility of this method is shown for several model systems. In an appendix, the appearance and character of critical slowing down at the edges of entrainment bands is demonstrated. (47 refs.)

63499 On the theory of kinetic isotope effects in proton transfer reactions. Influence of the anharmonicity of proton potentials. J.Suhnel, K.Gustav (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany).

Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.31, no.6, p.113-18 (1982). In German.

The influence of the anharmonicity of the proton potential on the kinetic isotope effect (KIE) in proton-transfer reactions is investigated within the framework of the quantum-statistical mechanical theory of rate processes. The dependence of the KIE on the shape of the interaction potential between the reactants is analogous from a qualitative point of view both for harmonic and anharmonic proton potentials. For realistic interaction potentials an increase of the KIE up to 15% is found if anharmonicity is taken into account. (10 refs.)

63500 Chiral symmetry breaking in nonequilibrium systems. D.Kondepudi, G.W.Nelson (Center for Studies in Statistical Mech., Univ. of Texas., Austin, TX, USA).

Phys. Rev. Lett. (USA), vol.50, no.14, p.1023-6 (4 April 1983).

Sensitivity of a nonequilibrium chemical system to small symmetry-breaking influences is analyzed in the context of chiral-symmetry breaking. For a hypothetical model system, with realistic kinetic constants, a reaction energy barrier difference of $\Delta E/kT=10^{-17}-10^{-15}$ is shown to be sufficient to have a strong chiral selectivity. This is in the range of the estimated energy differences between right- and left-handed molecules due to weak neutral currents. (19 refs.)

63501 Measurements of collisional energy transfer in unimolecular processes. R.G.Gilbert (Dept. of Theoretical Chem., Univ. of Sydney, Sydney, NSW, Australia).

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.259-62 (1 April 1983).

It is shown that the optimal means of tabulating collisional energy transfer parameters in gas-phase uni- and ter-molecular reactions is as the average downward energy transfer, rather than the total energy transferred or the collision efficiency. (10 refs.)

82.30 SPECIFIC CHEMICAL REACTIONS; REACTION MECHANISMS

63502 Alkali-halide association and dissociation rates in an ambient gas. D.R.Bates (Harvard-Smithsonian Center for Astrophys., Harvard Univ., Cambridge, MA, USA).

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.4-8 (25 March 1983).

Calculations are carried out on the rate coefficients for the association of alkali and halogen atoms in an ambient gas. Because of curve crossing the rate coefficients can be quite high. Curve crossing will facilitate other association processes. Reciprocal lifetime of alkali halides towards collisional dissociation into atoms and into ions are also evaluated. (16 refs.)

63503 A new method for the measurement of vibrational-state-selected ion-molecule reactions at thermal energies. D.van Pijkeren, J.van Eck, A.Niehaus (Fysisch Lab., Rijksuniv. Utrecht, Utrecht, Netherlands).

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.20-3 (25 March 1983).

A photoelectron-secondary-ion-coincidence method is described that allows the authors to determine the relative vibrational-energy-dependent cross sections for reactions of molecular ions with neutral atoms or molecules at thermal energies. Results for reactions of $H_2^+(\nu)$ in vibrational states $\nu=0-8$ with $H_2(H_3^+)$, $Ne(NeH^+)$ and $He(HeH^+)$ are reported. (8 refs.)

63504 A quantitative interpretation of the magnetic field effect on hyperfine-coupling-induced triplet formation from radical ion pairs. A.Weller, F.Nolling, H.Staerk (Abteilung Spektroskopie, Max-Planck-Inst. fur Biophys. Chem., Göttingen, Germany).

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.24-7 (25 March 1983).

Experimental determined $B_{1/2}$ values characterizing the magnetic field dependence of molecular triplet production from radical ion pairs originating from photoinduced electron transfer are compared with semi-empirical values obtained according to $B_{1/2}(hf)=2(B_1^2+B_2^2)/(B_1+B_2)$ from the root-mean-square values for the hyperfine coupling of the two radicals, B_1 and B_2 . The very good agreement is discussed. (8 refs.)

63505 The exciplexes of thiindigo with duren and hexamethylbenzene and their influence on photoisomerization. E.Birckner, R.Paetzold (Sektion Chem., Friedrich-Schiller Univ., Jena, Germany), M.V.Kozmenko, M.G.Kuz'min.

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.38-42 (25 March 1983).

The quenching of thiindigo fluorescence by hexamethylbenzene and duren in solvents of low polarity is accompanied by exciplex emission. The exciplex formation and dissociation rate constants and its photophysical properties are determined. Thiindigo photoisomerization can proceed via exciplex formation. (11 refs.)

63506 Radiofrequency labelling of molecules in chemical reactions. R.Z.Sagdeev, T.V.Leshina, N.E.Polyakov, V.I.Maryasova, A.Y.Yurkovskaya, A.A.Obnynochy (Inst. of Chem. Kinetics & Combustion, Acad. of Sci., Novosibirsk, USSR).

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.108-13 (25 March 1983).

A method of radiofrequency labelling of molecules in chemical reactions has been proposed. It is based on selective RF pumping of molecules and on tracing the transformation of this label in the reaction products by the NMR spectra. Applications of this method in studying one-way reaction mechanisms are illustrated by some experimental examples. (9 refs.)

63507 Vibrational analysis of the products from thermal decomposition of OCS and CO_2 . J.A.Chenery, A.Fakhr, M.I.Wood, C.J.S.M.Simpson (Phys. Chem. Lab., Univ. of Oxford, Oxford, England).

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.143-7 (1 April 1983).

The thermal decomposition of CO_2 and OCS has been studied using a shock tube and CW CO probe laser. The energies of activation are in good agreement with the values of other workers. It has been shown that the CO formed from OCS has an initial nonthermal vibrational distribution with a large excess in $\nu=0$. (14 refs.)

63508 Laser photolysis/laser-induced fluorescence study of the reaction of hydroxyl radical with ethylene. F.P.Tully (Sandia Nat. Labs., Livermore, CA, USA).

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.148-53 (1 April 1983).

A new, laser-based chemical kinetics technique has been demonstrated in studies of the reaction of OH with C_2H_4 . The reaction mechanism is dominated by electrophilic addition of OH to the double bond at low temperatures, and by increasingly rapid decomposition of the thermalized adduct HO_2H_4 back to reactants as the temperature is raised. (29 refs.)

63509 Production of vibrationally excited OH in chemiluminescent reactions of ozone with monoterpenes. P.K.Arora, K.G.Vohra (Air Monitoring Section, Bhabha Atomic Res. Centre, Bombay, India).

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.161-6 (1 April 1983).

Emission from vibrationally excited OH molecules (Meinel bands) has been observed in chemiluminescent gas-phase reactions of ozone with myrcene, α -phellandrene, α -pinene, limonene and linalol. In addition emission from $HCHO(A_2)$ and methylglyoxal (A_1) has also been identified in reactions with myrcene, α -pinene and α -phellandrene. (10 refs.)

63510 The H_2 elimination reactions of $\dot{A}^+B_3C_2H_4^+$ and $C_2D_4^+$. P.D.Lightfoot, C.J.Danby, I.Powis (Phys. Chem. Lab., Oxford Univ., Oxford, England).

Chem. Phys. Lett. (Netherlands), vol.96, no.2, p.232-6 (1 April 1983).

Kinetic energy releases from the unimolecular H_2 (D_2) elimination reactions of energy-selected $\dot{A}^+B_3C_2H_4^+$ ($C_2D_4^+$) have been obtained by a photoelectron-photoion coincidence technique. The energy releases suggest a 1,1 elimination and are compatible with the presence of a small reverse activation energy barrier of the order of 0.02 eV. Such a barrier was indicated by a

detailed ab initio study of this dissociation and the present results are discussed in the light of this theoretical treatment. (10 refs.)

63511 Localized MO analysis of the 1,2-hydrogen shift mechanism. Tae-Kyu Ha (Lab. of Phys. Chem., Swiss Federal Inst. of Technol., Zurich, Switzerland), Minh-Tho Nguyen, M.Hendrickx, L.G.Vanquickenborne. *Chem. Phys. Lett. (Netherlands)*, vol.96, no.3, p.267-72 (8 April 1983).

For the 1,2-hydrogen shift, a localized SCF MO analysis shows that two different electronic rearrangement mechanisms are possible. In the first case, the migrating hydrogen behaves as a hydride along the entire reaction path; in the other case, the migrating hydrogen behaves as a hydride, but in the second half of the reaction behaves as a naked proton. The difference between two mechanisms appears to be related to the spatial orientation of the lone-pair orbitals. (16 refs.)

63512 Quantum-mechanical differential reaction cross sections for the $F+H_2(\nu=0) \rightarrow FH(\nu=2,3)+H$ reaction. R.E.Wyatt (Dept. of Chem., Univ. of Texas, Austin, TX, USA), M.J.Redmon. *Chem. Phys. Lett. (Netherlands)*, vol.96, no.3, p.284-8 (8 April 1983).

Velocity-scattering angle intensity maps for the $F+H_2(\nu=0; j=0) \rightarrow FH(\nu=2,3; j') + H$ reaction are predicted from quantum-mechanical J_z -conserving calculations. The extent of the shift in the angular distribution from backscattering at 1.8 kcal/mole to sideways scattering (intensity peak at 100°) at 3.0 kcal/mole is in quantitative agreement with recent crossed molecular beam experiments. (20 refs.)

63513 Cerium-induced excitability and nonperiodic behaviour in closed Belousov-Zhabotinsky systems. P.Ruoff (Dept. of Chem., Univ. of Oslo, Oslo, Norway).

Chem. Phys. Lett. (Netherlands), vol.96, no.3, p.374-8 (8 April 1983). In closed stirred Belousov-Zhabotinsky reactions high initial Ce(IV) concentrations lead to an excitable steady state situated between two oscillating domains. At intermediate Ce(IV) concentrations irregular oscillations and bursts are observed. In unstirred excitable media Ce(IV) waves are observed. (23 refs.)

63514 Vibrational energy disposal in reactions of fluorine atoms with hydrides of groups III, IV and V. A.S.Manocha, D.W.Setser, M.A.Wickramaratne (Dept. of Chem., Kansas State Univ., Manhattan, KS, USA).

Chem. Phys. (Netherlands), vol.76, no.1, p.129-46 (1 April 1983). The HF infrared chemiluminescence from the reactions of F atoms with BH_3 , CH_4 , CH_3F , CH_2F_2 , CH_2Cl_2 , CH_3ONO , CH_3NO_2 , NH_3 (and ND_3), PH_3 and $HNCO$ has been observed from a 300K flowing-afterglow reactor. Experiments were done for a range of CH_4 and F atom concentrations to identify conditions which were free of vibrational relaxation and secondary reactions, and these conditions were used to assign initial $HF(\nu)$ vibrational distributions for each reaction. The emission intensity from each reaction also was compared to that from CH_4 in order to obtain the relative HF formation rate constants at 300K. Since the absolute rate constant for $F+CH_4$ is well established, the combination of all of these data provides absolute rate constants for $HF(\nu)$ formation at 300K. The ND_3 reaction was studied to obtain information on more vibrational levels in order to better estimate the $HF(\nu=0)$ and $DF(\nu=0)$ components of the ammonia distributions. With NH_3 and ND_3 there is no significant isotope effect on the energy disposal. Except for $NHCO$, for which an addition-elimination channel is possible, the $HF(\nu)$ distributions are inverted and $\langle f_{\nu} \rangle \approx 0.60$. Differences between the $HF(\nu)$ distributions reported here and some other reports in the literature are noted; the present data are discussed as representative of direct H atom abstraction for 300K Boltzmann conditions. The HCl infrared chemiluminescence from the $F+CHCl_2$ secondary reaction also was observed; the $HCl(\nu)$ distribution was $\nu_1, \nu_2, \nu_3, \nu_4, \nu_5 = 0.47:0.23:0.18:0.08:0.04$. (57 refs.)

63515 C_{2v} insertion pathway for BeH_2 : a test problem for the coupled-cluster single and double excitation model. G.D.Purvis (Dept. of Chem., Univ. of Florida, Gainesville, FL, USA), R.Shepard, F.B.Brown, R.J.Bartlett. *Int. J. Quantum Chem. (USA)*, vol.23, no.3, p.835-45 (March 1983).

(Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982). The coupled-cluster single and double excitation model (CCSD) is applied to an energy path for the insertion of Be into H_2 and compared to the full configuration interaction (FCI) and full valence-multiconfiguration self-consistent field (FV-MCSCF) results. This model problem is a severe test of a single-reference-function correlated method since two configurations are heavily weighted in the FCI description. CCSD is demonstrated to describe the FCI results using a single reference function which, however, changes orbital characteristics along the sampling path. In this case CCSD gives excellent agreement with the FCI results. (34 refs.)

63516 Contracted CI calculations of models for catalytic reactions involving transition metals. M.Blomberg, U.Brandemark, L.Petterson, P.Siegbahn (Inst. of Theoretical Phys., Univ. of Stockholm, Stockholm, Sweden).

Int. J. Quantum Chem. (USA), vol.23, no.3, p.855-63 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982). Theoretical models for reductive elimination from transition metal containing molecules have been studied using large scale contracted CI calculations. Four different models were treated, namely, NiH_2 , PdH_2 , $Ni(CH_3)_2$, and $Pd(H_2O)_2H_2$ in order to study the effects of adding ligands, exchanging hydrogens with methyl groups, and comparing nickel and palladium. The most interesting result already appeared for the simplest system NiH_2 . A closed-shell-type A_1 state with a small bond angle of only 57° is bound compared to Ni and H_2 with only a very small barrier for formation. The bond distance is short, shorter than in NiH , and the d orbitals are strongly involved in the binding. The hydrogen atoms bind both to nickel and to each other. With methyl groups rather than hydrogens, this double sided bonding situation is destroyed and $Ni(CH_3)_2$ has a negative binding energy with the carbon bonds pointing towards nickel. For PdH_2 only a weakly bound complex between an essentially unchanged H_2 and Pd was found. The bond distance is very long. Adding H_2O ligands to Pd shortens the bond distance and significantly opens up the bond angle. The methods used in the investigation and the chemical implications of the results are discussed. (21 refs.)

63517 Single versus double insertion in a simple intermolecular carbene reaction. K.Jug, P.C.Mishra (Theoretische Chemie, Univ. Hannover, Hannover, Germany).

Int. J. Quantum Chem. (USA), vol.23, no.3, p.887-90 (March 1983). (Proceedings of the Fourth International Congress in Quantum Chemistry, Uppsala, Sweden, 13-20 June 1982).

The carbene reaction $^1CH_2+C_2H_6$ was studied with the semiempirical method SINDO1. The pertinent transition states and products were obtained by geometry optimization on a CI surface. The authors find the insertion reaction forming C_3H_8 greatly favored compared to the double insertion leading to $CH_4+C_2H_4$. The result is qualitatively the same for the reaction of the two possible intermediate radicals CH_3 and C_2H_5 . The geometries and energies of all transition states are presented. (9 refs.)

63518 Dissociation of liquid arsenic selenoiodide. Le Kong Hoai, B.G.Bakhyshov, S.M.Gadzhiev, I.S.Sattar-zade (S.M. Kirov State Univ., Azerbaizhan SSR).

Inorg. Mater. (USA), vol.18, no.5, p.664-6 (May 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.5, p.789-91 (May 1982). [received: Feb. 1983]

The thermal dissociation of liquid arsenic selenoiodide was studied, and the composition of the liquid phase and the constant and rate of dissociation of AsSel were calculated. The temperature region of stability of AsSel was determined. The dependence $\log K=f(1/T)$ of the dissociation of liquid arsenic selenoiodide was determined. ΔH_T and ΔS_T of the dissociation of AsSel in the liquid phase were calculated. (6 refs.)

63519 π complexing of chlorine atoms: is that all there is? P.S.Skell, H.N.Baxter, III, C.K.Taylor (Dept. of Chem., Pennsylvania State Univ., University Park, PA, USA).

J. Am. Chem. Soc. (USA), vol.105, no.1, p.120-1 (12 Jan. 1983).

With low concentration of substrates the H-abstracting species would live longer before encountering a substrate molecule. The π -complex rationalization would predict no change in selectivity with decreasing concentration of substrate, only, perhaps, a decrease in yield of chlorinated substrate. The authors report that a very marked increase of selectivity occurs with progressive diminution of the substrate concentration. (5 refs.)

63520 Diffusion controlled processes among stationary reactive sinks: effective medium approach. R.I.Cukier (Dept. of Chem., Michigan State Univ., East Lansing, MI, USA), K.F.Freed.

J. Chem. Phys. (USA), vol.78, no.5, p.2573-8 (1 March 1983).

Formulates an effective medium theory for diffusion controlled processes among randomly distributed, stationary, reactive sinks. An implicit expression for the exact 'self-energy' of the combined reactive density field and sinks is obtained in terms of the exact medium propagator. The lowest order truncation of this expression can be solved by numerical iteration for the self-energy. The rate and diffusion coefficients as a function of sink concentration extracted from this self-energy. The authors also consider the next order truncation which explicitly introduces the pair correlation function of the sinks. (9 refs.)

63521 Selective vibrational excitation of the ethylene-fluorine reaction in a nitrogen matrix. L.H.Frei, G.C.Pimental (Chem. Dept., Univ. of California, Berkeley, CA, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3698-712 (15 March 1983).

Selective vibrational excitation of the cryogenic reactions between fluorine and C_2H_4 , CH_2CD_2 , trans-CHDCHD, and cis-CHDCHD have been studied in solid nitrogen at 12K. For the C_2H_4, F_2 reaction, quantum yields showed a general increase over five orders of magnitude as photon energy increased; ν (cm^{-1}), ϕ , 953, $<3 \times 10^{-8}$, 1896, 6.6×10^{-4} , 2989, 2.3×10^{-2} ; 3076, 7.0×10^{-2} , 3105, 4.3×10^{-2} , 4209, 3.1×10^{-1} . Deviations from this general trend give evidence of mode selectivity. Similar deviations indicative of mode selectivity are found for trans-CHDCHD. At comparable photon energy, the quantum yields of the diderethylenes decrease markedly in the sequence $\phi(r\text{-CHDCHD}) > \phi(c\text{-CHDCHD}) \approx \phi(CH_2CD_2)$. These differences are attributable to a g, u selection rule in the phonon-relaxation mechanism. All of the results are consistent with a competition between chemical reaction of the vibrationally excited ethylene and phonon-assisted relaxation. The resulting cascading process accounts for the general rise in ϕ as ν increases and deviations from this general rise are attributable, at least in part, to mode selectivity. (21 refs.)

63522 Kinetics of the Cl- H_2 system. II. Abstraction vs exchange in $D+HCl$. J.C.Miller, R.J.Gordon (Dept. of Chem., Univ. of Illinois, Chicago, IL, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3713-20 (15 March 1983).

For pt.1 see *ibid.*, vol.75, no.11, p.5305-10 (1981). The gas phase reaction of D with HCl was studied at room temperature by the method of flash photolysis, with resonance fluorescence detection of D, H, and Cl atoms. The D and Cl atoms were observed to decay exponentially, whereas no H atom signal from the exchange reaction was detectable. From the calibrated sensitivity of the H atom detector, an upper limit of 0.002 was set for the ratio of rate constants for the exchange vs abstraction channels. (58 refs.)

63523 A shock tube study of DF dissociation. J.F.Bott, N.Cohen (Aerophys. Lab., Aerospace Corp., Los Angeles, CA, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3721-6 (15 March 1983).

The dissociation rate for DF in argon has been studied with shock tube experiments at temperatures between 3600 and 7200K. The data were best fitted by the rate coefficient equation $k_1 = 2.7 \times 10^{22} T^{-2} \exp(-137130/RT)$ $cm^3/mol \cdot s$. A few experiments performed at $\sim 5000K$ indicated that DF dissociates more rapidly in a helium bath than in argon by a factor of 2.9-4.1. A comparison of recombination rate coefficients for several hydrogen halides at 4000K reveals only small deviations from a value of $10^{14.4} cm^3/mol \cdot s$. (19 refs.)

63524 Reactive and inelastic processes involving $I_2(D^1\Sigma_u^+)$ with the collision partners CH_4 , CH_3Cl , CF_3Cl , and CF_4 . R.J.Donovan, B.V.O'Grady, L.Lain, C.Fotakis (Dept. of Chem., Univ. of Edinburgh, Edinburgh, Scotland).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3727-31 (15 March 1983).

Fluorescence from the $D^1\Sigma_u^+$ state of I_2 , and from other ion-pair states populated as a result of inelastic collisions with the molecules CH_4 , CH_3Cl , CF_3Cl , and CF_4 , was studied throughout the 200-510 nm region. $I_2(D^1\Sigma_u^+)$ was optically pumped using an ArF laser ($\lambda = 193$ nm) and the above spectral region recorded with single laser shots by employing an optical multichannel analyzer. The physical quenching of $I_2(D^1\Sigma_u^+)$ was found to involve an electronic cascade, through intermediate states, terminating in the lowest ion-pair state $I_2(^1\Pi_{2g})$. The presence of reactive channels was identified by the reduction in I_2 fluorescence following successive laser shots. Fluorescence from $I_2(D^1\Sigma_u^+)$ was also studied following excitation with a CW mercury lamp ($\lambda = 185$ nm) and Stern-Volmer analysis of these data yielded total removal rate constants (reactive+inelastic channels), viz. $k(CH_4) = (7.9 \pm 0.3) \times 10^{-10}$, $k(CH_3Cl) = (21.0 \pm 1.0) \times 10^{-10}$, $k(CF_3Cl) = (7.1 \pm 0.4) \times 10^{-10}$, $k(CF_4) = (6.0 \pm 1.0) \times 10^{-10}$ [all in cm^3 molecule $^{-1}$ s $^{-1}$ units]. The presence of reactive channels was confirmed using end-product analysis techniques and it was shown that the lowest ion-pair state $I_2(^1\Pi_{2g})$ also reacts with CH_4 and possibly with CF_3Cl . (12 refs.)

63525 Unimolecular and bimolecular reactions in the $C_4H_6^+$ system: experiment and theory. M.F.Jarrold, L.M.Bass, P.R.Kemper, P.A.M.van Koppen, M.T.Bowers (Dept. of Chem., Univ. of California, Santa Barbara, CA, USA).

J. Chem. Phys. (USA), vol.78, no.6, pt.2, p.3756-66 (15 March 1983).

New experimental data on the metastable reactions of $C_4H_6^+$ are presented. The bimolecular reactions between $C_2H_2^+$ and C_2H_4 and between $C_2H_4^+$ and C_2H_2 have been reinvestigated using a tandem ICR. Total rate constants and branching ratios were measured and isotopic scrambling investigated using deuterium labeling. The experimental data reported here and the

PIPECO data of Werner and Baer [J. Chem. Phys. 62, 2900 (1975)] are compared with the predictions of the transition state switching model. Good agreement was found between the predictions of the model and the experimental data. The branching ratios were found to be strong functions of both energy and angular momentum. In the bimolecular reaction between C_2H_2 and C_2H_4 charge transfer appears to occur predominantly via a loosely bound intermediate which only samples a small volume of the available $C_2H_6^+$ phase space. (45 refs.)

63526 The unimolecular decomposition rates of energy selected methylnitrite and deuterated methylnitrite ions. J.P.Gilman, T.Hsieh, G.G.Meisels (Dept. of Chem., Univ. of Nebraska, Lincoln, NE, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3767-73 (15 March 1983). The fragmentation of methylnitrite ion (CH_3ONO^+) involves dissociation from noninterconverting electronic states characterized by the formation of CH_3O^+ ($m/z=31$) and NO^+ ($m/z=30$) ions. The lifetimes of the precursors of these ions have been determined from ion time-of-flight curves obtained by threshold photoelectron-photoion coincidence (TPEPICO) mass spectrometry. The deuterated methylnitrite ion (CD_3ONO^+) was also studied to examine the kinetic isotope effects on ion lifetimes. The rate constants for the reactions leading to the formation of CH_3O^+ and CD_3O^+ were found to be independent of internal energy over ~ 0.2 and 0.9 eV, respectively. The isotope effect increases with increasing internal energy, contrary to that expected from the quasiequilibrium theory (QET) of mass spectra. The authors suggest that methylnitrite ion fragmenting to CH_3O^+ and NO^+ occurs from noncompeting noninterconverting electronic states involving a surface crossing. (36 refs.)

63527 The reaction $Hg + I_2 \rightarrow HgI + I$ revisited. M.M.Oprysko, F.J.Aoiz, M.A.McMahan, R.B.Bernstein (Dept. of Chem., Columbia Univ., New York, NY, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3816-31 (15 March 1983). The crossed molecular beam study of Mayer et al. (1977) on the subject reaction is revisited. The present work employs a different beam configuration and thus kinematic framework, and a larger range of relative translational energies is covered (i.e. from the threshold of 1.15 to 3.75 eV). Measurements include in-plane angular distributions and relative values of integral reaction cross sections as a function of energy. At low energies, the results of the present experiments are in good agreement with the previous work. Starting at the threshold, the reaction proceeds through the formation of a long-lived complex, presumed to be $IHgI$. At higher energies, the c.m. angular distributions show a gradual increase of the so-called 'backscattered component'. This is interpreted as the opening of a new reaction path: the direct-mode abstraction of I via collinear approach of the Hg atom to the I_2 molecule. The overall dynamics of this reaction are interpreted in the context of the semiempirical potential energy surfaces and electronic state correlation diagrams of Muckerman et al. (1977). From the present experimental results, the height of the barrier in the exit channel for the collinear configuration can be estimated to be in the range 2.0-2.3 eV. The excitation function rises from threshold and reaches a maximum at collision energy of 2.6 eV, falling off monotonically thereafter. (58 refs.)

63528 Oscillating reactivity of collinear symmetric heavy+light-heavy atom reactions. C.Hiller, J.Maniz (Lehrstuhl für Theoretische Chem., Tech. Univ. München, Garching, Germany), W.H.Müller, J.Romelt. *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3850-6 (15 March 1983). The oscillatory reaction probability (as a function of energy) of collinear heavy+light-heavy systems (e.g. $I+HI \rightarrow IH+I$) that has been seen in earlier quantum mechanical reactive scattering calculations is shown to be described quantitatively by a semiclassical WKB model. Because these reactions are highly vibrationally adiabatic they reduce to a two-state symmetric resonance system (analogous to symmetric charge transfer, e.g. $H^+ + H \rightarrow H + H^+$) that involves only the phase shifts of the one-dimensional g (symmetric) and u (antisymmetric) combinations of the two states. Comparisons of the semiclassical and quantum mechanical reaction probabilities over a wide range of energy for the cases $I+MuI \rightarrow IMu+I$ and $I+HI \rightarrow IH+I$ show almost perfect agreement. The vibrationally adiabatic symmetry exchange problem is also solved classically (analytically) and is seen to have an interesting relation to the quantum/semiclassical result. The classical reaction probability is also an oscillatory function of energy, although the structure of the oscillations is different from the quantum/semiclassical ones ('saw-tooth' rather than sinusoidal) and the phase of the classical oscillations is only approximately the same as that of the quantum/semiclassical case. (In the high energy limit, the phase of the oscillations increases roughly as the square root of collision energy.) Thus, though the classical (light atom hopping between two heavy atoms) and quantum mechanical (resonance interference of g and u collision channels) interpretations of the oscillatory reactivity seem at first to be quite different, they are seen in fact to be essentially the same. (40 refs.)

63529 Vibrational energy transfer efficiency in a three-channel thermal unimolecular system. Temperature dependence. V.V.Krongauz, B.S.Rabinovitch (Dept. of Chem., Univ. of Washington, Seattle, WA, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3872-80 (15 March 1983). Thermal isomerization in the three-channel cyclopropane-1,1,2,2,2 system was studied at 823 and 973K in the presence of Kr and CO_2 bath gases. It was found that CO_2 is more efficient in energy transfer from the hot cyclopropane than Kr, which is more efficient than He. For the stepladder model of energy transfer, the average energy removed per collision from energized cyclopropane-1,1,2,2,2 by a bath gas (ΔE) for Kr is 780 ± 90 cm $^{-1}$ at 823K and 520 ± 70 cm $^{-1}$ at 933K; while for CO_2 it is 1220 ± 90 cm $^{-1}$ at 823K and 800 ± 70 cm $^{-1}$ at 973K. The relative collision efficiency of both bath gases β_{rel} also declines with temperature rise. For Kr, β_{rel} is 0.17 at 823K and 0.07 at 973K; for CO_2 , β_{rel} is 0.40 at 823K and 0.17 at 973K. Comparison is made with earlier results. A T^{-1} ($\gamma \sim 5.5$) temperature dependence fits the existing data for He/cyclopropane systems and is in accord with the computational deductions of Tardy and Rabinovitch (1977). For stronger colliders, e.g. Kr and CO_2 , the temperature dependence of β_{rel} should be less than He. A value of ≈ 1 kcal/mol for the activation energy difference for T and H migration during cyclopropane-1,1,2,2,2 isomerization was confirmed. (36 refs.)

63530 Ab initio study of electronic coupling in the aqueous Fe^{2+}/Fe^{3+} electron exchange process. J.Logan, M.D.Newton (Dept. of Chem., Brookhaven Nat. Lab., Upton, NY, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.4086-91 (15 March 1983). Electronic Hamiltonian matrix elements between initial and final zeroth order states associated with electron exchange in the hexa-aquo Fe^{2+}/Fe^{3+} redox system has been calculated in terms of self-consistent field (SCF) ab initio wave functions. The face-to-face and apex-to-apex approach geometries of the quasi-octahedral reactants have been modeled, respectively, by the $[Fe(H_2O)_6]^{2+}$ cluster (D_{3h} symmetry) and the $[Fe(H_2O)_6]^{3+}$ cluster (O_h symmetry). For the latter cluster, the Condon approximation has been tested and found to be accurate to within ~ 1 cm $^{-1}$ for the important range of inner-shell FeO distances. The calculations employ ab initio effective core potentials for inner-shell electrons and explicitly

include all metal and ligand valence electrons. Due to weak 3d-3d overlap, the energy-preferred SCF solutions are charge localized (i.e. symmetry broken: $S_g \rightarrow C_3$ and $D_{2h} \rightarrow C_{2v}$). The present results for the interpenetrating face-to-face approach geometry are quite similar to earlier results based on a crystal-field model, implying an electronic transmission factor (κ) of $\sim 1/5$ at the most probable reactive encounter separation (5.3 Å). The alternative apex-to-apex approach geometry is found to be less kinetically favorable. Attempts to fit calculated values of the electronic matrix elements to functions of the form $P_n(r) \exp(-ar)$ for the range $r \sim 5-8$ Å, where r is the Fe...Fe separation in Å and $P_n(r)$ is a polynomial, yield values of a ranging from 0.8 to 2.4 Å $^{-1}$, depending on the values of n and m , the orientation of reactants, and the model employed for the ligands. The calculated matrix elements are found to be rather insensitive with respect to variation of certain features of the SCF wave functions. (22 refs.)

63531 Smoluchowski-Vlasov theory of charge solvation dynamics. D.F.Calef, P.G.Wolynes (Dept. of Chem., Harvard Univ., Cambridge, MA, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.4145-53 (15 March 1983). The dynamics of polar solvent reorganization near an instantaneously created charge are investigated. A linear, Vlasov-type equation is derived, where the interactions between the polar molecules are treated using a mean field term containing the direct correlation function. For the diffusive limit, a Smoluchowski-Vlasov equation for reorientation is studied. The results, for model solvents, are compared to the results from continuum dielectric theories, to experimental results, and to results from recent computer simulations. (25 refs.)

63532 A quasiclassical trajectory study of the $F+HH \rightarrow FH+H$ reaction. S.Ron (Israel Atomic Energy Comm., Tel-Aviv, Israel), M.Baer, E.Pollak. *J. Chem. Phys. (USA)*, vol.78, no.7, p.4414-22 (1 April 1983). A detailed forward and reverse quasiclassical trajectory computation for the FHH reaction is presented. An adiabatic analysis of the results shows that to a large extent the differences between HF($v=3$) and HF($v=2$) product distributions are due to the existence of an exit channel adiabatic barrier for the $v=3$ state. A sideways peak in the angular distribution for HF($v=2, j$) is found in the reverse quasiclassical computation. Total cross sections computed from reverse quasiclassical trajectories are in good agreement with the quantum I_{01} reactive infinite order sudden approximation. The authors conclude that many of the discrepancies between forward quasiclassical results and quantum computations are not due to quantal resonances but rather to the large boxing of vibrational states. (29 refs.)

63533 Trajectory studies within the framework of the infinite order sudden approximation for the $F+H_2 \rightarrow HF+H$ reaction. J.Jellinek (Dept. of Chem. Phys., Weizmann Inst. of Sci., Rehovot, Israel), M.Baer. *J. Chem. Phys. (USA)*, vol.78, no.7, p.4494-501 (1 April 1983). A detailed classical mechanical study of the $F+H_2$ reaction within the framework of the infinite order sudden approximation (IOSA) is presented. The main object of this research was to study the sensitivity of the state-to-state and total opacity functions and cross sections with respect to a parameter B which determines the border between the reagents and products channels. It was found that the results tend to vary when the value of B is changed but, within a particular range of B values, the IOSA results fit the exact results very nicely. Results of an approach where B is eliminated are also presented and compared with those obtained with the other treatments. (15 refs.)

63534 Adiabatic T matrix theory for three dimensional reactive scattering: application to the (H_2H_2) system. J.C.Sun, B.H.Choi, R.T.Poe, K.T.Tang (Dept. of Phys., Univ. of California, Riverside, CA, USA). *J. Chem. Phys. (USA)*, vol.78, no.7, p.4523-32 (1 April 1983). The authors present an adiabatic transition matrix (T matrix) method of atom-molecule reactive scattering. In this method, the coupling between vibrational and rotational motions is taken into account for obtaining the adiabatic molecular wave functions. These wave functions are expanded in terms of the basis functions taken from the eigenfunctions of a double well potential. From the full potential surface in the linear configuration of three atoms, the double well potential is obtained. Convergence of the expansion is achieved for evaluating the adiabatic wave functions and two body atom-molecule interaction potential. Cross sections are computed with the T matrix method employing the converged adiabatic wave functions. Numerical results for the $H+H_2$ reactive cross section on an ab initio potential surface are presented. Results on $D+H_2$ reaction will be reported in a subsequent paper. The differential cross sections and final state distributions computed from the present adiabatic T matrix method are similar to ones obtained from the adiabatic distorted wave approximation which the authors published earlier. However, the absolute cross section from the present approach is considerably larger than the previous one. The present results on the reactive cross section are in very good agreement with those obtained from a close coupling calculation. The present cross sections are much bigger than the classical ones in the threshold region. Among the cross sections from various T matrix approaches, the present one is the largest and seems to be most accurate. (36 refs.)

63535 Reaction of ketenes with atomic oxygen. N.Washida, S.Hatakeyama, H.Takagi (Div. of Atmospheric Environment, Nat. Inst. for Environmental Studies, Ibaraki, Japan), T.Kyogoku, S.Sato. *J. Chem. Phys. (USA)*, vol.78, no.7, p.4533-40 (1 April 1983). Rate constants for the reaction of atomic oxygen with ketene, and methyl, ethyl, and dimethyl ketene were measured over a temperature range of 230-449K using the pulse radiolysis resonance absorption system. Over the temperature range of the experiments, the rate data could be fitted by Arrhenius expressions: $O+CH_3CO$, $(2.92 \pm 0.78) \times 10^{-12} \exp(-1349 \pm 154 \text{ cal mol}^{-1}/RT)$; $O+(CH_3)CHCO$, $(4.79 \pm 1.31) \times 10^{-12} \exp(494.9 \pm 163.2 \text{ cal mol}^{-1}/RT)$; $O+(C_2H_5)CHCO$, $(5.36 \pm 0.83) \times 10^{-12} \exp(444.6 \pm 94.0 \text{ cal mol}^{-1}/RT)$; $O+(CH_3)_2CCO$, $(5.92 \pm 0.94) \times 10^{-12} \exp(1131 \pm 85 \text{ cal mol}^{-1}/RT)$; in units of cm 3 molecule $^{-1}$ s $^{-1}$. The rate constants at room temperature were also determined using a discharge-flow system coupled to a photoionization mass spectrometer. Rate constants obtained are 0.043 ± 0.04 , 1.16 ± 0.13 , 1.36 ± 0.11 , and $6.04 \pm 0.64 \times 10^{-11}$ cm 3 molecule $^{-1}$ s $^{-1}$ for CH_3CO , $(CH_3)CHCO$, $(C_2H_5)CHCO$, and $(CH_3)_2CCO$, respectively. Several reaction products were analyzed by the photoionization mass spectrometer. (29 refs.)

63536 Comments on 'Kinetics and mechanism of the U-H reaction'. J.B.Condon (Nuclear Div., Union Carbide Corp., Oak Ridge, TN, USA). *J. Less-Common Met. (Switzerland)*, vol.90, no.1, p.19-11 (March 1983). The author presents arguments to alleviate any possible misunderstanding that might result from the paper by Block and Mintz (1981) in which the perfluoro precipitation model, which Condon (1975) and others have successfully applied to the U-H system, was given an abrupt dismissal. (13 refs.)

63537 A new formalism of chemical exchange near the region of intermediate rate. K. Kimura (Instrument Center, Inst. for Molecular Sci., Okazaki, Japan).

J. Magn. Resonance (USA), vol. 52, no. 1, p. 13-22 (March 1983).

The Bloch equation incorporating chemical exchange between two environments is solved and is expanded in a power series of the exchange lifetime τ . The expansion near the fast exchange region is given by a power series in τ of which the first term corresponds to the fast exchange limit. The second term together with the first term defines the 'boundary' intermediate exchange region. In the slow exchange region, the expansion in both exchange regions are examined and as a result the chemical exchange is divided into five regions: fast limit, fast intermediate, pure intermediate, slow intermediate, and slow limit. In the 'pure' intermediate region, a conventional simulation procedure is needed in order to determine the exchange rate. On the other hand, an analytical form is derived for the linewidth in the other regions. The linewidth as a function of exchange rate, transverse relaxation time, content of component species, and chemical shift difference between two environments is examined in the light of the proposed formula. (8 refs.)

63538 Influence of extended defects and of the porous texture in the reduction of chromium dioxide. R. Saez-Puche, M.A. Alario-Franco (Dept. de Quimica Inorganica, Univ. Complutense, Madrid, Spain).

J. Solid State Chem. (USA), vol. 47, no. 1, p. 59-68 (15 March 1983).

The hydrogen reduction of very small single crystalline particles of CrO_2 to orthorhombic CrOOH is impeded by the presence of extended defects, crystallographic shear planes, formed in the process of attaining the reduction temperature in vacuum. However, if CrO_2 is predecomposed to a large extent, a porous texture is formed that facilitates the reduction. These results are in full agreement with a previously proposed reaction mechanism based on unidimensional diffusion. (20 refs.)

63539 The thermal stability of calcium uranates in a hydrogen atmosphere. J. Holc, D. Kolar (E. Kardelj Univ., Ljubljana, Yugoslavia).

J. Solid State Chem. (USA), vol. 47, no. 1, p. 98-102 (15 March 1983).

The stability and decomposition of CaUO_4 , Ca_2UO_6 , and Ca_3UO_7 on heating over hydrogen were investigated by X-ray powder diffraction and thermogravimetry. Ca_2UO_6 decomposes at 450°C into $\text{Ca}_2\text{UO}_{4.5}$ with a triclinic unit cell. At 850°C , it changes to monoclinic $\text{Ca}_2(\text{Ca}_{0.67}\text{U}_{0.33})\text{UO}_6$ which loses some oxygen up to the composition $\text{Ca}_2(\text{Ca}_{0.67}\text{U}_{0.33})\text{UO}_{5.83}$. At 1100°C , it decomposes to a UO_2 solid solution with CaO . CaUO_4 decomposes at 900°C to $\text{Ca}_2(\text{Ca}_{0.67}\text{U}_{0.33})\text{UO}_{5.83}$ and CaU_2O_6 . The decomposition products of Ca_3UO_7 at 850°C are $\text{Ca}_2(\text{Ca}_{0.67}\text{U}_{0.33})\text{UO}_{5.83}$ and CaO . (11 refs.)

63540 The oxidation of methanol on Cu(100) studied by infrared spectroscopy. R. Ryberg (Phys. Dept., Chalmers Univ. of Technol., Goteborg, Sweden).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol. 29, p. 59-60 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Summary form only given as follows: Infrared spectroscopy has been used to study the C-O stretch vibrational mode of different coverages of CH_3O adsorbed on a Cu(100) surface. The spectra is taken with a resolution of 4 cm^{-1} and a scan time of 20 minutes. There is a large coverage dependent shift of the vibration frequency, which is mainly caused by the dipole-dipole interaction between the adsorbed molecules. (no refs.)

63541 Elementary reactions of the NCl radical. I. Rate constants for the reactions $\text{NCl} + \text{NCl} \rightarrow \text{N}_2 + 2\text{Cl}$ and $\text{O} + \text{NCl} \rightarrow \text{NO} + \text{Cl}$. M.A.A. Clyne, A.J. MacRobert.

J. Chem. Soc. Faraday Trans. II (GB), vol. 79, pt. 2, p. 283-93 (Feb. 1983).

A kinetic study of the NCl radical at 295K has been carried out in a discharge-flow system using mass-spectrometric detection with molecular-beam sampling. NCl radicals were generated by the reaction of Cl atoms with N_2Cl : $\text{Cl} + \text{N}_2\text{Cl} \rightarrow \text{N}_2 + \text{Cl}_2$ and $\text{Cl} + \text{N}_2\text{Cl} \rightarrow \text{NCl}(\text{b}^2\Sigma^+)$, $(\text{a}^4\Delta)$, $(\text{X}^2\Sigma^-) + \text{N}_2$. Metastable excited-state $(\text{a}^4\Delta)$, $(\text{b}^2\Sigma^+)$ NCl radicals were shown to react with Cl_2 to produce NCl_2 radicals: $\text{NCl}^* + \text{Cl}_2 \rightarrow \text{NCl}_2 + \text{Cl}$. The rate constants (295K) for the following reactions of ground-state $(\text{X}^2\Sigma^-)$ NCl radicals have been measured: $\text{NCl} + \text{NCl} \rightarrow \text{N}_2 + 2\text{Cl}$ and $\text{O} + \text{NCl} \rightarrow \text{NO} + \text{Cl}$. (22 refs.)

63542 X-ray topographic investigations of solid state reactions. I. Changes in surface and bulk substructure during incipient thermal decomposition in sodium chlorate monocrystals. I.D. Begg, P.J. Halfpenny (Dept. of Electrical Engng., Univ. of Southampton, Southampton, England), R.M. Hooper, R.S. Narang, K.J. Roberts, J.N. Sherwood.

Proc. R. Soc. London Ser. A (GB), vol. 386, no. 1791, p. 431-42 (8 April 1983).

On heating, sodium chlorate monocrystals undergo a limited degree of thermal decomposition in the solid state (0.1-1% mass loss) between 450K and the melting point, ca. 535K . Examination of thermally treated pristine surfaces with a microscope reveals distributions of decomposition sites characteristic of the reaction initiating where emergent dislocations intersect the crystal surface. There is little correlation, however, between dislocation etch-pits and decomposition centres. X-ray topographic studies of changes in bulk substructure during thermal treatment confirm that 'grown in' dislocations play little or no part in the nucleation of the decomposition process in the bulk; they may, however, contribute to the surface reaction. In the bulk, the potential nuclei are strained regions in the lattice. From these, and possibly from decomposition, dislocation loops are punched out into the surrounding lattice along (100) and (110) directions. Similar defects are emitted from localized regions at the surface, which may give rise to the surface decomposition patterns. Impurity doped crystals show considerably enhanced decomposition. (31 refs.)

63543 State-to-state and state-to-all-states reactive scattering angular distributions: $\text{F} + \text{H}_2 \rightarrow \text{HF} + \text{H}$. R.W. Emmons, S.H. Suck (Dept. of Phys., Univ. of Missouri, Rolla, MO, USA).

Phys. Rev. A (USA), vol. 27, no. 4, p. 1803-11 (April 1983).

How each state-to-state reactive transition determines nonundulatory 'state-to-all-states' angular distribution has not yet been investigated. The authors present a complete exposure of state-to-state distorted-wave Born-approximation angular distributions in order to examine how the nonoscillatory and backward-peaked state-to-all-states reactive scattering angular distribution occurs. (16 refs.)

63544 Stereochemical rearrangements of complexes in liquid crystals. I.G. Bikhantaev, I.V. Ovchinnikov (Kazan' Inst. of Tech. Phys., Acad. of Sci., USSR).

Theor. & Exp. Chem. (USA), vol. 18, no. 2, p. 201-3 (March-April 1982). Translation of: *Teor. & Ekspr. Khim. (USSR)*, vol. 18, no. 2, p. 233-5 (March-April 1982). [received: Feb. 1983]

The authors show how the use of liquid crystals permits, in principle, a new approach to the solution of the problem of stereochemical rearrangements in solution. As an example illustrating the proposed method, the stereochemical rearrangement reactions in a solution of fluorine-substituted copper β -diketonate with collidine are considered. The complex is dissolved in a eutectic mixture of MBBA and EBBA and after rapid freezing of the matrix, the ESR signals are examined. (3 refs.)

82.35 POLYMER REACTIONS AND POLYMERIZATION

63546 Equilibrium polymerization in one dimension: exact solution by transfer matrix and renormalization group. P.M. Pfeuty (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France), J.C. Wheeler.

Phys. Rev. A (USA), vol. 27, no. 4, p. 2178-95 (April 1983).

Equilibrium polymerization is very different in one dimension than in higher dimensionality. The transition that occurs in the limit of vanishing initiation equilibrium constant (which is a critical point in higher dimensionality) becomes a first-order transition at nonvanishing temperature in one dimension. A simple model of equilibrium polymerization that has been discussed recently for higher dimensionality is solved exactly by the transfer-matrix method in one dimension. The equivalent $n=0$ vector model of magnetism is also solved exactly for all fields and temperatures by transfer-matrix methods and is analyzed by an exact renormalization-group transformation. The renormalization-group analysis contains several interesting features including the fact that the parameter space of the Hamiltonian must be enlarged to six dimensions, yet remains finite. The connection of the model and transition treated here with the Zimm-Bragg model of the helix-coil transition and with the one-dimensional Ising model of magnetism is discussed. (26 refs.)

63547 Thermooxidative stability of polypropylene under the simultaneous action of high pressure and shear strains. V.A. Zhorin, N.Ya. Rapoport, A.N. Kryuchkov, L.S. Shibrayeva, N.S. Enikolopyan.

Vysokomol. Soedin. Ser. A (USSR), vol. 25, no. 3, p. 578-81 (March 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*

Thermooxidative stability of polypropylene is increased after the simultaneous action of high pressure and shear strains. The more the pressure is, the more the effect is observed. Introduction of the reactive monomer results in an increase of the induction time and decrease of the rate of oxidation, while introduction of amorphous SiO_2 results in an increase of the induction time without the change of the rate of oxidation. (13 refs.)

63548 Vinyl polymerization initiated by reducing compounds of transition metals. I. The polymerizing initiating effect of chromium (II) and titanium (II) compounds. N. Moszner, M. Hartmann (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany).

Wiss. Z. Friedrich-Schiller-Universität Jena, Math. Naturwiss. Reihe (Germany), vol. 31, no. 6, p. 1139-49 (1982). In German.

The polymerization initiating effect of reducing compounds of transition metals such as chromium (II) and titanium (III) in the presence of organic compounds is described. Thereby the selective graft copolymerization in the

presence of chromium (II) and compounds and titanium (II) chloride are discussed. (70 refs.)

63549 Synthesis and properties of poly(maleic anhydride). M.Hartmann, B.Schulz (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany). *Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.1151-9 (1982). In German.

A review is given both of the knowledge of the mechanism of the homopolymerization of maleic anhydride (MA), and the structures, properties and uses of poly(maleic anhydride). During the free-radical polymerization of MA linear polymers with succinic anhydride structure units are formed through the usual vinyl polymerization. The mechanism of the anionic MA-polymerization depends on the base used, there is no general conformity concerning the anionic polymerization mechanism and the structures of polymers formed in this reaction. 82.40 CHEMICAL KINETICS AND REACTIONS: SPECIAL REGIMES

63550 Premixed, turbulent combustion of a sudden-expansion flow. Y.El Banhawy (Ain-Shams Univ., Cairo, Egypt), S.Sivasegaram, J.H.Whitelaw. *Combust. & Flame (USA)*, vol.50, no.2, p.153-65 (March 1983).

Measurement of mean values of velocity, temperature and concentrations of carbon monoxide, carbon dioxide, unburned hydrocarbon, and oxygen have been obtained in the two-dimensional flows downstream of two backward facing steps which stabilized premixed methane-air flames of equivalence ratios 0.77, 0.90 and 0.95. The maximum mean temperature increased from 1710 to 2000K with equivalence ratio, and the maximum intensity of the temperature fluctuations, like those of velocity fluctuations, was close to coincident with inflections in the mean profiles. The intensity of the temperature fluctuations achieved values in excess of unity and, at the locations of maximum mean temperature, in excess of 0.5. The larger step gave rise to a wider reaction region and to a slightly different trajectory. An increase in the flow rate of cooling water and therefore, a decrease of wall temperature resulted in increased concentrations of unburned hydrocarbon and carbon monoxide in the near-wall region. Discrete frequency fluctuations occurred at the natural frequency of the flow chamber: the magnitude of the energy of these fluctuations was small. (19 refs.)

63551 Flame quenching by a cold wall. J.Jarosinski (Inst. of Aeronautics, Warsaw, Poland).

Combust. & Flame (USA), vol.50, no.2, p.167-75 (March 1983).

Quenching of upward and downward propagating flames in narrow channels is studied. The speed and the instantaneous flame temperature were measured and Schlieren photography was used in experiments. The experiments were carried out in a vertical 50X50-mm² tube 1 m long, with channels. Flame characteristics of methane-air mixtures were determined over the entire burning range. The results of the experiments showed that the channel quenching distance is, over the entire burning range. The results of the experiments showed that the channel quenching distance is, over the entire range of mixture composition, twice as wide as the flame thickness. These conditions are equivalent to the Peclet number $Pe = uD/a = 39$, where u and D , determined empirically, are the burning velocity and the quenching distance, respectively, and a is the thermal diffusivity of the unburned mixture. The appropriate Peclet number determined earlier for tubes was $Pe = 46$ (Putnam and Jensen, Third Symposium on Combustion, 1949, p.89). (16 refs.)

63552 Convective instabilities of binary mixtures with fast chemical reaction in a porous medium. V.Steinberg, H.Brand (Univ. of California, Santa Barbara, CA, USA).

J. Chem. Phys. (USA), vol.78, no.5, p.2655-60 (1 March 1983).

The instabilities which can occur when a layer of a binary mixture with fast chemical reaction in a porous medium is heated from below or from above are investigated. The authors find that both a stationary instability or an oscillatory instability can occur as the first bifurcation depending on the sign and the magnitude of the heat of reaction. (12 refs.)

63553 Instability of surface combustion on exposure to laser radiation. F.V.Bunkin, N.A.Kirichenko, B.S.Luk'yanchuk (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).

Sov. J. Quantum Electron. (USA), vol.12, no.10, p.1276-80 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.1959-67 (Oct. 1982). [received: April 1983]

An analysis is made of laser heating of a material on the surface of which an exothermic reaction takes place (oxidation). It is shown that there are critical values of the radiation parameters (beam radius and intensity) above which the thermal field becomes unstable and a combustion wave propagates without restriction over the surface of the material. The characteristic instability evolution times are found. The theory developed in the present paper agrees with the results of experiments on laser combustion of metals. (9 refs.)

63554 The calculation of a fire in a large building. H.W.Emmons (Div. of Appl. Sci., Harvard Univ., Cambridge, MA, USA).

Trans. ASME. J. Heat Transfer (USA), vol.105, no.1, p.151-8 (Feb. 1983).

The complex picture presented by a fire growing in a large building can be understood by considering the process is made up of a large number of space, time, and phenomena zones each one of which is to some degree independent of all others. This approach is explained in detail, the appropriate equations now in use in the Computer Fire Code are listed and some results compared with full-scale experimental results. (15 refs.)

63555 Soot volume fraction profiles in forced-combusting boundary layers. R.A.Beier, P.J.Pagni (Dept. of Mech. Engng., Univ. of California, Berkeley, CA, USA).

Trans. ASME. J. Heat Transfer (USA), vol.105, no.1, p.159-65 (Feb. 1983).

A multiwavelength laser transmission technique is used to determine soot volume fraction fields and approximate particle size distributions in a forced flow combustor boundary layer. Measurements are made in diffusion flames of polymethylmethacrylate (PMMA) and five liquid hydrocarbon fuels (n-heptane, iso-octane, cyclohexane, cyclohexene, and toluene) with ambient oxygen mass fractions in the range of 0.235 $Y_{O_2} \leq 0.50$. Soot is observed in a region between the pyrolyzing fuel surface and the flame zone. Soot volume fraction increases monotonically with Y_{O_2} , e.g. n-heptane and PMMA are similar with soot volume fractions, f_v , ranging from $f_v \sim 5 \times 10^{-7}$ at

$Y_{O_2} = 0.23$ to $f_v \sim 5 \times 10^{-6}$ at $Y_{O_2} = 0.50$. For an oxygen mass fraction the same as air, $Y_{O_2} = 0.23$, soot volume fractions are approximately the same as values previously reported in pool fires and a free combustor boundary layer. However, the shape of the f_v profile changes with more soot near the flame in forced flow than in free flow due to the different y-velocity fields in these two systems. For all fuels tested, a most probable particle radius is between 20 nm and 80 nm, and does not appear to change substantially with location, fuel, or oxygen mass fraction. (33 refs.)

82.40T Chemiluminescence and chemical laser kinetics (see also 42.55K Chemical lasers, 78.60P Chemiluminescence)

63556 The exposure dependence and emission spectrum of chemiluminescence produced during the oxidation of Si (111) by O₂. G.D.Kubiak, G.Sitz, J.E.Hurst, Jr., R.N.Zare (Dept. of Chem., Stanford Univ., Stanford, CA, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.139 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

Summary form only given as follows. Chemiluminescence produced during the low pressure oxidation of a Si(111) surface by O₂ has been investigated. Carefully cleaned and annealed samples yield chemiluminescence at pressures as low as 6×10^{-7} torr, corresponding to a peak chemiluminescence yield of 2.2×10^{-7} photons per incident molecule and comparing favorably with the value of 1×10^{-7} measured by Bruce and Comas (1971). The evolution of the emission shows a hyperbolic decrease in time at pressures above 1×10^{-4} torr but becomes more complex at the lowest exposures studied. The spectrally broad chemiluminescence was dispersed at medium resolution and recorded with an Optical Multichannel Analyzer in an attempt to identify and characterize the energy content of the emitting species. (1 ref.)

63557 Laser-induced decomposition of sodium azide. H.Y.Chiu, R.C.Benson (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA).

J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.29, p.141-6 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).

The decomposition of sodium azide, NaN₃, has been studied using a pulsed carbon dioxide laser. Chemiluminescence associated with the decomposition has been measured with and without the azide surface in the detector field of view. Near the decomposition threshold, emission has been observed in the wings of the Na 3p—3s transition at 589 nm that has not been observed in previous azide decomposition experiments. This emission may be a result of surface reactions. Raman and visible absorption spectra have been obtained for the irradiated material; a new, as yet unidentified, band was observed in the Raman spectrum. (7 refs.)

63558 Solvatochromism of ketocyanines: binary complexes. V.V.Danilov, G.G.Dyadyusha, A.A.Rykov.

Opt. & Spectrosc. (USA), vol.53, no.1, p.38-41 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.67-72 (July 1982). [received: April 1983]

Results are presented for studies of the spectral and luminescence characteristics of ketocyanines in two-component solvents. It is shown that the addition of small amounts of a proton donor to solutions of ketocyanines in inert solvents results in the formation of a ketocyanine-proton donor complex having a 1:1 composition. The solvatochromism of the complex itself is investigated. (7 refs.)

63559 Chemiluminescent SiCl₄+O₂+Ar(He) reactions. B.Kulakowska, W.Zyrnicki (Inst. of Inorganic Chem. & Metall. of Rare Elements, Tech. Univ. of Wrocław, Wrocław, Poland).

Spectrosc. Lett. (USA), vol.15, no.12, p.969-81 (1982).

A chemiluminescent flame was formed in the reaction between SiCl₄ and oxygen in an atmosphere of argon or helium. Internal state distributions of some reaction products were studied. Inverted vibrational populations in the A¹π and F²π_g states of SiO were observed. The relative electronic populations of atomic silicon and relative rotational populations in the SiO A¹π state corresponded to temperatures of about 3400K and 400K, respectively. (17 refs.)

(see also 66.10 Ionic conduction in liquids; for electro-osmosis, see 82.65)

63560 Photoelectrochemical behavior of Co²⁺ doped-zinc oxide electrodes. M.Jakani, G.Campet, B.Tanouti, R.Salmon, J.-C.Launay (Univ. de Bordeaux-I, Talence, France), J.Kossanyi, J.Clavierie.

C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.5, p.357-60 (7 Feb. 1983). In French.

Zn_{0.99}Co_{0.01}O single crystal photoanodes show a large visible photocurrent down to 750 nm. Mechanisms responsible for this photoresponse are discussed. (8 refs.)

63561 Anodic polarization behaviour of hydride-deuteride electrodes. S.Wakao, Y.Yonemura (Tokai Univ., Kanagawa, Japan).

J. Less-Common Met. (Switzerland), vol.89, no.2, p.481-8 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Tobu, Japan, 30 May-4 June 1982).

The results of electrochemical measurements performed on hydrogen-absorbing metal electrodes such as LaNi_{5-x}Al_x (x=0-1.0), MnNi₄Al (Mn=misch metal), LaNi₄Cu and TiNi_{0.6} are reported. The equilibrium hydrogen pressure; partial molar enthalpy ΔH and partial molar entropy ΔS

of hydride (or deuteride) formation were calculated on the basis of their electrode potentials. The values determined electrochemically agreed very closely with those obtained from the solid-gas equilibrium. The current is strongly governed by the diffusion process at a large anodic polarization of the hydride-deuteride electrodes. The experimental current-overpotential curves are discussed on the basis of electrode and diffusion theory. In the case of hydride electrodes with a small value of $-\Delta H$ the diffusion species are mainly the OH^- (or OD^-) ions in the electrolyte solution. As the value of $-\Delta H$ increases, the activation energy of diffusion becomes larger and the diffusion species become the hydrogen (or deuterium) atoms in the metal. (7 refs.)

63562 Hydrogen evolution at LaNi₅-type alloy electrodes. H.Tamura, C.Iwakura, T.Kitamura (Dept. of Appl. Chem., Osaka Univ., Osaka, Japan), *J. Less-Common Met. (Switzerland)*, vol.89, no.2, p.567-74 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982). Several LaNi₅-type alloy electrodes were prepared and their cathodic polarization characteristics in alkaline solutions were investigated. As a result, they were found to have a high electrocatalytic activity for the hydrogen evolution reaction compared with the constituent metals, and their activities were almost comparable with those of platinum and palladium electrodes. Such a synergism was attributed to the large heat of formation of these alloys. The surface damage of these alloy electrodes was also found to be prevented by controlling the temperature and current density. (12 refs.)

63563 On the electrokinetic energy conversion in liquid mixtures. R.Hidalgo-Alvarez, F.Gonzalez-Caballero, G.Pardo (Dept. of Phys., Faculty of Sci., Univ. of Granada, Granada, Spain), *Phys. Lett. A (Netherlands)*, vol.94A, no.6-7, p.325-8 (21 March 1983). The dependence of the maximum efficiency of the electrokinetic energy conversion (η_{max}) on the composition of the liquid mixtures can be correlated to changes of the absolute viscosity, the dielectric constant and the specific electric conductance of these mixtures. (12 refs.)

63564 Maximum rate of the cathodic reaction in electroless copper deposition. D.Vitkavage, M.Paunovic (PCK Technol. Div., Kollmorgen Corp., Melville, NY, USA), *Plat. & Surf. Finish. (USA)*, vol.70, no.4, p.48-50 (April 1983).

Conventional electroless solutions deposit copper at the rate of 1 to 5 $\mu\text{m/hr}$ (0.04 to 0.20 mil/hr). But there is a growing interest in high-speed systems with deposition rates above 10 $\mu\text{m/hr}$. The practical limit for the deposition rate of high-speed electroless copper is presently unknown. This paper analyses factors that determine this limit. The approach to this problem is based on the mixed-potential theory of electroless metal deposition. (23 refs.)

(see also 33.50 Fluorescence, phosphorescence; radiationless transitions)

63565 Lifetime uncertainty broadening in photoinduced electron transfer. H.Staerk, R.Treichel, A.Weller (Abteilung Spektroskopie, Max-Planck-Inst. fur Biophys., Gottingen, Germany), *Chem. Phys. Lett. (Netherlands)*, vol.96, no.1, p.28-30 (25 March 1983).

Two types of energy-level broadening, one caused by electron exchange between radicals and ground-state molecules, the other by selective sampling at short times, are investigated. Both lead, in accordance with the uncertainty principle, to an increase in the $B_{1/2}$ value. (11 refs.)

63566 Benzophenone photoreduction by heteroatom-containing donors. J.C.Ronfard-Haret, R.V.Bensasson (Lab. de Biophys., INSERM, Paris, France), *J.C.Gramain*, *Chem. Phys. Lett. (Netherlands)*, vol.96, no.1, p.31-3 (25 March 1983).

Nanosecond flash photolysis has been carried out on benzophenone solutions in benzene and acetonitrile in presence of oxygen- and sulfur-containing reductants such as anisole, thioanisole, dibutyl sulfide and methyl 2-octyl ether. The quantum yield of ketyl formation is compared to previous results on the

quantum yields of the final benzophenone disappearance. This comparison is also related to previous data on benzophenone reduction by nitrogen-containing reductants such as amines and amides and suggests a general mechanism for benzophenone photoreduction by heteroatom-containing donors. (12 refs.)

63567 Reactions induced by ion bombardment of solid cyclohexane at 77K. O.Puglisi, G.Marletta, S.Pignataro (Istituto Dipartimentale di Chimica e Chimica Industriale, Catania, Italy), G.Foti, *Chem. Phys. (Netherlands)*, vol.75, no.3, p.417-23 (15 March 1983). Cyclohexane at 77K has been bombarded with He^+ and Ar^+ at several keV energies. The main chemical products obtained have been identified by GC/MS. The results were compared with those obtained on benzene implantation. The product formations were interpreted in terms of a previously proposed model involving electronic and nuclear stopping mechanisms of the bombarding particles. Some important physicochemical reaction pathways are proposed and discussed. (21 refs.)

63568 Electron spin resonance spectra of tetrafluoroethylene radical cation. A.Hasegawa, M.C.R.Symons (Dept. of Chem., Univ. of Leicester, Leicester, England), *J. Chem. Soc. Faraday Trans. 1 (GB)*, vol.79, no.1, p.93-7 (Jan. 1983).

Exposure of a solid solution of FCCl_3 containing C_2F_4 to γ -rays at 77K gave a species whose ESR spectrum comprised an anisotropic quintet attributed to hyperfine coupling to the four equivalent fluorines of the C_2F_4 radical cation. An extra, small doublet splitting is assigned tentatively to the fluorine of a matrix molecule interacting with the radical cation. INDO calculations show that the radical cation has a planar structure with the unpaired electron in the bonding π orbital, the estimated ^{19}F coupling constants being in good agreement with the experimental data. (13 refs.)

63569 Kinetics of photoprotolytic reaction in coumarin-dye solution. L.D.Derkacheva, A.I.Krymova, V.A.Petukhov, N.S.Platonov, *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.42-4 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.73-8 (July 1982). [received: April 1983]

The kinetics of the radiation from different ionic forms of esculin dye in ethanol with addition of acid is investigated using a high-speed image-converter tube. Radiation intensity scans with subnanosecond resolution are obtained. It is shown that the reaction of joining the proton from the solution can be described by a simple single-step scheme. The photoprotolytic reaction rate constants are calculated from the measured time dependence of the radiation intensity. (6 refs.)

63570 Vacuum ultraviolet as a source for producing intermediates in solid organic matrices. E.Hankiewicz, J.Kroh (Inst. of Appl. Radiation Chem., Tech. Univ., Lodz, Poland), *Radiochem. & Radioanal. Lett. (Switzerland)*, vol.55, no.2, p.87-97 (23 Dec. 1982).

The application of vacuum ultraviolet (VUV) lamps to study the intermediates in polycrystalline (n-hexane and acetone) and glassy (methylcyclohexane and aliphatic alcohols) matrices at 77K is described. The measurements were performed using EPR and radiothermoluminescence techniques. In glassy, VUV irradiated alcohols alkoxy radicals together with hydroxylalkyl radicals were formed. Methanol and ethanol were not ionized with VUV quanta of 10.195 eV energy, but in n-propanol and n-butanol ionic intermediates were observed. The decrease of ionization potential for pure glassy alcohols as compared with gaseous phase has been estimated as at least 0.3 eV. Similar value has been also found for polycrystalline n-hexane. (16 refs.)

63571 The radiation chemistry of nuclear reactor decontaminating reagents. R.M.Sellers (Berkeley Nuclear Labs., CEGB, Berkeley, England), *Radiat. Phys. & Chem. (GB)*, vol.21, no.3, p.295-305 (1983).

Processes involved in the radiation chemistry of some typical nuclear reactor decontaminating reagents including complexing, reducing and oxidising agents are described. It is concluded that radiation-induced decomposition is only likely to be a problem with dilute formulations, and/or with minor additives such as corrosion inhibitors which are not protected from attack by the other constituents. Addition of a 'sacrificial' compound may be necessary to overcome this. The importance of considering loss of function, rather than the decomposition rate of the starting material, is emphasised. Reagents based on low oxidation state metal ions (LOMI) can be regenerated by the radiation field in the presence of formate ion. (31 refs.)

63572 Chemical effects of fission recoils. IV. Temperature distribution in the tracks. J.A.LaVerne, G.G.Meisels (Dept. of Chem., Univ. of Nebraska, Lincoln, NE, USA), *Radiat. Phys. & Chem. (GB)*, vol.21, no.3, p.329-39 (1983).

The temperature in the track of a ^{235}U fission recoil is probed by utilizing the difference in the heats of formation of the isopropyl and normal propyl radicals (3.6 kcal/mol). End products of the reactions of the isomeric propyl radicals are analyzed in the radiolysis of gaseous propane and a mixture of methane, ammonia and propane with γ rays or fission recoils at the same density. The product distribution is independent of density in the γ radiolysis while it varies in the fission recoil radiolysis in a manner suggesting an increase in temperature with density. Kinetic analysis leads to an 'effective' temperature, which is a time average of a localized temperature from the time of particle passage until end product formation. The 'effective temperature' varies approximately linearly with density from ambient at 5 g/L to 40°C above ambient at 100 g/L. This is much lower than the rise calculated by assuming that the track region is heated adiabatically by the entire energy lost by the fission recoil. This is ascribed to diffusive migration of the initially produced species during the physico-chemical stage for a finite relaxation interval. This model suggests a relaxation interval of 2×10^{-10} sec. (44 refs.)

63573 Thermal action of laser radiation on imidization. N.V.Karlov, E.K.Karlova, N.A.Kirichenko, B.S.Luk'yanchuk, O.V.Neklyudova, I.Ya.Ravich, A.N.Sapetskii, T.N.Toroptseva (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR), *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1330-3 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2049-55 (Oct. 1982). [received: April 1983]

Results are presented of experimental and theoretical investigations of an imidization process on exposure to CW CO₂ radiation. It is shown that as a result of the establishment of strong disequilibrium in the system during laser heating, it is possible to achieve higher degrees of imidization than under isothermal conditions and in the presence of infrared photochemical action. (6 refs.)

63574 Spectral dependences of the quantum yields of $I(^2P_{1/2})$ and $I(^2P_{3/2})$ from photolysis of C_3H_7I and CH_3CHICH_3 by vacuum ultraviolet radiation. A.M.Pravilov, S.E.Ryabov (Sci.-Res. Inst. of Phys., A.A. Zhdanov State Univ., Leningrad, USSR).

Sov. J. Quantum Electron. (USA), vol.12, no.10, p.1334-6 (Oct. 1982). Translation of *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2056-60 (Oct. 1982). [received: April 1983]

A method was developed for the determination of the spectral dependences of the quantum yields of photoprocesses resulting from irradiation of the investigated compounds with nonmonochromatic radiation. The spectral dependences of the absolute quantum yields of the formation of $I(^2P_{1/2})$ and $I(^2P_{3/2})$ atoms by photolysis of C_3H_7I and CH_3CHICH_3 were determined in the range 210-155 nm. It was found that practically throughout the investigated range the atoms of iodine were formed mainly in the excited $^2P_{1/2}$ state. (13 refs.)

63575 Methane formation during deuteron bombardment of carbon in the energy range of 100 to 1500 eV. K.Sone. Report CLM-R 236, UKAEA, Culham, Abingdon, Oxon., England (1982), 15 pp.

Available from HMSO, London, England.

Methane (CD_4) formation rates during deuteron bombardment of carbon (Papayex) have been measured in the energy range of 100 to 1500 eV. The temperature dependence of the methane formation rate is well explained by the model proposed by Erents et al. (1978) in the temperature range of 600 to 1150K. The model, however, does not explain the dependence of the methane formation rate on the flux of incident deuterons at a certain temperature near T_m at which the formation rate has a maximum value. An alternative model is proposed in which the methane formation rate is assumed to be proportional to the product of the following three parameters: the surface concentration of deuterium atoms, the chemical reaction rate for the formation of methane, and the rate of production of vacancies on the surface by the deuteron bombardment. This model predicts an energy dependence of methane formation which has a maximum around 900 eV even at different deuteron fluxes, when the calculated result by Weissman and Sigmund (1973) is used for the surface deposited energy responsible for the production of vacancies. 82.50E. Photodissociation, photoionization as studied by luminescence and radiationless transitions

63576 Photofragmentation of CH_3I , CD_3I and CF_3I . Formation of $I(^2P_{1/2})$ as a function of wavelength. T.F.Hunter, S.Lunt (School of Chem. Sci., Univ. of East Anglia, Norwich, England), K.S.Kristjansson. *J. Chem. Soc. Faraday Trans. II (GB)*, vol.79, pt.2, p.303-16 (Feb. 1983). Using several excitation wavelengths in the region from 247.5 to 312.5 nm, the branching ratio $^2P_{1/2}/^2P_{3/2}$ has been established for the iodine atom pro-

duced in the photolysis of CH_3I , CD_3I and CF_3I . An optoacoustic system is used and details of technique and analysis are given. For each molecule three transitions are observed in the $\sigma^* \leftarrow n$ continuum and the position, intensity and bandwidth of each are given. The extent of curve-crossing following the $A_1^* \leftarrow A_1$ transition appears to be approximately the same for all three molecules. (44 refs.)

63577 The influence of polymer concentration on the internal motion—intramolecular pyrene excimer formation—of a low molecular weight probe in solution. M.A.Winnik, A.E.C.Redpath, P.Svirskaya, A.Mar (Dept. of Chem., Univ. of Toronto, Toronto, Ontario, Canada). *Polymer (GB)*, vol.24, no.4, p.473-5 (April 1983).

Fluorescence decay measurements were used to study the kinetics of end-to-end cyclization of the molecule $Py-(CH_2)_5Si(Me_2)OSi(Me_2)(CH_2)_5-Py$ (1), where $Py=1$ -pyrenyl. Experiments were carried out in toluene at 22°C and in cyclohexane at 35°C, in the absence and in the presence of added polystyrene (PS). Addition of even small amounts (0.01 g/ml) of PS caused the cyclization rate of probe molecule 1 to decrease substantially in cyclohexane, whereas in toluene, a much milder retardation of cyclization rate with increasing PS was observed. These effects are interpreted in terms of a coupling between the chain dynamics and that of the probe molecule 1, mediated by the solvent. These hydrodynamic screening interactions depend sensitively upon whether the polymer is in a good or a poor solvent. (11 refs.)

82.55 RADIOCHEMISTRY

63578 Formation of simple ^{14}C -labelled molecules by the nuclear reaction $^{14}N(p,\alpha)^{11}C$ in nitrogen containing solids. K.Rossler, M.Vogt, H.Lattke (KFA, Jülich GmbH, Jülich, Germany). *Radiat. Eff. (GB)*, vol.65, no.1-4, p.117-0 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

Summary form only given, as follows. Simple ^{14}C -labelled molecules which are formed by hot processes following the $^{14}N(p,\alpha)^{11}C$ nuclear reactions with 13 MeV protons in cyclotron targets are of interest as precursors for the synthesis of ^{14}C -radiopharmaceuticals. Solid targets show the advantage of greater stability against radiolysis and heat and a greater variability of chemical reactions. Frozen ammonia NH_3 , ammonium halides NH_4X ($X=F, Cl, Br, I$), and complex salts such as $Co(NH_3)_6Cl_3$ have been studied as matrices. The interaction of recoil carbon atoms with the lattice constituents leads to a very differentiated spectrum of ^{14}C containing compounds. Analysis of the system is performed by gas chromatography or high performance liquid chromatography. In contrast to the situation in alkali halides, the carbon atoms react to organic compounds such as $^{14}C(NH_2)$ -cyanamide, $^{14}CH_3NH_3^+$ -methylammonium, $^{14}CH(NH_2)_2^+$ -formamidine and $^{14}C(NH_2)_3^+$ -guanidine with radiochemical yields of 40%, 80%, 30% and 65%, respectively. Even at 5K, carbon stabilizes via H-abstraction to CN -radicals and insertion into N-H bonds. The amount of ammonium ions interacting with the carbon depends strongly on the lattice arrangement. This could be shown by experiments in different lattice structures, using low temperature cryostats. The above mentioned products can be transferred to ^{14}C labelled compounds such as pyrimidine-derivatives and barbiturates suited for nuclear medical applications. Moreover, the behaviour of carbon impurities in ionic crystals may serve as a model for the formation of organic compounds in inorganic matter. (no refs.)

63579 Hydrocarbon chemistry in irradiated $CO_2/CO/CH_4/H_2O/H_2$ mixtures. I. A survey of the initial reactions. D.J.Norfolk, R.F.Skinner, W.J.Williams (Berkeley Nuclear Labs., CEBG, Berkeley, England). *Radiat. Phys. & Chem. (GB)*, vol.21, no.3, p.307-19 (1983).

A survey is made of the reactions through which low levels of hydrocarbons are radiolysed in $CO_2/CO/CH_4/H_2O/H_2$ mixtures under conditions typical of a gas-cooled nuclear reactor. Species which react with hydrocarbons include clustered positive and possibly negative ions, together at high temperatures with O and H atoms and OH radicals. If all these species are effective the maximum initial rate of attack is $G(-hydrocarbon) \sim 16$. Some of the initial products contain oxygen but alkyl radicals are probably the most important class. (66 refs.)

82.60 CHEMICAL THERMODYNAMICS

(see also 05.70 Thermodynamics)

63580 Thermodynamic study of the valence state of ytterbium in $YbAl_2$ and $YbAl_3$ compounds. A.Pasturel, C.Chatillon-Colinet (Lab. de Thermodynamique et Physicochimie Metall., Ecole Nat. Supérieure d'Electrochimie et d'Electrometall., de Grenoble, Saint Martin d'Heres, France), A.Percheron-Guegan, J.C.Achard. *J. Less-Common Met. (Switzerland)*, vol.90, no.1, p.21-7 (March 1983).

The heats of dissolution of rare earth metals in liquid aluminium and the enthalpies of formation of $YbAl_2$ and $YbAl_3$ were measured by a calorimetric method. In the metallic state ytterbium is divalent, whereas in alloys it can become trivalent like the majority of the rare earth metals. The results of this experimental study show that the energy difference between divalent and trivalent ytterbium is 7 kcal (g atom) $^{-1}$. The enthalpies of formation of $YbAl_2$ and $YbAl_3$ are -26.1 kcal mol $^{-1}$ and -31.1 kcal mol $^{-1}$ respectively. The valence of ytterbium in these compounds was studied using Miedema's model (1977). (16 refs.)

63581 Enthalpies of formation of liquid and solid binary alloys based on 3d metals. III. Alloys of iron. R.Boom (Res. Labs., Hoogovens IJmuiden, IJmuiden, Netherlands), F.R.de Boer, A.K.Niessen, A.R.Miedema. *Physica B & C (Netherlands)*, vol.115 B+C, no.3, p.285-309 (March 1983). For pt.II see ibid., vol.113B, p.18 (1982). Model predictions are presented for heats of formation of intermetallic compounds of iron with arbitrary metal partners. For the corresponding liquid alloy systems heats of mixing and solution are predicted. Calculation enthalpies are compared with experimental data as well as with the qualitative information that can be derived from phase diagrams. The available binary iron-based phase diagrams are presented in schematic form. A general discussion of the alloying behaviour of iron is given and practical applications of the generated enthalpy data are indicated. (186 refs.)

82.65 SURFACE PROCESSES

- 63582** Microwave absorption studies of interface phenomena at ZnO electrodes. R.A.Bogomolnii, H.Tributsch, G.Petermann, M.P.Klein (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA). *J. Chem. Phys. (USA)*, vol.78, no.5, p.2579-84 (1 March 1983).
 In order to explore the feasibility of microwave absorption techniques as a tool for the study of interfaces and electrode reactions, the authors have measured the electrochemical and photochemical properties of ZnO in contact with an aqueous electrolyte by conventional electrochemical procedures and simultaneously by electrodeless detection of microwave absorption at 9.5 GHz in a resonant cavity. Pronounced potential dependent microwave absorption signals were found which proved to be influenced by illumination and electrochemical surface reactions. The comparison of microwave absorption with the electrochemically measured electrode behavior indicates that microwave absorption data can provide interesting complementary information on the nature and reactivity of charge carriers and dipoles in the electrode/electrolyte interface. The proposed method is so sensitive that signals arising from fractions of monolayers will be detectable. A comprehensive interpretation of the results is not yet attempted. Further experimental studies on simple electrode systems are needed to clarify the mechanism. Because of its nondestructive nature, the microwave method could develop into a valuable new technique in surface chemistry. (8 refs.)
- 63583** The effect of the surface state on the hydrogen permeability and the catalytic activity of palladium alloy membranes. N.R.Roshan, A.P.Mishchenko, V.P.Polyakova, N.I.Parenova, E.M.Savitsky, E.A.Voitikhova, V.M.Gryaznov, M.E.Sarylova (A.A. Baikov Inst. of Metall., Acad. of Sci., Moscow, USSR). *J. Less-Common Met. (Switzerland)*, vol.89, no.2, p.423-8 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Tobu, Japan, 30 May-4 June 1982).
 The surface state of an active membrane has a marked effect on its hydrogen permeability and catalytic activity in reactions involving the addition or subtraction of hydrogen. Interactions of organic compounds, oxygen and hydrogen on membrane catalysts produce changes in their surface composition and structure such that the rates of catalytic reactions and hydrogen transfer are altered and carbon migrates into the membrane bulk. Polishing and chemical cleaning of the membrane surface increases the rate of hydrogen transfer through the membrane. Membranes with a porous surface display catalytic activity and hydrogen permeability which are an order of magnitude higher than those of the initial foils. (8 refs.)
- 63584** Effect of the hydrogen concentration on the adsorption and catalytic properties of a Pd-Ru alloy. V.G.Dobrokhotoy, V.M.Gryaznov (A.V. Topchiev Inst. of Petrochem. Synthesis, Moscow, USSR), L.F.Pavlova. *J. Less-Common Met. (Switzerland)*, vol.89, no.2, p.585-6 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Tobu, Japan, 30 May-4 June 1982).
 An increase in the hydrogen concentration in the Pd-Ru alloy increases the adsorption of cyclohexane on the hydrogen-poor α phase and decreases it on the hydrogen-rich β phase. The kinetics of the hydrogenation of benzene to cyclohexane on the α and β phases are different. These phenomena indicate that the adsorbed hydrogen interacts with the hydrocarbon species. (no refs.)
- 63585** Hot atoms and cold facts: mysteries and opportunities in vibration-assisted surface chemistry. C.B.Duke (Xerox Webster Res. Center, Rochester, NY, USA). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.29, p.1-9 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).
 This paper is a synopsis of the keynote lecture at the Third International Conference on Vibrations at Surfaces. The science of hot atoms at surfaces is divided into three broad areas: spectroscopy, theory, and process dynamics. A brief overview of each area is given in which the main advances and mysteries which have emerged during the past few years are noted. The resolution of such mysteries provides the traditional type of opportunity for scientific discovery. Most of the currently visible frontiers lie in the development of applications of the techniques of vibrational spectroscopy, however, so that these scientific opportunities tend to be different in kind than they were a decade ago. Another type of opportunity is the development of hot-atom process technologies. Inspection of current activity reveals that a gap exists between the development of the techniques of vibrational spectroscopy as applied to well-defined model systems and the systematic application of these techniques to examine and extend process technologies based on surface chemistry. Radiation-induced surface chemistry is an example of an area which affords a unique opportunity for surface vibrational spectroscopy and theoretical chemistry to play a significant role in the development of fabrication technologies for electronic devices. This type of opportunity is shown to be particularly important for the future of surface vibrational spectroscopy in the current economic climate for research and development. (86 refs.)
- 63586** Combined vibrational/temperature programmed reaction spectroscopy studies of reaction intermediates on metal surfaces. R.J.Madix (Dept. of Chem. Engng., Stanford Univ., Stanford, CA, USA). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.29, p.25-34 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).
 In many cases temperature programmed reaction spectroscopy (TPRS) and surface vibrational spectroscopy can be effectively combined to yield the

details about the mechanism of surface reactions. When reaction products are evolved from the surface in reaction-limited steps, TPRS is often sufficient to identify the stable reaction intermediates. On the other hand, if product evolution is desorption-limited, vibrational spectroscopy, as well as XPS or UPS, is indispensable for identification of reaction intermediates. In some cases, the two methods complement one another, and both the identity of the intermediate and its orientation can be defined. Examples of the combined use of these techniques are given. Reactions of formic acid and methanol on metal surfaces are discussed. The dehydrogenation of formic acid on Ni (110) forms coadsorbed CO and formate intermediates, leading to abnormal decomposition kinetics of the formate due to lateral interactions. (29 refs.)

63587 Infrared laser stimulated surface processes. T.J.Chuang (IBM Res. Lab., San Jose, CA, USA). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.29, p.125-38 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).
 Gas-surface interactions including the process of chemisorption, the reaction involving the adsorbate and the adsorbent, the formation of reaction products and the desorption of adsorbed species enhanced by infrared laser radiation have been investigated. Specifically, SF_6 and SiF_4 interactions with silicon affected by CO₂ laser pulses, and the infrared photon stimulated desorption of C_2H_5N and C_2D_5N molecules from KCl, Ag (110) and Ag island films have been studied to illustrate the many facets of the vibrationally activated surface processes. Aspects related to surface reaction dynamics and molecular selectivity in photodesorption are discussed. (64 refs.)

63588 The adsorption and dehydrogenation of cyclopentane on Ru (001). F.M.Hoffmann (Exxon Corporate Res., Linden, NJ, USA), E.V.O'Brien, J.Hrbek, R.A.De Paola. *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.29, p.301-5 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).
 The adsorption of cyclopentane on Ru (001) has been studied using electron energy loss spectroscopy (EELS) and thermal desorption mass spectroscopy (TDMS). Thermal desorption shows with increasing coverage a chemisorbed first layer desorbing at 180 K with subsequent multilayer formation. The vibrational spectrum of the first chemisorbed layer is characterized by a C-H soft mode at 2610 cm^{-1} . This mode is ascribed to a C-H-metal interaction, which is also responsible for the dehydrogenation to cyclopentene upon annealing to 200 K. It appears that a close geometrical fit between the entire molecule and the metal substrate is not necessary for this type of interaction. Coadsorbed oxygen suppresses the C-H-metal interaction. This is believed to be due to site-blocking or ligand effects of oxygen on the three-fold hollow sites of Ru (001). (10 refs.)

63589 Thermal evolution of C_2H_2 and C_2H_4 on Pd (111) studied by high-resolution electron energy loss spectroscopy. L.L.Kesmodel, J.A.Gates (Phys. Dept., Indiana Univ., Bloomington, IN, USA). *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.29, p.307-12 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).
 The thermal evolution of acetylene and ethylene on a palladium (111) surface has been studied by high-resolution electron energy loss spectroscopy in the temperature range 150K-500K. Formation of ethylidyne ($\equiv C-CH_3$) near room temperature is important for both molecules, whereas CH is the major surface hydrocarbon species formed at high temperatures. (12 refs.)

63590 Electron energy loss spectroscopy of the decomposition of formic acid on Ru (001). B.H.Toby (Div. of Chem. & Chem. Engng., California Inst. of Technol., Pasadena, CA, USA), N.R.Avery, A.B.Anton, W.H.Weinberg. *J. Electron Spectrosc. & Relat. Phenom. (Netherlands)*, vol.29, p.317-21 (15 Jan. 1983). (Proceedings of the Third International Conference on 'Vibrations at Surfaces', Asilomar, CA, USA, 1-4 Sept. 1982).
 Electron energy loss spectroscopy has demonstrated the existence of both a monodentate and a symmetric bidentate bridging formate as stable intermediates in the decomposition of formic acid on the Ru (001) surface. The monodentate formate converts upon heating to the bidentate formate which decomposes via two pathways: C-H bond cleavage to yield CO₂ and adsorbed hydrogen; and C-O bond cleavage to yield adsorbed hydrogen, oxygen and CO. Thermal desorption spectra demonstrate the evolution of H₂, H₂O, CO and CO₂ as gaseous products of the decomposition reaction. The observation of this product distribution from Ru (100), Ni (100) and Ni (110) had prompted the proposal of a formic anhydride intermediate, the existence of which is rendered questionable by the spectroscopic results reported. (16 refs.)

63591 Studies of the surface of titanium dioxide. V. Thermal desorption of hydrogen. T.Iwaki (Faculty of Sci., Hiroshima Univ., Hiroshima, Japan). *J. Chem. Soc. Faraday Trans. 1 (GB)*, vol.79, no.1, p.137-46 (Jan. 1983).
 The thermal desorption of hydrogen adsorbed on titanium dioxide has been studied at temperatures between 298 and 1073K by two techniques: (i) temperature-programmed desorption (TPD), and (ii) measuring the hydrogen content. Chemisorption of hydrogen on titanium dioxide took place only when hydrogen was introduced above 623K. The onset of hydrogen desorption occurred at 523K on anatase and 573K on rutile. Anatase gave two H₂ desorption peaks while rutile gave a single broad peak. The hydrogen content on anatase was much larger than that on rutile. On the basis of these results the interaction of hydrogen with titanium dioxide is discussed in connection with the formation of surface hydroxy groups. (28 refs.)

63592 Investigation of precipitated alumina structures by secondary-ion mass spectrometry and electron paramagnetic resonance spectroscopy. III. Structure of an alumina coating precipitated on rutile titanium dioxide. A.S.Hare, J.C.Vickerman (Dept. of Chem., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England). *J. Chem. Soc. Faraday Trans. 1 (GB)*, vol.79, no.1, p.185-93 (Jan. 1983).
 For Pt.II see ibid., vol.77, p.1113 (1981). Deposition of an alumina or alumina-silica coating upon a rutile substrate was achieved satisfactorily in an aqueous precipitation system, which may contain paramagnetic ions coprecipitated at trace levels. Secondary-ion mass spectra of powders extracted during the process are consistent with an independent coating mechanism, i.e. nucleation and growth of the coating occurred at the surface of the rutile particles. The depth distribution of alumina, estimated from secondary-ion mass spectroscopy and etching measurements in the ultimate product, has been confirmed by transmission electron microscopy. Chromium(3+) tracer electron paramagnetic resonance spectra suggest that pseudo-boehmitic sheet growth is well developed in the alumina coating component, even without ageing. (12 refs.)

63593 Infrared study of three butanediols adsorbed on silica immersed in carbon tetrachloride. W. Neagle, C.H. Rochester (Chem. Dept., Univ. of Dundee, Dundee, Scotland).

J. Chem. Soc. Faraday Trans. 1 (GB), vol.79, no.1, p.263-8 (Jan. 1983). Infrared spectra are reported of silica immersed in solutions of butan-2,3-diol, butan-1,3-diol and butan-1,4-diol in carbon tetrachloride. Associative adsorption involved the formation of hydrogen bonds between isolated surface silanol groups and either one or both hydroxy groups in each adsorbed molecule. Increasing the separation of the two hydroxy groups in the series of three diols enhanced the proportion of adsorbed molecules for which both groups interacted with the surface. Multilayer adsorption occurred at high concentrations of the diols in solution. (12 refs.)

63594 The γ irradiation-enhanced corrosion of stainless and mild steels by water in the presence of air, argon and hydrogen. W.G. Burns, W.R. Marsh, W.S. Walters (Chem. Div., AERE, Harwell, England).

Radiat. Phys. & Chem. (GB), vol.21, no.3, p.259-79 (1983). When air-saturated pure water was γ -irradiated in the presence of air to high doses (10^2 - 10^3 Mrad) in sealed stainless steel containers hydrogen and oxygen were formed. The amounts were less than one tenth of the maximum possible for continuous aqueous radiolysis but the increase in oxygen appearing as gas was less than that equivalent to the hydrogen formed from the water present, indicating that metallic corrosion had occurred. In the absence of radiation no change in gas composition was observed. When the air in solution and in the gas space was replaced by argon or by hydrogen, radiolysis and corrosion were virtually suppressed. When the container was made of mild steel or strips of mild steel were initially introduced into a sealed stainless steel container containing air and water, oxygen was consumed on irradiation, and hydrogen was formed, together with a suspended brown oxide. In the absence of radiation oxygen was consumed and hydrogen was formed but both at a lower rate than in the presence of radiation. In this case, unlike the case of stainless steel, the formation of hydrogen was not prevented by replacing the air present with argon. The rate of product formation from either system in the presence of air was found to be proportional to dose-rate, in the range 0.2 - 2 Mrad h^{-1} and mass changes of the solids, when measurable, corresponded to the oxygen deficit in the gas phase if the oxide was taken to be Fe_2O_3 . The effects are greater than hitherto reported. These results are interpreted on the basis of the surface reactions of transient radiolytic products, and product formation is analysed mathematically in terms of a multispecies reaction scheme (33 reactions) involving diffusion to the surface. (22 refs.)

63595 The effect of radiation on the release of corrosion products from 304 stainless steel in high temperature water-II effects of flow rate and duration of corrosion experiment. K. Ishiguro, H. Ikuse, K. Oshima (Dept. of Nuclear Engng., Univ. of Tokyo, Tokyo, Japan), N. Fujita, S. Ono.

Radiat. Phys. & Chem. (GB), vol.21, no.3, p.281-7 (1983).

The effect of γ -radiation on the release of corrosion products from 304 stainless steel was investigated using a small circulation loop at high temperature. It was found the flow rate has a significant effect on the release rate and the release behavior is quite different after long duration of the corrosion experiments from that at early stage. (9 refs.)

63596 The Balloon effect. A quantum chemical model of elementary steps in heterogeneous chemical reactions between simple gases and solid surfaces. H. Muller, C. Opitz (Sektion Chemie, Friedrich-Schiller Univ., Jena, Germany).

Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.31, no.6, p.885-93 (1982). In German.

Due to lack of knowledge of microscopic reaction steps for many solid reactions the authors describe the chemical attack of simple molecules (A) on single crystal surfaces (FKO) of different solids and discuss, in particular, the activation of the solid caused by the chemisorbed particle (A_{ads}), which results in formation of a surface complex (P_{ads}) by weakening all bonds between the attacked lattice point and the crystal whereby desorption (demetalization) of P_{ads} easily becomes possible ($\rightarrow P_{\text{gas}}$). This mechanism is called the Balloon effect. A number of applications are discussed and a more sophisticated version of this Balloon effect is presented. (9 refs.)

63597 Complex analysis of experimental adsorption data using KRS 4200 and ES 1040 computers. P. Brauer, K.-H. Henneberg, P. Hofer (Friedrich Schiller Univ., Jena, Germany).

Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.31, no.6, p.1001-5 (1982). In German.

The topics of computer programmes for analysis of adsorption isotherms are described. The programmes allow the phenomenological treatment of isotherms, the evaluation of surface and solid structure parameters and the calculation of adsorption energy distribution functions. (17 refs.)

63598 Thermodynamic values evaluation from adsorption isotherms using KRS 4200 computer. P. Brauer (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany).

Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.31, no.6, p.1007-16 (1982). In German.

The equations to calculate thermodynamical values of adsorption of gases and vapours on solid surfaces are derived using the usual thermodynamical approach. To evaluate these adsorption values from adsorption isotherms a programme for the computer KRS 4200 is developed and described. This programme is tested by means of a model adsorption system. (13 refs.)

63599 Adsorption and reactive changes of octadecylamine on iron oxide surfaces. H. Hobert, K. Klostermann, H. Wachtel, I. Weber (Friedrich Schiller Univ., Jena, Germany).

Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.31, no.6, p.1059-63 (1982). In German.

The adsorption of octadecylamine from an aqueous-acetic acid solution gives a saturation concentration on the oxides, which corresponds to two monolayers in the case of Fe_2O_3 but to only one monolayer in the case of Fe_3O_4 . The interaction between octadecylamine and the iron oxides is connected with deamination and oxidation reactions. These reactions give di- and tri-octadecylamine and amid-like oxidation products. 82.70 DISPERSE SYSTEMS

(for flow behaviour, see 47.55K)

63600 Structure of a microemulsion in the critical region: neutron small-angle scattering results. J. Tabony, M. Drifford, A. de Geyer (Dept. de Phys.-Chimie, CENS, Gif-sur-Yvette, France).

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.119-25 (25 March 1983). Neutron small-angle scattering has been used to study the structure of an oil in water microemulsion in the critical region. The structure, one of small 'swollen' micelles, is independent of the critical fluctuations. This together

with other evidence strongly suggests that the latter are clusters of swollen micelles. (15 refs.)

63601 Apparatus for examining the sedimentation stability of a filled polymer [using laser radiation]. N.I.Duvankov, A.V.Vasin, M.A.Fioshina (Mendeleev Inst. of Chem. Technol., Moscow, USSR). *Ind. Lab. (USA)*, vol.48, no.6, p.594-6 (June 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.6, p.58-9 (June 1982). [received: March 1983]
The authors describe an apparatus for examining the stability of filled polymer compositions. The principle is automatic recording of the intensity of the radiation from a laser passing through the specimen in different layers during the mass-transport process. The beam is moved over the specimen in the cell by the reciprocating motion of a refracting prism. The apparatus enables one to measure the characteristics of filled polymers over wide ranges in temperature and degree of filling (0-80% by volume). (13 refs.)

63602 The multistate kinetics of nucleation in the presence of an aerosol. R.McGraw, W.H.Marlow (Dept. of Energy & Environment, Brookhaven Nat. Lab., Upton, NY, USA). *J. Chem. Phys. (USA)*, vol.78, no.5, p.2542-8 (1 March 1983).
The classical Becker-Döring homogeneous nucleation theory is rigorously extended to include monomer and cluster removal mechanisms capable of coupling to the usual Becker-Döring equations for evaporation and growth. Exact expressions are obtained in a compact continued fraction form for the steady state cluster distribution and nucleation rate in the presence of an aerosol. The unmodified classical theory is recovered in the limit of a particle free vapor. Recently proposed models for new particle formation in the presence of an aerosol and nucleation in a nonuniform vapor are shown to be contained within the present formulation. Condensation curves are calculated for a series of model condensable vapor species covering a wide volatility range in the presence of an aerosol. For those vapors having low equilibrium vapor pressures (less than 10^{-5} Torr at the highest aerosol concentrations considered) significant departures from predictions based on the unmodified classical theory are found. (15 refs.)

63603 Segmental motion of alkyl chains grafted on silica gel, studied by neutron scattering. J.P.Beaufils (Inst. Laue-Langevin, Grenoble, France), M.C.Hennion, R.Rosset. *J. Phys. (France)*, vol.44, no.4, p.497-503 (April 1983).
The quasielastic neutron scattering spectra of $C_{12}H_{25}$ grafted on silica are obtained for $n=4, 8, 12, 16, 18, 22$. The well known difficulty in determining the mass in the beam is overcome by using (as a reference) the integrated elastic and quasielastic scattering function, extrapolated to $q=0$. A correction for the coherent scattering contribution is applied. It is thus possible to determine the molar scattering functions of the chains $S_q(q, \omega)$. Assuming that in all chains there is a constant number n_c of end atoms contributing S_m to S_q , the authors obtain $S_m = S_c + (n - n_c) S_m$. This relationship is verified for the elastic incoherent structure factor and used to calculate S_m . The $n=22$ case is left apart, its anomalous behaviour is explained by interaction between neighbouring chains. The data agree with a 3-bonds jump model with a time between jumps equal to 1.9×10^{-11} s at room temperature. (10 refs.)

63604 Adsorption on heterogeneous surfaces. IX. Evaluation of adsorption energy distribution functions from nitrogen adsorption isotherms on modified aerosols using different numerical methods. P.Brauer, W.A.House, M.Jaronec (Friedrich Schiller Univ., Jena, Germany). *Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.987-100 (1982). In German.
The adsorption energy distribution functions have been evaluated from nitrogen adsorption data measured on four chemically modified aerosols at 78K. A comparison is made of the distribution functions derived using four different approximate methods and three different exact methods. Although the distributions differ in particular details, the main surface features for a given adsorption system are clearly evident. The more exact distribution functions are found with the HILDA algorithm. A chemical interpretation of the peaks in the HILDA adsorption energy distributions is suggested. (46 refs.)

63605 The interaction of acetone and acetonitrile with surface centres of disperse silica. P.Fink, I.Plötzki, P.Brauer (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany). *Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.1031-8 (1982). In German.
The adsorption of acetonitrile and acetone on aerosol samples with different concentration and arrangement of OH groups and modified with trimethylsilyl, BOH and POH groups was investigated by infrared spectroscopy. With the help of acetone and acetonitrile as indicator molecules it is possible to distinguish clearly between the different surface centres. Acetone were able to form 1:2 complexes, acetonitrile only 1:1 complexes with OH groups. A specific interaction was observed between trimethylsilyl groups and acetone and acetonitrile respectively. The adsorption is in a small extent irreversible in the case of acetonitrile on aerosil and of acetone on boric acid modified aerosil. (7 refs.)

63606 Investigations of the adsorption behaviour of aliphatic amines on a silica gel surface. R.Toepel, W.Vogelsberger, G.Rudakoff (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany). *Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.1045-52 (1982). In German.
Results about the adsorption of n-propylamine, n-butylamine and triethylamine on both hydrated and dehydrated silica gel surfaces are presented. An interaction between the amine and the free surface hydroxyl groups is found by IR-spectroscopy. This hydrogen bond complex is destroyed in vacuum. Only in the case of n-propylamine the formation of an ionic structure $R-NH_3^+$ on the surface is observed. The formation of the adsorbate complexes depends on the heat treatment of the silica gel, but also on the chain length and the structure of the organic residues present in the amines. (14 refs.)

63607 IR spectroscopic investigations on the adsorption of propionic acid and N,N-dimethylformamide on SiO_2 and Al_2O_3 from the liquid phase. M.Meyer (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany). *Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.1053-8 (1982). In German.
The adsorption of propionic acid and N,N-dimethylformamide on SiO_2 and Al_2O_3 from CCl_4 -solution was investigated in situ in a new developed IR cell. During the absorption on SiO_2 the interaction mainly took place about the formation of hydrogen bonds between surface silanol groups and the adsorptives. Propionic acid was chemisorbed on Al_2O_3 as carboxylate which is stable on the surface at 673K. The adsorption of N,N-dimethylformamide on Al_2O_3 led like on SiO_2 to an interaction about hydrogen bonds. After heat treatment at 673K on the Al_2O_3 -surface very stable formate ($HCOO^-$) structures were formed. (5 refs.)

63608 IR spectroscopic investigation of carboxylic acid salts of alkalis and thallium in nonpolar solvents. D.D.Thuc, G.Rudakoff. *Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany)*, vol.31, no.6, p.1099-106 (1982). In German.
Solutions of salts of higher fatty acids in nonpolar solvents have been investigated by IR-spectroscopy. Depending on temperature, the solutions contain micelles, double molecules and ions. Addition of free fatty acids leads to a decay of micelles. During warm-up, the solvents used become air-oxidized. In the reaction soaps act as catalysts. (8 refs.)

82.80 CHEMICAL ANALYSIS AND RELATED PHYSICAL METHODS OF ANALYSIS

63609 LAMMA—a new approach for the application of lasers in the analysis of bulk material. H.Vogt, H.-J.Heinen, S.Meier (Leybold-Heraeus GmbH, Köln, Germany). *Laser & Optoelektron. (Germany)*, vol.15, no.1, p.23-9 (March 1983). In German.

The analytical potential of mass spectrometry is largely widened if microscopically small areas of a solid sample can selectively be analyzed. Lasers are very advantageous for ion generation from micro areas of the sample. Some basic aspects for the technical realization of a laser microprobe are discussed. The fields of application are demonstrated with a few selected examples. (5 refs.)

63610 Computerised spectrochemical analysis. E.Jagannatham (Mafatal Engineering Industries Ltd., Thane, India). *Electr. India*, vol.22, no.21, p.23-8 (15 Nov. 1982). [received: March 1983]
High speed computerised accuracy in the determination of elemental composition of metals and alloys is a requirement in steel mills, ferrous and non-ferrous foundries and quality control laboratories of metal users and transportation centres. Computerisation of spectrochemical analysis has become necessary and offers abundant facilities to the user. Here emphasis is laid on computerisation without going into the details of the spectrometer itself. However, principles of optical emission spectrometry are dealt with in order to understand the steps of computer operation during analysis. (no refs.)

63611 Elemental analysis performed with the Karlsruhe nuclear microprobe. D.Heck, E.Rokita (Kernforschungszentrum Karlsruhe GmbH, Inst. für Anewandte Kernphys., Karlsruhe, Germany). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1220-3 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
Proton induced X-rays have been used in the Karlsruhe nuclear microprobe to determine the content of some trace elements in normal and cancerously degenerated human stomach mucosa tissue. A 3 MeV proton beam produced in a single stage Van de Graaff accelerator is focussed down to 3 μm at 600 pA and swept across the specimens in a meandrous pattern. The local mass density of the specimens is determined by the yield of elastically scattered protons, which are registered in a surface barrier detector. Erythrocytes served as test objects to demonstrate the feasibility of the procedure. Specimens of stomach mucosa were prepared by two different methods of fixation. After irradiation the specimens were stained to identify the histological structure. All specimens show rather low structure in elemental concentrations except for iron. No significant shifts in the trace element contents between normal and cancerous stomach mucosa could be observed. (13 refs.)

63612 Chemical history with a nuclear microprobe. C.J.Maggiore, T.M.Benjamin, P.J.Hyde, P.S.Z.Rogers, S.Srinivasan, J.Tesmer (Los Alamos Nat. Lab., Los Alamos, NM, USA), D.S.Woolum, D.S.Burnett. *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1224-7 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
A nuclear microprobe cannot give direct information on the chemical state of an element, but the spatial distribution of elements in a specimen is often determined by the chemical history of the sample. Fuel cells and minerals are examples of complex systems whose elemental distributions are determined by past chemical history. The distribution of catalyst in used fuel cell electrodes provides direct information on the chemical stability of dispersed catalysts under operating conditions. The authors have used spatially resolved Rutherford backscattering to measure the migration of platinum and vanadium from intermetallic catalysts and to determine their suitability for use under the extreme operating conditions found in phosphoric acid fuel cells. Geologic materials are complex, heterogeneous samples with small mineral grains. The trace element distribution within the individual mineral grains and between different mineral phases is sensitive to the details of the mineral formation and history. The spatial resolution and sub-100-ppm sensitivity available with a nuclear microprobe open up several new classes of experiments to the geochemist. Geochemistry and electrochemistry are two areas proving particularly fruitful for application of the nuclear microprobe. (1 ref.)

63613 Helium microprobe analysis of semiconductor materials. J.C.McCallum, C.D.McKenzie (School of Phys., Univ. of Melbourne, Parkville, Victoria, Australia). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1228-31 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).
The Melbourne University nuclear microprobe is described. Recent improvements have enabled beam spot sizes of 1 μm to be obtained. Some applications of the probe to the analysis of semiconductor materials are discussed, in particular the use and map display of channelling over microscopic areas. (14 refs.)

63614 The analysis of fly ash particles with a proton microbeam. R.D.Vis, A.J.J.Bos, V.Valkovic, H.Verheul (Free Univ., Amsterdam, Netherlands).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1236-9 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

The use of a proton microbeam for the study of concentration profiles for different elements in single ash particles is reported. (18 refs.)

63615 Trace element mapping of biological tissues using PIXE and XRF. M.Prins, J.A. Van der Hiede (Eindhoven Univ. of Technol., Eindhoven, Netherlands), A.J.Bos, K.Bowen, S.Davies.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1243-5 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

For the measurement of the distributions of trace elements concentrations in biological samples the PIXE technique as well as the fluorescence of synchrotron radiation can be applied. At the Eindhoven University of Technology and the Free University of Amsterdam a PIXE microbeam facility has been used for analysis in a scanning mode of biological tissues. At the Synchrotron Radiation Source in Daresbury UK an XRF station for several mm beam sizes, equipped with a graphite mosaic crystal as a monochromator has been built. An X-ray microbeam facility with a silicon concave mirror as a focussing device is in Daresbury under construction. Due to the specific machine features synchrotron radiation is favourite for the analysis of lighter elements with atom number $9 < Z < 25$, while PIXE is more useful for the $K\alpha$ radiation of heavier elements. (6 refs.)

63616 Measurements of trace element concentration profiles across the diameter of human hair with micro-PIXE. A.J.J.Bos, C.C.A.H.Stap, W.J.M.Lenglet, R.D.Vis, V.Valkovic (Natuurkundig Lab., Vrije Univ., Amsterdam, Netherlands).

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1249-51 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Trace element distributions across single human hairs using a proton microbeam has been measured to study the origin of these elements in hair. A new way of concentration assignment for micro PIXE making use of both the Proton Induced characteristic X-rays and the Rutherford Backscattered protons is reported. (8 refs.)

63617 Surface spectroscopy using high energy heavy ions. B.L.Doyle, P.S.Peeray (Sandia Nat. Labs., Albuquerque, NM, USA), T.J.Gray, C.L.Cooke, E.Justiniano.

IEEE Trans. Nucl. Sci. (USA), vol.ns-30, no.2, p.1252-4 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982).

Surface atoms ionized by high energy heavy ions have been detected by time-of-flight and quadrupole mass spectroscopic techniques. The experimental arrangements are described and potential applications are suggested. Both techniques are demonstrated to produce significant improvements in the detection of atomic hydrogen, with the TOF method producing a nine order of magnitude increase in the sensitivity of atomic hydrogen compared to standard nuclear analysis methods. (14 refs.)

63618 Quantitative X-ray phase analysis of R-Co alloys. V.A.Lyubushkin, L.M.Lyubushkina, I.D.Vetoshkin (Irkutsk State Teacher Training Inst., USSR).

Ind. Lab. (USSR), vol.48, no.6, p.578-80 (June 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.6, p.46-8 (June 1982). [received: March 1983]

The authors test the method of quantitative X-ray phase analysis of R-Co alloys using two-phase ($\text{RCO}_2\text{-R}_2\text{Co}_{17}$) alloys of Sm-Co and Pr-Co with known compositions and concentrations. The results are found to be in good agreement with metallographic and magnetic analyses. (3 refs.)

63619 Statistical analysis of the error of concentration measurements using an electron-probe microanalyzer. L.I.Erokhin, B.K.Akimov (Tula Polytech. Inst., Tula, USSR).

Ind. Lab. (USSR), vol.48, no.6, p.584-6 (June 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.6, p.50-2 (June 1982). [received: March 1983] (5 refs.)

63620 Installation for preparing samples for radioisotope-excited X-ray fluorescence analysis. V.A.Belyakov, V.I.Luk'yanova, G.A.Ivanyukovich (Sadon Lead-Zinc Combine, USSR).

Ind. Lab. (USSR), vol.48, no.6, p.623-5 (June 1982). Translation of: *Zavod. Lab. (USSR)*, vol.48, no.6, p.90-1 (June 1982). [received: March 1983]

The authors devised an installation for preparing samples incorporating vacuum filtering which is used in a system of radioisotope-excited X-ray fluorescence analysis in the inspection of the composition of ore concentrates, classifier discharge, and tailings. The installation is a rotating drum in which three vacuum filters are mounted; these are at the same time cassettes for samples. The installation has the following additional equipment: electric motor, sample cutoff with slurry conduit, funnel for washing off filter cake, settling tank connected to the vacuum system of the plant, and protective jacket. (1 ref.)

63621 Determining the saturated-vapor pressure of lead by the total-absorption method. V.G.Muradov, Yu.N.Kudryavtsev, O.N.Muradova.

J. Appl. Spectrosc. (USSR), vol.36, no.5, p.481-4 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.709-12 (May 1982). [received: Feb. 1983]

Using the basic resonance line PbI 283.3 nm the authors present the results of determining the partial pressure of lead atoms (p_{Pb}) by the total-absorption method. (7 refs.)

63622 Methods of spectral analysis with laser selection of the sample and its vaporization in arc discharges. M.L.Petukh, V.D.Satsunkevich, A.A.Yankovskii.

J. Appl. Spectrosc. (USSR), vol.36, no.5, p.485-8 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.712-17 (May 1982). [received: Feb. 1983]

Laser spectral analysis is often undertaken with devices in which the analytical sample is simultaneously acted upon by both laser radiation and electrical discharges. When focused laser radiation acts on the sample, scattering of the sample occurs, with the formation of a plasma cloud. In an electrical discharge induced by a laser plasma, additional vaporization of the sample occurs, together with the excitation of its spectrum. In the Korall-1 device used by the authors and intended for spectral analysis with laser selection of the sample, no synchronization of the laser and electrical pulses is required. In consequence, the analysis may be performed by methods of simultaneous, sequential, and separate selection and vaporization of the sample. The authors investigate and describe these methods. (9 refs.)

63623 System for identification of individual components in mixtures on the basis of Shpol'skii spectra. M.M.Pugovkin, G.A.Oik'khovik, O.N.Vylegzhanin.

J. Appl. Spectrosc. (USSR), vol.36, no.5, p.536-9 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.766-70 (May 1982). [received: Feb. 1983]

Describes a program system for working up quasi-line spectra of complex mixtures with the aim of identifying individual compounds in the mixtures. The system consists of a bank of spectra of 100 aromatic and heterocyclic compounds that are given in the atlas, plus a search and identification program. The bank of reference spectra is organized in the form of a sequential-access file on a magnetic disk. The record corresponding to one particular reference spectrum contains codes of the following data: index number of the document, index number of the substance in the catalog, empirical formula and name of compound, type of spectrum fluorescence or phosphorescence, excitation wavelength, type of instrument, and type of solvent. All these codes can serve as keywords, and the search program with respect to the proposed question selects the spectra in the catalog on the basis of any of these keys and also on the basis of any combination of keys. The file of reference spectra consists of 975 recordings of variable length, and it contains the complete set of radiation lines of the spectra without any accounting for their intensities. (7 refs.)

63624 X-ray microanalysis of nitrogen in presence of titanium with an automated electron microprobe. A.Armigliato, L.Dori, A.Garulli, P.Venturi (Istituto Lamel, CNR, Bologna, Italy).

J. Microsc. & Spectrosc. Electron. (France), vol.7, no.6, p.593-603 (Dec. 1982).

The X-ray analysis of nitrogen is particularly difficult when titanium is also present in the specimen to be analyzed; due to the well known interference between the $\text{N}K\alpha$ and the $\text{Ti}L$ lines. A few methods of subtraction of the $\text{N}K\alpha$ line from the experimental peak are discussed which can be used on the computer of an automated electron microprobe. As an example, the application of these methods to the analysis of TiN_xO_y films on silicon is reported. (14 refs.)

63625 Isotopic analysis of nanomole gas samples by means of dynamic flow mass spectrometry. S.Halas (Inst. of Phys., Marie Curie-Skłodowska Univ., Lublin, Poland), H.R.Krouse.

Rev. Sci. Instrum. (USA), vol.54, no.4, p.437-43 (April 1983).

The sample size for conventional double collector isotope mass spectrometry has been reduced more than three orders of magnitude by using a 'pushing' gas for precise stabilization of sample pressure. The sample is stored in a long microcontainer (50 cm, 0.5 mm i.d.) to moderate the effect of diffusive mixing of sample with the pushing gas. If the analysis is sufficiently rapid (e.g. a run of 1 min for the unknown sample between two runs on the standard), then almost total sample consumption is possible. This method retains the high precision and simplicity of dynamic flow, yet possesses the high sensitivity of static mass spectrometry. (16 refs.)

63626 Electrode material for high-temperature oxygen partial pressure electrochemical sensors: strontium-doped lanthanum chromite. G.B.Barbi (Comm. of the European Communities, Joint Res. Centre, Ispra, Italy), A.Casiraghi, C.M.Mari.

Rev. Sci. Instrum. (USA), vol.54, no.4, p.486-92 (April 1983).

The electrochemical behavior of 20% strontium-doped lanthanum chromite (SDLC), deposited onto an 8% yttria-stabilized zirconia (YSZ) solid electrolyte, has been investigated. The electromotive force developed across the interface SDLC/YSZ and a Pt/YSZ reference at 0.21 atm (air) corresponds to the Nernst theoretical relationship. This behavior has been tested between 700° and 1000°C in the range 10^{-5} and 10^{-13} - 10^{-20} atm of oxygen, the lower pressures by the equilibrium of carefully calibrated steam and hydrogen mixtures. Although not demonstrated, it is probable that the oxygen pressure range of applicability of this mixed oxide electrode covers the entire field of pure ionic conductivity of any zirconia-base electrolyte. The fair agreement between the measured values and the theoretical EMF values, the resistance of the electrode layer to scaling, as well as its good thermodynamic stability, suggest SDLC as a possible alternative to platinum in high-temperature oxygen pressure sensors. (24 refs.)

63627 Particle induced X-ray emission (PIXE) analysis using RIKEN heavy ion linac. K.Maeda, Y.Sasa, S.Nakamura, M.Uda (Inst. of Phys. & Chem. Res., Saitama, Japan).

Rep. Inst. Phys. & Chem. Res. (Japan), vol.58, no.6, p.117-21 (1982). In Japanese.

Preliminary experiments for particle induced X-ray emission (PIXE) analysis using heavy ions accelerated by RILAC (RIKEN heavy ion linac) were carried out. The experiments proved that the RILAC can be used for RIXE analysis. (6 refs.)

63628 Attachment of low-energy electrons to O_2 molecules in some gases and liquids: an instrument for measuring concentrations of electronegative impurities in gases. A.S.Barabash, A.A.Golubev, O.V.Kazachenko, B.M.Ovchinnikov (Inst. of Nuclear Res., Acad. of Sci., Moscow, USSR).

Sov. Phys.-Tech. Phys. (USSR), vol.27, no.10, p.1261-6 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.2054-62 (Oct. 1982). [received: April 1983]

The attachment coefficients of electrons to O_2 molecules are measured in the following gases: Ar, CH_4 , 90% Ar+10% CH_4 , 50% Ar+50% CH_4 , and 95% Ar+5% NH_3 for pressures 3-12 kg/cm² and $E/P \leq 0.5$, and in liquid argon for $E=0.2-2$ kV/cm. An electron trap detector is described which produces a nearly spherical electric field and has an oxygen sensitivity in gaseous argon equal to 5×10^{-8} (by volume). It is shown that the sensitivity of electron trap detectors can be significantly increased by adding gases such as CH_4 , NH_3 , C_2H_6 , etc., to the sample. (26 refs.)

63629 Electroanalytical glucose sensor. U.Gebhardt, G.Luft, K.Mund, W.Preidel, G.J.Richter (Siemens AG, Erlangen, Germany).

Siemens Forsch. & Entwicklungsber. (Germany), vol.12, no.2, p.91-5 (1983). An artificial pancreas consists of an insulin depot, a dosage unit and a glucose sensor. The measurement of the actual glucose concentration in blood is still an unsolved problem. Two methods are described for an electroanalytical glucose sensor. Under the interfering action of amino acids and urea in-vitro measurements show an error of between 10% and 20%. (4 refs.)

63630 AES investigations of chemical composition of some alkali compounds. P.Dolizy, F.Grolier (Lab. d'Electronique et de Phys. Appl., Limeil-Brevannes, France).

Surf. & Interface Anal. (GB), vol.5, no.1, p.4-12 (Feb. 1983).

Auger electron spectroscopy is used as a quantitative and qualitative tool to investigate solid surfaces. Conventional quantitative analyses are based on the comparison of the Auger signal from the sample to that from pure standard. A detailed analysis of peak shape of Auger signal shows that the upper part of the derived Auger line (lower energy side) is strongly related to the chemical bonding whereas the lower part (high energy side) is nearly insensitive to the chemical effects. A calibration method for quantitative Auger spectro-

scopy based on the amplitude variation of the LVV Auger transitions of one element as a function of its chemical bonding within the compound is described. This method takes into account sample 'matrix' effects as well as all kinds of instrumental effects on the measured Auger signal. It has also been shown that AES can be used to make successful chemical analyses on alkali antimonides. A direct relation between electronic charge transfer between atoms and Auger peak shape has been observed, it is used to relate photoelectric quantum yield of SbK_x compound to the ionicity of the Sb-K bond. (33 refs.)

63631 Foundations, models and judgement of ionisation-smoke-detectors. I. Introduction and operating method. G.Meyer (Friedrich Merk-Telefonbau GmbH, Munchen, Germany).

Tech. Mess. (Germany), vol.50, no.3, p.93-7 (March 1983). In German. Describes the principle of smoke-sensitive I-chambers and introduces a theoretical model for the derivation of I-V-characteristics. With simple approximations the effect of influence quantities is discussed. A summary of various criteria for judging ionisation-smoke-detectors is presented. (no refs.)

63632 The application of plasma mass spectroscopy to plasma etching. K.M.Eisele (Fraunhofer-Inst. für Angewandte Festkörperphys., Freiburg, Germany).

Vak.-Tech. (Germany), vol.32, no.2, p.48-52 (March 1983). In German.

The mass spectrometer as used for residual gas analysis is often employed to gain insight into plasma processes, for instance when sputtering or plasma etching. In Plasma etching the gases used are of complex, mostly molecular structure and sometimes mixtures of several gases, which are excited and partially fractured in a glow discharge. The mass distribution of the resulting components is being changed when they pass through the ionizer which precedes the quadrupole mass filter. A plasma mass spectrometer does not require such an ionizer. It therefore does not change the composition of the constituents and provides more accurate information about the etch process. Some examples will demonstrate its application. (6 refs.)

63633 On the analysis of inhomogeneous glasses with the electron microprobe. H.Reiss, L.Horn, H.Bruhl (Sektion Chemie, Friedrich Schiller Univ., Jena, Germany).

Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.31, no.6, p.1131-7 (1982). In German.

There are different problems in quantitative electron microprobe analysis of microphases or crystalline inhomogeneities in glasses. The diameter of the inhomogeneities may be too small and in the case of metastable separation the distance between the droplets too low. Such problems are illustrated graphically and proved by examples. An additional error results from penetration of primary electrons in glasses, generally consisting of light elements. (3 refs.)

63634 Methane as the energy supply from peripheral resources coal and natural gas. L.Biondi.

Elettrotecnica (Italy), vol.69, no.12, p.1151-2 (Dec. 1982). In Italian.

The paper gives some information on work carried out in Italy. It was a study concerned with diminishing energy supplies and the problems involved in transporting energy over appreciable distances and also of storing energy sources. Much energy at present is derived from coal, hydro sources and oil and is then converted into electricity. Attention was paid particularly to the possibilities of using methane, often a by product of coal and natural gas. The transport and storing of this offers interesting possibilities and the paper states that more attention should be paid to the gasification of coal to obtain methane prior to burning as at present. Various alternative methane producing systems are mentioned, together with their basic working systems. (no refs.) G.V.D.

63635 The properties of a metal hydride fuel for use in an urban vehicle. D.H.Bradhurst, P.M.Heuer (Lucas Heights Res. Labs., CSIRO, Sutherland, NSW, Australia), H.C.Watson, E.E.Milkins, J.Edsell, W.R.B.Martin, A.Kempf.

J. Less-Common Met. (Switzerland), vol.89, no.2, p.575-83 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).

Fe-Ti-Mn alloys were evaluated for use for the storage of hydrogen fuel in a demonstration urban vehicle. The activation and poisoning characteristics of the alloys were studied with the aim of both minimizing the operating temperatures and pressures and reducing the overall weight of the fuel storage assembly. Alloy structures were studied by metallography, X-ray and neutron diffraction and electron microprobe analysis. Small amounts of magnetic Fe_2Ti impurity and an oxygen-rich phase found by these methods did not seriously affect the hydrogen capacity of the alloys. The vehicle was equipped with a four-cylinder internal combustion engine which has been successfully modified to run smoothly on hydrogen fuel. Water injection was needed for satisfactory operation at power levels in excess of 20 kW, but satisfactory operation could be achieved at lower powers by using a modified inlet valve, a dual manifold system and other modifications to the ignition, valve timing and engine tolerances. 86.10D Wind energy

63636 Mathematical programming models for the economic design and assessment of wind energy conversion systems. K.A.Reinert (Granville Corp., Washington, DC, USA).

Wind Eng. (GB), vol.7, no.1, p.43-59 (1983).

System reliability is one of the important determinants of the economic and technical feasibility of wind energy conversion systems. The inclusion of storage facilities into these systems greatly increases their reliability. Recognizing this, two inter-period mathematical programming models are formulated which optimize the design of a wind energy conversion system, locating wind turbines in a number of distinct arrays, sizing a storage facility, providing rules for the operation of the storage facility, and ensuring that a pre-specified level of demand is met. In both models, the storage facility is modeled via linear decision rules. In the second model, system reliability is explicitly addressed via chance constraints, and demand is met with a given level of probability. (15 refs.)

63637 Proposal for a new design of wind power generator. H.H.Rosenbrock (Control Systems Centre, Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).

Contains simulation model results for a sample agricultural wind energy application which depicts a hypothetical winter wheat and sorghum farm. (1 rel.)

86.10F Tidal and flow energy

(inc. water-wave energy)

- 63639 Hydro-electricity in India.** J.J.De Lima, H.Dickinson, H.W. Whittington (Dept. of Electrical Engng., Univ. of Edinburgh, Edinburgh, Scotland). Seventeenth Universities Power Engineering Conference, Manchester, England, 30 March-1 April 1982 (Manchester, England: Univ. Manchester Inst. Sci. Technol. 1982), 6 pp.
Although the paper is concerned with the role of hydro-electric generation, it sets this in context by reviewing briefly the contribution of other sources. The potential of India's large river system is surveyed, with the historical development of water power, present trends and future prospects. (6 refs.)

86.10H Geothermal energy

- 63640 A forecast of geothermal drilling activity.** A.J.Mansure, G.L.Brown (BDM Corp., Albuquerque, NM, USA). *Geothermal Energy (USA)*, vol.10, no.11, p.8-18 (Nov. 1982). Estimates the number of geothermal wells to be drilled in the United States for each 5-year period to 2000 AD. The report presents forecasts of the growth of geothermally supplied electric power. The report then quantifies the different types of geothermal wells needed to support the forecasted capacity. The rate of growth of electric capacity at geothermal resource areas is expected to be 15 to 25 percent per year (after an initial critical size is reached) until natural or economic limits are approached. Five resource areas in the United States should grow to significant capacity by the end of the century. The best estimates of the number of wells that must be drilled in each 5-year period to support the electric capacity are given. About 5000 geothermal wells are expected to be drilled in support of all electric power projects in the United States from 1981 to 2000 AD. The reported numbers include production, exploration, injection, and replacement wells and take into account drilling other resource areas. The Geysers area is expected to retain most of the drilling activity for the next 5 years. By the 1990s, the Imperial Valley is expected to contain most of the drilling activity with the result that half of the geothermal wells drilled in the next 20 years will be in the Imperial Valley. (19 refs.)

- 63641 L'énergie géothermique a basse enthalpie pour le chauffage des locaux** (The geothermic energy based on enthalpy for district heating). M.Villaume.

Report EUR 7802 FR, Comm. European Communities, Luxembourg (1982), 92 pp. In French. Contract 584-78 EGF.

Some of the parameters affecting geothermal energy development, principally the effect of borehole yield and temperature, and the power of the heat-pump are discussed. The effects of climate and intercore systems are noted. The production and application systems are first examined theoretically, and the effect of costs under various headings on profitability are studied. The results are presented in graphical form.

- 63642 Faisabilité technique et économique de la géothermie basse énergie en Europe** (Technical and economic feasibility of deep geothermal energy in Europe).

Report EUR 8241/I FR, Comm. European Communities, Luxembourg (1982), xiv+264 pp. In French. Contract 640-78 EGF.

The practicability of using low energy (30°C to 150°C) geothermal energy in Europe, and already exploited for 10 years in France, is examined. Investigates the possible geothermal sites, gives an inventory of potential resources and an economic balance-sheet. The applications of such sources (not suitable to power generation) in district heating, agriculture, industry and fish farming are discussed.

86.10K Solar energy

- 63643 Effect of solar gain through walls and windows on annual building heat needs.** M.G.Davies (Dept. of Building Engng., Univ. of Liverpool, Liverpool, England).

Int. J. Ambient Energy (GB), vol.3, no.4, p.181-6 (Oct. 1982). [received: March 1983]

A window with an open south facing aspect (in the United Kingdom) can admit large solar gains in cold but sunny conditions and will then reduce the need for back-up heating. In cold overcast conditions the same window will cause a bigger demand to be placed upon the heating plant. The net energy need depends upon the local climate, the comfort temperature chosen, ventilation losses and the design of the window or glazed wall. A study is reported using 50 years of jointly occurring daily values of temperature and irradiance at 53.4°N. A rank order is suggested for the effectiveness of various constructions as energy saving components. (4 refs.)

- 63644 Study of water heating by solar energy through the ground.** M.Soulas, Hladik J. (Lab. d'Energetique Solaire, Univ. d'Angers, Angers, France), G.Le Palec, M.Daguene.

Entropie (France), vol.19, no.109, p.32-5 (1983). In French.

Studies the heating of water flowing vertically through the ground the surface of which is irradiated by the incident solar flux. The authors calculate analytically the temperature profile as a function of depth and time, and compare the results with their experience. (7 refs.)

- 63645 Comparison of annual passive systems efficiencies in the Mediterranean zone.** E.Tasdemiroglu (MTA, Ankara, Turkey), F.Ramos, D.Tinaut.

Opt. Pura & Apl. (Spain), vol.15, no.3, p.115-18 (1982).

An experimental evaluation of thermal performance of a thermic accumulation wall is made with the construction of a dwelling in the 'Solar Energy Thermic Applications Center' of MTA (Marmaris). The annual energy balances of the house were established with the aid of computer simulation programs of CSIC. Finally, a comparison of annual energy balances of the CNRS solar house of Odello was made with Marmaris house, the differences between both houses being interpreted in accordance with the structural characteristic of dwellings, the geographical situation and meteorological conditions. (7 refs.)

- 63646 Economical analysis of residential solar water heating systems.** G.Barcelo, R.Urculo (Installation Engng. Consultant Office, Madrid, Spain), E.Tasdemiroglu.

Opt. Pura & Apl. (Spain), vol.15, no.3, p.147-61 (1982).

This study analyzes the economic feasibility of residential solar water heating systems. Different conventional installations, using different fuels (butane, electricity, fuel oil), are compared with solar energy installations. Three economic/technical models which include the influence of increasing fuel cost are presented and compared with other possible kinds of investments to determine the economic feasibility of the system. It is found that different economic conclusions are possible and justifiable for investment situations having differ-

ent constraints. The results of the present study would be a sufficient documental base so as to set the decisions within the alternative solutions of national energy policy. (8 refs.)

- 63647 Solar heating of a tank at an aquiculture pilot plant.** R.Palmer, J.Riera, A.Calera (Dept. de Física, EITI, Valencia, Spain), D.Tinaut.

Opt. Pura & Apl. (Spain), vol.15, no.3, p.163-7 (1982). In French.

A solar heating installation is reported in which solar energy is applied in an aquiculture pilot plant where a constant thermal level during the entire year must be maintained. By using solar storage as the heat source for the biological basin, the resulting lower storage temperatures should allow higher collection efficiencies. Description and operation of the experimental installation is discussed. (5 refs.)

- 63648 Lambertian analysis of mirrors and Fresnel lenses for solar concentration.** A.Luque, E.Lorenzo (Inst. de Energia Solar, Univ. Politécnica Madrid, Madrid, Spain).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.666-70

Concentrators for extended sources useful for tracking and quasi-static applications are analysed, based on the idea that maximum energy on the collector is cast if the concentrator illuminated by the source becomes a Lambertian source. It is demonstrated that the achievement of this condition is not compatible with the condition of casting on the collector all the energy entering the concentrator. Different analysis of concentrators are presented based on these ideas. (7 refs.)

- 63649 A 500 W_{PK} photovoltaic concentrator using a glass laminated metal membrane reflector.** W.Haaf, K.Hagenlocher.

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.677-81

A 3 m diameter parabolic dish has been constructed. The reflector shape has been chosen such as to give a most homogeneous intensity distribution for a geometric concentration ratio of C=50. As converter a C50 generator using new monocrystalline Si concentrator cells has been developed. The system is placed in polar position and tracked by driving one axis. The generator drives a consumer water pump and feeds two batteries as a buffer storage for tracking, closed water circuit cooling, and electronic control. Outdoor tests have been started. (no refs.)

- 63650 Fluorescent planar concentrator (FPC) Monte-Carlo computer model limit efficiency and latest experimental results.** K.Heidler, A.Goetzberger, V.Wittwer (Fraunhofer-Inst. für Solare Energiesysteme, Freiburg, Germany).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.682-6

A Monte-Carlo computer model for simulation and optimization of fluorescent concentrators is described. The program calculates absolute efficiencies 'ab initio'; agreement between simulated and experimental data is good. Power flow diagrams and optimization characteristics for single sheet collectors and collector stacks are discussed. It is shown that stacking of up to three sheets does not degrade the concentration ratio. For a 'realistic-ideal' three-sheet collector stack, 9% electrical efficiency at an optical concentration ratio of 10 is derived as a conservative upper limit for the conversion of solar radiation into electrical energy by a photovoltaic FPC-system. Presently the best experimental values for a right angle triangle with 400 cm² area and 3 mm thickness are 9% optical and 2% total electrical efficiency with Si-solar cells. The concentration ratio at the output edge is 2.9. For a three sheet stack an electrical efficiency of 3.1% could be reached. (11 refs.)

86.10N Nuclear energy

- 63651 Electricity generating costs when changing from the PWR to the APWR.** W.Seifritz, P.Wydlar (Inst. für Reaktorforschung, Wurenlingen, Switzerland).

Atomwirtsch.-Atomtech. (Germany), vol.28, no.1, p.28-31 (Jan. 1983). In German.

There has been a great deal of discussion recently about the advanced pressurized water reactor as a successor to the present line of pressurized water reactors prior to the introduction of the fast breeder line. The basic underlying idea is the rise in the conversion ratio to 0.9-0.95 by means of spectrum hardening achieved as a result of a reduced moderator fraction. Aside from all technical problems it is assumed that an advanced pressurized water reactor is technically feasible and will be licensed. For a utility company the first question arising is that of the reduction of costs of a kilowatt-hour of electricity generated in the advanced reactor as against a classic pressurized water reactor. More specifically, the point of interest is the uranium price level from which an advanced pressurized water reactor with its higher conversion ratio is able to reduce the electricity generating costs compared to a present pressurized water reactor. (5 refs.)

- 63652 World resources of natural uranium.** M.V.Ziegler, E.Bertel.

Tech. Mod. (France), vol.74, no.11-12, p.29-36 (Nov.-Dec. 1982). In French. [received: March 1983]

Uranium ore is distributed very widely (but not uniformly) throughout the world, and deposits are frequently discontinuous. Following a brief geological note, and definitions of resource categories, some tabulated figures for the principal world sources are given. The recovery efforts made in the main exploiting countries are reviewed, and the final section deals with consumption and demand, and factors affecting the market. (no refs.) J.S.

- 63653 The place for fast breeders in the French energy situation.** J.Petit, L.Vautrey (CENS, Gif-sur-Yvette, France).

Proceedings of the L.M.F.B.R. Safety Topical Meeting, Lyon-Ecully, France, 19-23 July 1982 (Paris, France: Société Française d'Energie Nucleaire 1982), p.95-101 In French.

France is poorly situated regarding indigenous supplies of fossil fuels; in 1980, 98% of oil consumed was imported, 70% of the gas and 56% of the coal. With this background, electricity generation has shown a sharp decrease in the oil fraction, a rise in nuclear and 'new' sources (solar, biomass, geothermal, wind, waves), with coal and hydro more or less the same. As recent generating costs quoted are 16, 26 and 56 centimes/kWh for nuclear, coal

and oil respectively, there is a strong economic incentive for nuclear. The programme up to 1990 envisages the commissioning of 1900 MWe PWR and 5 at 1300 MWe, and an extension of the La Hague reprocessing plant of 2 units of 800 tonnes/year capacity. From 1991 on, various options are available, with special emphasis on the fast reactor concepts Rapsodie, Phenix and Super-Phenix I. The new project embracing the Creys-Malville fast breeder reactor is of particular interest, especially as an overall generating cost of 80% of an equivalent PWR has been estimated. (no refs.) G.C.

63655 Redox ion flow cell for solar energy storage. H.Cnobloch, W.Kelermann, H.Nischik, K.Pantel, G.Siemens (Siemens AG, Erlangen, Germany). *Siemens Forsch. & Entwicklungsber. (Germany)*, vol.12, no.2, p.79-84 (1983).

In redox ion cells the energy is stored in solutions of metal ion pairs at different states of oxidation, such as for example Fe^{2+}/Fe^{3+} and Cr^{2+}/Cr^{3+} . Graphite foils serve as electrodes for the conversions and they are activated with 0.2 mg Pb per cm^2 and 0.2 mg Au per cm^2 for the reaction $Cr^{2+} = Cr^{3+}$. The separation of cathode and anode is achieved by an ion exchange membrane. A completely charged cell can be loaded with a current density of more than 100 mA/ cm^2 at 0.7 V and at 30°C. (6 refs.)

63656 Cross-linked polyvinyl alcohol films as alkaline battery separators. D.W.Sheibley, M.A.Manzo, O.D.Gonzalez-Sanabria (NASA, Lewis Res. Center, Cleveland, OH, USA). *J. Electrochem. Soc. (USA)*, vol.130, no.2, p.255-9 (Feb. 1983).

Cross-linking methods have been investigated to determine their effect on the performance of polyvinyl alcohol (PVA) films as alkaline battery separators. The following types of cross-linked PVA films are discussed: (i) PVA-dialdehyde blends post-treated with an acid or acid periodate solution (two-step method), and (ii) PVA-dialdehyde blends cross-linked during film formation (drying) by using a reagent with both aldehyde and acid functionality (one-step method). Laboratory samples of each cross-linked type of film were prepared and evaluated in standard separator screening tests. Then pilot plant batches of films were prepared and compared to measure differences due to the cross-linking method. The pilot-plant materials were then tested in nickel oxide-zinc cells to compare the two methods with respect to performance characteristics and cycle life. Cell test results are compared with those from tests with Celgard. (7 refs.)

63657 Electrolyte film structure on battery separator and electrode materials. H.F.Bittner, C.C.Badcock (Chem. & Phys. Lab., Aerospace Corp., El Segundo, CA, USA).

J. Electrochem. Soc. (USA), vol.130, no.2, p.259-64 (Feb. 1983). Structural properties of alkaline electrolyte films on battery electrode and separator materials are investigated. Thermodynamic principles that affect film formation are presented, and a model is developed that predicts the wetting-dewetting transition, for a network of fibers, as a function of electrolyte volume and fiber network compactness. Film characteristics on single fibers and networks of a variety of materials are studied by a laser diffraction technique and by conductivity measurements. Materials studied include nickel, cadmium, nylon, polypropylene, and Teflon. Wetting characteristics of actual separator materials are studied in a simulated battery environment. Experimental results yield good agreement with the model. (6 refs.)

63658 Use of photovoltage for electrodeposition on solar cells. V.K.Jain (Solid State Phys. Lab., Delhi, India), A.P.Kulshreshtha. *Indian J. Technol.*, vol.20, no.9, p.373-5 (Sept. 1982). [received: March 1983]

A new technique is reported for the electrolytic deposition of a metal on a solar cell. The technique does not employ an external electric bias field, but uses the internal photoinduced voltage of the solar cell itself. The experimental details of depositing silver over the existing metallized contact structure of the cell and a transparent conducting oxide coating over the entire solar cell front surface are presented. The proposed technique reduces the consumption of the processing materials and makes the fabrication procedure less expensive and simplified. (6 refs.)

63659 Photovoltaics: an alternative form of energy. R.Buhs, V.Cordes. *Ind.-Anz. (Germany)*, vol.105, no.24, p.60-3 (25 March 1983). In German. Discusses direct conversion of solar power into electric power, and describes solar cells presently available. Multicrystalline, metal/insulator/semiconductor and indium/tin oxide solar cells and cells made by vapour condensation, screen printing and ion implantation under development are discussed. System costs and generating costs (£0.30-0.90/kWh) are briefly considered. (no refs.) J.S.

63660 Tough photovoltaics for military and civil use. *Int. Power Generation (GB)*, vol.6, no.2, p.44-5 (March 1983).

Solar photovoltaic panels are an excellent source of power where silence and lack of moving parts are more important than first cost. The technique of producing solar cells from wafers of single crystal silicon is now well proven but many photovoltaic modules have been let down by poor packaging which deteriorates rapidly and allows ingress of water to the connections to the crystals causing rapid breakdown. There are signs that this state of affairs is changing, and some manufacturers have taken great pains to produce modules which are resistant to weather and unsympathetic handling. (no refs.)

63661 Thermal and mechanical properties of multilayer substrates for low-cost solar cells obtained by dry-pressing. G.Celotti (Istituto Lamel-CNR, Bologna, Italy), L.Moretini, G.Ortelli.

J. Mater. Sci. (GB), vol.18, no.4, p.1005-14 (April 1983).

A study has been made of the possibility of producing ceramic substrates for low-cost solar cells by means of the simple technology of moulding by dry-pressing. Special attention was taken to avoid adding costly materials (organic and inorganic) to the basic commercial kaolin. It emerged that the only treatment necessary was the precalcination of approximately half the powder at temperatures of 1200 to 1350°C. The various characterization techniques showed that, in spite of the simplicity of the technologies utilized, after a final firing at 1600°C, one can obtain finished products with the same thermal expansion coefficient as silicon (from ambient temperature to 800°C) and with mechanical characteristics that make the products perfectly suitable for resistance to the thermal shock, resulting from contact with molten silicon. (14 refs.)

63662 Low-cost solar power is on the horizon. B.H.Carlisle.

Mach. Des. (USA), vol.55, no.4, p.58-65 (24 Feb. 1983).

Describes the Si solar cell and discusses the growth process for single crystals of the semiconductor. The first generation of Si cells were grown using the Czochralski process, but newer techniques of crystal growth are now becoming commercial. These newer techniques are described, including semicrystalline cell casting, the dendritic web, edge-defined film-fed growth, and amorphous Si cells. (no refs.)

63663 Silicon solar cells for terrestrial applications. J.G.Grabmaier (Forschungslab., Siemens AG, München, Germany).

Naturwissenschaften (Germany), vol.70, no.3, p.127-32 (March 1983). In German.

The direct conversion of solar energy to electrical energy (photovoltaic effect) by solar cells is receiving increasing attention on the world-wide scale. Photovoltaic energy conversion offers itself to a practical and meaningful implementation in regions without a conventional energy grid. The author deals with the principles of silicon solar cells for terrestrial applications and new methods for the production of the necessary silicon. (13 refs.)

63664 Capacitance of amorphous silicon pin solar cells. H.P.Neiderer, B.Rauscher.

Phys. Status Solidi a (Germany), vol.75, no.2, p.537-45 (16 Feb. 1983).

The i-region of pin solar cells on the basis of amorphous silicon provides the carrier collection. The density of (localized) states (DOS) in the region diminishes the electric field, favors recombination and limits the collection efficiency. The low-frequency capacitance of pin diodes is indicative for the DOS. The small-signal capacitance of a pin solar cell is measured in the frequency range 0.1 to 10³ Hz for temperatures between 30 and 100°C at zero DC bias. A simple diode model is suggested. It involves the assumption of constant DOS values in the p-, i-, and n-regions. These values are determined by fitting. It is shown that low-level doping of the i-region and illumination stress significantly raise the capacitance and the DOS. (19 refs.)

63665 Cascade heterophotocells using wide-gap A^{III}B^{VI} compounds. P.A.Gashin, G.G.Dvornik, M.B.Kagan, T.L.Lyubashevskaya, A.V.Simashkevich, A.Ya.Foksha (V.I. Lenin State Univ., Kishinev, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.8, p.403-4 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.930-3 (Aug. 1982). [received: April 1983]

Reports a study of an nZnSe-pZnTe-nCdSe heterophotocell fitted with a contact structure which allows the nZnSe-pZnTe and pZnTe-nCdSe heterojunctions to be connected in separate circuits. The cascade structure was fabricated through the successive epitaxial deposition from the gas phase of ZnTe and CdSe layers on the (110) plane of single-crystal ZnSe substrates with a thickness of 0.2-0.5 mm. (6 refs.)

63666 Grain boundary effects in polycrystalline silicon solar cells. I. Solution of the three-dimensional diffusion equation by the Green's function method. N.C.Halder, T.R.Williams (Dept. of Phys., Univ. of South Florida, Tampa, FL, USA).

Sol. Cells (Switzerland), vol.8, no.3, p.201-23 (April 1983).

For the polycrystalline silicon solar cell problem, the three-dimensional diffusion equation of the minority carrier with grain boundary effects has been solved for the first time using Green's function method. New analytic expressions for the photocurrent and the dark current of an n-p junction fibrously grained cell have been derived. The present three-dimensional theory, which is an improvement over the previous one-dimensional theory, points out correctly the limiting factors of the solar cell. It has been shown that the current-voltage characteristics and the efficiency of a polycrystalline n-p junction cell are critically influenced by the grain boundary effects. (36 refs.)

63667 Grain boundary effects in polycrystalline silicon solar cells. II. Numerical calculation of the limiting parameters and maximum efficiency. N.C.Halder, T.R.Williams (Dept. of Phys., Univ. of South Florida, Tampa, FL, USA).

Sol. Cells (Switzerland), vol.8, no.3, p.225-38 (April 1983).

For pt.1 see ibid., vol.8, no.3, p.201-23 (1983). Extensive numerical calculations have been made of the photocurrent, the dark current and the fill factor for n-p junction polycrystalline silicon solar cells utilizing previously developed theory in three dimensions. Various grain boundary effects such as grain boundary recombination velocity, grain size and grain orientations were considered. It has been shown that for zero grain boundary effect the current-voltage characteristics, fill factor and efficiency approach the single-crystal limit. For polycrystalline silicon solar cells it has been demonstrated that an efficiency of about 15% could be produced with fibrously grained samples of grain size 100 μ m, recombination velocity 100 m s⁻¹ and thickness 100 μ m. (16 refs.)

63668 Diffusion length determination in n⁺-p-p⁺ structure based silicon solar cells from the intensity dependence of the short-circuit current for illumination from the p⁺ side. G.C.Jain, S.N.Singh, R.K.Kotnala (Div. of Materials, Nat. Phys. Lab., New Delhi, India).

Sol. Cells (Switzerland), vol.8, no.3, p.239-48 (April 1983).

A new method of diffusion length measurement in n⁺-p-p⁺ structure-based silicon solar cells is presented. This method exploits the strong dependence of the collection efficiency of the p-n junction on both the thickness d and the diffusion length L of the minority carriers in the p-base region when the p-n junction is separated from the illuminated surface by the base region. The cell is illuminated from the p⁺ side with monochromatic radiation and the variation in the short-circuit current density J_{sc} with the intensity P_0 is measured. The diffusion length is determined from the slope of the J_{sc} versus P_0 curve. The validity of this method is not limited to the cases of $d/L > 1$ and, in practice, it may be suitable for cells with $d/L > 0.6$. In the present case it was used to determine L in n⁺-p-p⁺ silicon solar cells with bifacial symmetry. These cells had $d/L > 2.5$ and the values of L determined by the present method showed a remarkable agreement with those determined from the photoluminescence measurement for illumination from the n⁺ side. (18 refs.)

63669 Design of antireflection coatings for textured silicon solar cells. B.L.Sopori, R.A.Pryor (Solar Energy Res. & Dev., Motorola Inc., Phoenix, AZ, USA).

Sol. Cells (Switzerland), vol.8, no.3, p.249-61 (April 1983).

The design of a thin film coating to optimize the performance of a textured silicon solar cell is described. A ray optics approach is used to determine the reflection characteristics of textured cells with a two-layer thin film coating. A generalized expression for the external quantum efficiency in terms of the given internal quantum efficiency and the coating parameters is determined. The parameters of the thin film layers, the refractive indices and the thicknesses are determined so as to maximize the integrated cell response to an air mass 2 spectrum. (7 refs.)

63670 Reactive sputtered Ta_2O_5 antireflection coatings. F.Rubio (Escuela de Ingenieros Industriales, San Sebastian, Spain), J.Denis, J.M.Albella, J.M.Martinez-Duart.

Sol. Cells (Switzerland), vol.8, no.3, p.263-8 (April 1983).

Ta_2O_5 antireflection coatings were prepared by reactive sputtering from a tantalum target in a magnetron system. The optical constants of the films were determined from reflectance and transmittance spectra in the 0.25-2.5 μm wavelength interval. The refractive index was close to 2.0 in the visible region, resulting in optimum impedance matching for silicon solar cells. The sputtered Ta_2O_5 films showed an absorption coefficient smaller than about $10^3 cm^{-1}$ for photon energies below 4 eV. Finally, sputtered Ta_2O_5 antireflection coatings were tested on silicon solar cells and were found to increase the efficiency of the cells from 9.5% to 12.9%. (14 refs.)

63671 The fill factor of a solar cell from a mathematical point of view. A.De Vos (Lab. voor Elektronica en Meettech., Rijksuniv. te Gent, Gent, Belgium).

Sol. Cells (Switzerland), vol.8, no.3, p.283-96 (April 1983).

The problem of finding the fill factor of a solar cell given the values of the network elements, i.e. the photogenerated current, the dark saturation current, the diode quality factor, the shunt resistance and the series resistance, is tackled. Cases without shunt or series losses are treated first and then cases with small shunt and series losses are considered. Most of the proposed solutions to the problem are presented in the form of infinite expressions so that the user can obtain the desired accuracy by suitable truncation of these expressions. (11 refs.)

63672 Gallium arsenide concentrator solar cells. M.Yamada, A.Kitamura (Kansai Electric Power Co. Inc., Osaka, Japan), T.Yamaguchi, M.Kawashima, K.Motoyoshi, S.Iguchi, Y.Sasatani.

Sumitomo Electr. Tech. Rev. (Japan), no.22, p.243-50 (Jan. 1983).

The GaAs solar cell is advantageous in that it can be used under highly concentrated sunlight. By using this material in concentrating photovoltaic power generation it is possible to reduce the required amount of GaAs per unit generation. The authors introduce the structure of such GaAs concentrator solar cells, an outline of their fabrication process, design of an anti-reflection coating and a grid pattern and their characteristics. (7 refs.)

63673 Development of a 1pKW photovoltaic concentrator system with silicon cells. M.Giuffrida, A.Oberli, P.Zani, G.Dionisio, G.Ramacciotti, G.Scarpi, M.Conti, P.Nason.

Report EUR 8200 EN, Comm. European Communities, Luxembourg (1982), 41 pp. Contract 456-78-1 ESI.

The authors describe the development work between January 1978 and December 1979 on the design, construction and preliminary testing of a 1 pKW photovoltaic unit with concentration ($\times 50$), passive cooling and silicon cells. The concentration system, devised in prototype form, involved cooling system optimisation, optical and tracking systems considerations as well as photovoltaic cell design. From preliminary outdoor tests an overall efficiency close to 9% has been measured, using a single subarray of 14 cells. The results of the program should be useful for the evaluation of the merits of using small concentrator type photovoltaic units in southern Europe and assist in adapting the characteristics of the photovoltaic generator to the requirements of a dependable electricity producing system ready to meet load demands at any time.

63674 Conception, analyse du systeme, realisation et experimentation d'un generateur photovoltaïque autonome de 5 kW Au Refuge des Evettes (Conception, analysis of the system, realisation and experimentation of an autonomous 5 kW photovoltaic generator at the Refuge des Evettes). B.Aubert.

Report EUR 8204 FR, Comm. European Communities, Luxembourg (1982), 48 pp. In French. Contract 463-78-1 ESF.

The results of a study carried out on the independent Photovoltaic Generator installed at the Evettes Refuge deals with the evolution of the system under working conditions. The effects of winter conditions and the precautions taken are first examined followed by a description of snow clearance and starting-up procedures (battery charging, etc.).

63675 Cellules solaires au CdTe en couches minces polycristallines. Elaboration par pulvérisation triode et transport a courte distance (CdTe solar cells in polycrystalline thin films. Elaboration for triode sputtering and short distance transport). Y.Marfaing.

Report EUR 8213 EN/FR, Comm. European Communities, Luxembourg (1982), 62 pp. Contract 436-78-1 ESF.

CdTe is a semiconductor compound which has been studied for some time because of interest in photovoltaic conversions. The author studies CdTe homojunctions and the realisation of polycrystalline CdTe thin films. In the study of homojunctions he analyses the electrical conduction mechanisms and their influence on the conversion efficiency, the photoelectric efficiency of the junction in relation to volume and surface recombination. To this aim he considers the conditions of preparation and characterisation of the junction surface layers. The possibilities of triode sputtering are explored. Co-sputtering of Cd and CdTe are investigated with a view to obtaining stoichiometric composition and control of electrical resistivity. Three references are reprinted in full in an appendix.

63676 Integrated thin film solar cell generators with higher output voltages.

Report EUR 8160 EN, Comm. European Communities, Luxembourg (1982), 57 pp. Contract 428-78-ES D/ESC-R-003-D (B).

A technology for the production of large-area integrated Cu_2S -CdS thin film solar cell generators with higher output voltages was developed. On glass substrates with an area of $14.5 \times 29 cm^2$ integrating Ag-back contacts are vacuum-deposited. The CdS-layers are produced by evaporating CdS-powder with the aid of a large-area evaporator. They are comparable in quality with those CdS-layers that are vacuum-deposited with a point-type evaporator. For the production of the Cu_2S -layers two modifications of the Cleveite wet process was found to give good results: (1) dipping the cells in a flow of Cu^{+} -ion solution and (2) spraying the Cu^{+} -ion solution to rotating CdS substrates. A glass sheet, with an integrating Au-plated copper grid, serves for front-contacting and encapsulation. The copper grid is produced in situ on the front-glass by applying screen-printing and etching techniques to a 35 μm thick copper foil, which has been laminated to the front glass with a hot

setting adhesive. The front glass and the substrate glass carrying the active layers are laminated by applying higher temperatures and pressure. (17 refs.)

63677 Etude de la technologie d'un module solaire offrant une bonne dissipation thermique (Study of the technology of a solar module that offers good heat dissipation). D.Diguet, J.Anguet.

Report EUR 8159 FR, Comm. European Communities, Luxembourg (1982), 66 pp. In French. Contract 448-78-3 ESF.

Although the encapsulation of solar cells does not considerably affect the final cost of the module in the long run considerable economies may be achieved because cheaper materials, printed circuit techniques and automated production may be used. The technologies with relevant economics and performance characteristics for such a system are studied. A theoretical analysis of the heat flow in a solar panel is appended.

63678 Etude et realisation de croissances epitaxiales de composés III-V par pyrolyse mixte d'organometalliques et d'hydrures sous pression reduite: Application a l'etude de structures de piles solaires (Study and realisation of epitaxial growth of III-V compounds by mixed pyrolysis of organometallics and hydrides under reduced pressure: Application to the study of solar cell structures). G.Gave, M.Le Metayer, M.Orgert.

Report EUR 8207 FR, Comm. European Communities, Luxembourg (1982), 22 pp. In French. Contract 193-78 IESF.

The epitaxial growth of gallium arsenide by chemical reaction in the vapour phase, using organometals under low pressure for use in solar piles has been studied. The results are reported of Hall mobility tests on the products using two doping materials. The structure of photovoltaic layers is briefly examined, and their exploitation as solar cells is described.

63679 Increase of minority carrier diffusion length under the effect of a large band gap gradient [in solar cells]. A.Bouazzi, J.Mimila Arroyo (Lab. de Physique des Solides, CNRS, Meudon, France).

In Cellules solaires constituées de couches minces de CdTe polycristallines (Solar cells made from polycrystalline CdTe thin films), 8 pp., *Report EUR 8154 EN-FR*, Comm. European Communities, Luxembourg (1982), 75 pp. Contract 206-76 ESF.

It has been shown that a device constituted by a graded-gap material in front of a p-n junction will give a high efficiency solar cell. An expected property of the graded gap material is to increase the carrier diffusion lengths, bringing the collection factor to a maximum value. Direct determination of minority carrier diffusion lengths has been performed by measuring the junction current induced in an angle-lapped graded-gap p-n junction as a laser beam (He-Ne, 12 μm diameter) is scanned along the bevel surface. CdHgTe graded-gap structures were prepared by vapor phase transportation of HgTe on CdTe single crystal in isothermal conditions. In such structures effective diffusion lengths have been shown to vary linearly with the gradient of band gap and to increase by more than ten times. As an example in n-type graded solid solutions hole effective diffusion lengths up to 11.5 microns have been measured with a gap gradient of 0.23, $10^3 eV/cm$. This result confirms the validity of the graded band gap concept and opens the way to high efficiency solar cells.

63680 Solar cells made of thin layers of polycrystalline CdTe. Y.Marfaing (CNRS, Paris, France).

In Cellules solaires constituées de couches minces de CdTe polycristallines (Solar cells made from polycrystalline CdTe thin films), 25 pp., *Report EUR 8154 EN-FR*, Comm. European Communities, Luxembourg (1982), 75 pp. In French. Contract 206-76 ESF.

Outlines some of the general characteristics of these cells, one of the most promising methods of conversion of solar energy by a photovoltaic process. Experimental evidence is presented with a theoretical analysis of optimisation with an upper coating of a CdHgTe alloy. A theoretical appraisal of the preparation of thin coatings is then given. Diagrams are given to illustrate the theoretical results which have been obtained. The mathematical theories are then presented, together with a number of graphs obtained experimentally. There are also details concerning the homojunctions. (no refs.) G.V.D.

63681 Optimisation of new types of MIS silicon solar cells. R.Van Overstraeten, R.Mertens.

Report EUR 8142 EN, Comm. European Communities, Luxembourg (1982), 44 pp. Contract 439-78-1 ESB.

Deals with grating MIS solar cells. These structures rely on the introduction of an inversion layer by the fixed charge present in the insulating oxide that has been deposited onto the silicon. The insulating oxide also serves as an anti-reflection coating on the silicon. The inversion layer-substrate junction acts as a collecting barrier for the photogenerated minority carriers. The collected carriers travel through the inversion layer; the MIS structure present under the grid connects the inversion layer with the outside world. Since the active part of MIS grating cells is not covered by metal layers, no transparent metal layers are required in these structures. In addition, a second collection mechanism is present in these cells; it is a two dimensional diffusion of the generated carriers towards the MIS grid. (21 refs.)

63682 Photovoltaic requirements estimation - A simplified method. J.W.Doane, J.B.Gresham.

Report EPRI-AP-2475, Electr. Power Res. Inst., Palo Alto, CA, USA (Feb. 1983), 140 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. Presents a simplified, single-year analysis method for evaluating the economics of photovoltaic (PV) systems for central station applications. Details are provided of (1) a computer code developed to determine the fuel and variable operations and maintenance savings attributable to a PV system for a single year and (2) a method developed to represent PV system and module cost-performance trade-offs.

63683 750 suns concentrator modules using GaAs solar cells. E.Fanetti, C.Flores, G.Guarini, F.Paletta (CISE SpA, Milan, Italy).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.671-6

In order to make experience on high concentration and check the maturity of GaAs technology, two small size modules have been fabricated. In the first module, single GaAs cells, Fresnel lens 750 suns concentrators and passive cooling are used while in the second one a spectrum split approach and active cooling are applied in order to increase the conversion efficiency. In this last case, GaAs (1.43 eV bandgap) cells are combined with GaAlAs (1.7 eV bandgap) cells and optical filters transmitting the high energy part of sunlight to the high bandgap cell and reflecting the low energy part to the other one. The characteristics of the principal components such as GaAs and GaAlAs solar cells, Fresnel lenses, spectrum splitting optical filters and heat dissipators, described as well as the performances of the two photovoltaic modules. (4 refs.)

63684 Physical limitations of present thin film solar cells. Y.Marfaing (Lab. de Phys. des Solides, CNRS, Meudon, France). Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.688-97.

A comparison is made between the various thin film solar cells by stressing the physical factors which limit their present performances. A general diagram is drawn up on which each cell is localized by two coordinates: one is relative to photocurrent generation, the other is indicative of diode rectifying properties. These aspects are detailed by considering the diode saturation current, the electron-hole pair collection length and the curve filling factor in an unified way which makes use of reference values. The efficiency limitations are thus precisely pointed out and the possibilities of future improvements are discussed. (29 refs.)

63685 8% efficiency a-SiC:H/a-Si-H heterojunction solar cells. Y.Tawada, K.Tsuge, M.Kondo, K.Nishimura, H.Okamoto, Y.Hamakawa (Faculty of Engng. Sci., Osaka Univ., Osaka, Japan).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.698-703.

An experimental investigation for the wide gap window material in the amorphous silicon solar cell is shown on methane based and ethylene based a-SiC:H. The methane based a-SiC:H/a-Si-H heterojunction solar cell shows a larger short-circuit current density than the ethylene based one. From IR absorption analysis, methane based a-SiC:H film is recognized a rather ideal amorphous SiC alloy as compared with ethylene based one. It has been found through these investigations that the chemical bonding structure is an important factor for a window material. 8% efficiency barrier has been firstly broken through with this methane based a-SiC:H/a-Si-H heterojunction solar cell. (10 refs.)

63686 Amorphous silicon solar cells produced by a consecutive, separated reaction chamber method. Y.Kuwano, M.Ohnishi, S.Nakano, T.Fukatsu, H.Nishiwaki, S.Tsuda (Res. Center, Sanyo Electric Co. Ltd., Osaka, Japan). Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.704-8.

A consecutive, separated reaction chamber method has been developed for the fabrication of a-Si solar cells. In this method, p, i, and n layers are deposited in different reaction chambers, and the undesirable doping caused by residual dopant gases which remain in the reaction chamber can be avoided. Following various kinds of fundamental experiments, Glass/SnO₂/p(a-SiC)-i-n/Me type a-Si solar cells were fabricated by this method, and the best conversion efficiency was 8.15% with a size of 2 mm×2 mm in sunlight of AM-1. The best conversion efficiency for integrated type a-Si solar cells fabricated by this method was 6.35% with a size of 10 cm×10 cm. The integrated type a-Si solar cells are being experimentally used in battery chargers, radios, TV receivers, and a 2 kW demonstration plant. (5 refs.)

63687 Charge collection in a-Si:H solar cells. G.Muller, G.Muck, M.Simon, G.Winterling (Messerschmitt Bolkow Blohm GmbH, Ottobrunn, Germany).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.709-13.

The performance of p-i-n and Schottky barrier cells is investigated as a function of intrinsic layer thickness, d_i, up to d_i=2.5 μm. The main result is that the efficiency of p-i-n/ITO cells is limited by the extraction of photo-generated holes. The hole (μ_h)-product is determined from the saturation of the photocurrent with increasing reverse bias. The d_i-dependence of the hole (μ_h)-product indicates that charge collection in a-Si:H is severely limited by surface—and interfacial effects. (7 refs.)

63688 The effect of glow discharge excitation frequency on the performance of microcrystalline Si:H thin films and devices. R.R.Gay, D.L.Morel, D.P.Tanner, D.Kanani, H.S.Ullal (ARCO Solar Inc., Chatsworth, CA, USA). Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.714-18.

Alloys of Si and H prepared by the glow discharge decomposition of SiH₄ are being developed world-wide for use in thin-film solar cells. The present study focuses on two important aspects of this technology. The first is the effect of excitation frequency on intrinsic material properties, and the second is the influence of processing methodology on device performance. Measurements made on intrinsic materials indicate that electron mobility increases with decreasing excitation frequency. Additional measurements made on devices indicate no systematic change in hole properties with frequency, and thus the conduction band is the main material property affected by excitation frequency. Device performance is found to be very sensitive to exposing the incomplete structure to the atmosphere between layers. Further, the n-i interface is found to be sensitive to the frequency at which the intrinsic layer is deposited. The implications of these observations to device fabrication technology are discussed. (no refs.)

63689 Electrodeposited CdS/CdTe heterojunction solar cells. B.M.Basol, R.L.Rod, E.S.Tseng (Monosolar Inc., Santa Monica, CA, USA). Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.719-26.

The latest in a series of solar cells made using electrochemical deposition is the CdS/p-CdTe heterojunction described here. The two ultrathin polycrystalline active layers were electrodeposited to yield cells with an efficiency of 7% over 0.2 cm² area. Best observed solar cell parameters were V_{oc}=0.79 V, J_{sc}=18.8 mA/cm² and F.F.=0.56 under illumination of 100 mW/cm². An improved window material should increase the efficiency of this potentially low-cost cell. (17 refs.)

63690 Thin film heterojunction CdS/Cu ternary alloys solar cells with minority carrier mirrors. M.Kwiatniak, J.J.Loferski, R.Beaulieu, R.R.Arya, E.Vera (Div. of Engng., Brown Univ., Providence, RI, USA), L.Kazmerski. Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.727-31.

A new concept in the fabrication of thin film solar cells with a multilayer structure in which they base region contains a minority carrier mirror (MCM) is reported. The theory of heterojunctions employing CdS as a wide bandgap window and layers of CuInSe₂ and CuGaSe₂Te_{1-x} with MCM as the photovoltaically active semiconductor is presented. A first cell of this type was made by RF-sputtering the successive layers; its AMI efficiency was about 4%. (6 refs.)

63691 Large area CdS/Cu₂S thin film solar cells produced by electrophoretic deposition. T.J.Cumberbatch, I.D.McNally, E.W.Williams, D.J.Gibbons, M.Claybourn, H.Clou, P.M.G.Dickinson (Central Res. Labs., Thorn EMI plc, Hayes, England), R.Hill, N.M.Pearsall, J.Woods, G.Russell, P.C.Pande.

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.732-6.

Electrophoretic deposition can be used to deposit large area thin films of CdS or ZnCdS/Cu₂S thin films have also been prepared. This technique has significant advantages over more conventional procedures with deposition rates of up to 3 μm min⁻¹ achieved. Recrystallisation of the as deposited powder layer is necessary and has been achieved using both laser and thermal treatments. A pulsed dye laser has also been used to aid the formation of heterojunctions prepared by a number of vacuum and non vacuum techniques. Preliminary results from these heterojunctions are outlined. (5 refs.)

63692 Sprayed zinc-cadmium sulfide films for backwall Cu₂S/(ZnCd)S cells. V.P.Singh, M.C.Bost, J.F.Jordan, D.M.Spitzer, Jr. (Photon Power Inc., El Paso, TX, USA).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.737-41.

Zn_xCd_{1-x}S films (0<x<0.5) were spready on tin oxide coated glass. Film thickness showed little variation with x; resistivity increased exponentially with x. Cu₂S/Zn_xCd_{1-x}S cells formed on these films were found to have much lower J₀, higher Voc and α, and lower Jsc than their CdS counterparts. Also, the spectral response of their short-circuit current was more sensitive to the white light bias than that of the Cu₂S/CdS cell. Photocapacitance showed a quenching band around 900 nm which accompanied an enhancement band for the Voc. (14 refs.)

63693 Large area and high efficiency a-Si:H solar cell. Y.Higaki, M.Kato, M.Aiga, Y.Yukimoto (LSI R&D Lab., Mitubishi Electric Corp., Hgjo, Japan).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.745-8.

A conversion efficiency of 5.4% for a-Si:H solar cell on 10×10 cm² stainless steel substrate has been obtained. Large area a-Si:H solar cells were fabricated by the C-coupled (60×60 cm² parallel plates) glow discharge method. The stainless steel substrate were polished down to 0.2 μm maximum roughness. Boron concentration profile was measured by IMA technique. The inverted (nip/s.s) configuration is superior to normal (pin/s.s) type for a-Si:H solar cell, since boron atoms likely pile up at the interface between the substrate and the a-Si:H even though B₂H₆ gas is not introduced. The undesirable boron atoms seem to come from the susceptor or the side wall of the reaction chamber, which cannot be etched out easily. Power dissipation at the transparent conducting film, at the comb electrode, and at the bus electrode on this large area solar cell were calculated respectively. It was concluded that the loss at the bus electrode is the largest and with the reduction of its resistance, the cell performance would be improved. As a result, Voc of 0.85 V, Jsc of 11.5 mA/cm², F.F. of 0.554 and efficiency of 5.4% have been obtained. (no refs.)

63694 Stability of amorphous silicon solar cells with pin structure. W.Kruhler, M.Moller, H.Pfleiderer, R.Plattner, B.Rauscher (Res. Lab., Siemens AG, Munich, Germany).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.754-8.

Solar cells made from hydrogenated amorphous Silicon with pin structure show an efficiency of up to 7.4% on 6 mm² and up to 5% on 2"×2". Degradation experiments with illumination and under forward bias in the dark, were performed. These measurements as well as capacitance and spectral response measurements show, that optically or electrically injected carriers induce recombination enhanced defect reactions, which lead to an increase of the density of states and, respectively, to a decrease of the ur-product, mainly of that of the holes. Compensation of the normally n-type i-layer by doping with Boron leads to higher cell stability due to a shifting of the Fermi level closer to midgap. The effect of different concentrations of Boron in the i-layer on its dark and photoconductivity was investigated. A maximum of photoconductivity is seen for 5 ppm. Preliminary tests on cells suggest, that the degradation can be minimized by a controlled Boron concentration of the i-layer. (7 refs.)

63695 Carrier conduction in a-Si:H solar cells. M.K.Han, P.Sung, R.Lahri, W.A.Anderson (Dept. of Electrical & Computer Engng., State Univ. of New York, Amherst, NY, USA).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.759-63.

The conduction process in a-Si:H Schottky structures (I-N⁺/SS) is found to be barrier controlled at low forward bias (<0.2 V) and bulk controlled at large forward bias (>0.6 V). The i-layer shows evidence of space charge limited current conduction (SCLC) in the dark. A model incorporating these considerations has been presented to develop equations for the terminal I-V characteristics of these structures. Dark I-V characteristics of the P-I-N structure are also explained on the basis of the above model. Dark C-V characteristics of the Schottky structures also support the existence of SCLC conduction in these structures. (7 refs.)

63696 Optical optimization of amorphous silicon solar cells. W.den Boer, R.M.van Strijp (Dept. of Electrical Engng., Delft Univ. of Technol., Delft, Netherlands).

Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.764-8.

A computer simulation study is presented to calculate the optical behaviour of thin film solar cells. Application to Schottky-barrier a-Si:H solar cells with highly reflective back contacts indicates that multiple reflections are strong for long wavelength light and can be used to improve the efficiency. Relative maxima in the AMI integrated absorption occur at certain a-Si:H film thicknesses. For a given cell configuration the optimum antireflection coating is calculated. For weakly absorbed monochromatic radiation the electron-hole pair generation rate varies periodically with distance from the front contact due to interference. Integrated over the solar spectrum interference peaks in the generation rate are reduced, but remain present near the back contact. The computer program can be easily adapted for calculations on p-i-n cells, tandem cells and multi-junction cells. (7 refs.)

- 63697 Large area hydrogenated amorphous silicon for photovoltaic application.** G.J.Smith, W.I.Milne (Cambridge Univ., Cambridge, England), P.Blackborow.
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.769-72.
Satisfactory production techniques for depositing hydrogenated amorphous silicon (a-Si:H) over large area remain to be developed. This paper reports the manufacture of uniform films of a-Si:H by glow discharge of silane over an area 60 cm in diameter. Electrical and optical properties and film quality are discussed. (6 refs.)
- 63698 Antimony doping in vacuum deposited thin film silicon photovoltaic cells.** C.Feldman, F.G.Satkiewicz, N.A.Blum, K.G.Hoggarth (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.783-7.
A method for antimony doping silicon polycrystalline thin films and single crystals has been investigated. The method is compatible with the concept of forming photovoltaic cells completely in a vacuum system. Layers of Sb_2O_3 and Si were deposited either simultaneously or sequentially through masks onto the silicon surface. Heating (e.g. 1100°C , 1 hr) in either an inert atmosphere or oxygen brought about the formation of an SiO_2 -Sb glassy layer and caused Sb to diffuse into the base silicon surface. The oxide complex is then etched off leaving n-type regions of the surface. Reactions of the layers were examined by secondary ion mass spectrometry and X-ray diffraction. (6 refs.)
- 63699 Photovoltaic performance of CdS heterojunctions on polycrystalline silicon.** E.Scafe, G.Maletta, R.Tomaciello, P.Alessandrini, A.Camanzi, L.de Angelis, F.Galluzzi (Lab. Ricerche Assorini, Monterotondo, Roma, Italy).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.788-92.
New results on photovoltaic performance of n-CdS/p-Si heterojunctions are reported. Conversion efficiencies up to 11.1% for single crystal Si and 9.2% for semi-crystal Si have been obtained (without ARC and BSF) by a systematic study of CdS film doping, Silicon substrate preparation and interfacial oxide thickness. (5 refs.)
- 63700 Temperature dependence of the IV-characteristic of Cu₂S-CdS thin film solar cells and related phenomena.** G.H.Hewig, F.Pfisterer, H.W.Schock (Inst. fuer Phys. Elektronik, Univ. Stuttgart, Stuttgart, Germany).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.793-7.
The temperature dependence of the IV-characteristic of Cu₂S-CdS solar cells in the dark and under various illumination conditions has been measured in the range -100 to $+100^\circ\text{C}$. The major findings are: (1) Cells processed in different ways exhibit different temperature dependences of the IV-characteristics. (2) The temperature dependence is influenced in different ways by illuminating the cells with varying monochromatic light. (3) Cells showing a strong light-effect also show a strong temperature dependence of the IV-characteristics. The population density of copper levels in the CdS region adjacent to junction is a function of temperature and of illumination and causes variation of the field strength and of the interface recombination velocity at the metallurgical junction. These mechanisms are responsible for the observed effects. (8 refs.)
- 63701 Comparison between various ion beam doping procedures and anneal techniques used in manufacturing silicon solar cells.** J.C.Muller, A.Meshi, P.Siffert (CRN, Strasbourg, France), J.Com-Nougue, C.Tessari, Jp.Dumas.
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.994-8.
Conventional ion implantation of phosphorus and ion incrustation (non mass separated PF_5 molecular ions), have been used to realize the N^+ layer of single crystalline silicon solar cells. Various regrowth techniques have been investigated: classical thermal treatment, laser annealing in the liquid and solid phase regimes and electron beam annealing. A systematic investigation by DLTS has allowed the determination of the optimal conditions of the post thermal treatment. Finally, large scale cells ($\geq 10\text{ cm}^2$) that have been prepared by using industrial processes and efficiencies higher than 13% have been measured for the two doping procedures. These techniques are presently applied to polycrystalline silicon from various sources. The first results obtained on solar cells elaborated with these materials, in particular the silicon under development at Laboratoire de Marcoussis are given. (12 refs.)
- 63702 Status of ion-implanted silicon solar cells.** W.Schmidt, K.-D.Rasch (AEG-Telefunken, Heilbronn, Germany).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.999-1006.
Ion implantation is considered as a possible low-cost 'cold' process for junction formation in terrestrial solar cell fabrication. But it requires a subsequent implantation damage annealing step. Various annealing techniques as thermal treatment or irradiation with laser or electron beams have been applied. The results indicate for all annealing techniques lower efficiencies compared with standard diffused cells. The problems of annealing are discussed. The influence of a post-anneal heat treatment and of resistivity on the performance of pulsed electron beam annealed cells is evaluated. (13 refs.)
- 63703 Optimization of pulsed electron beam annealing process for silicon solar cells.** A.Laugier, D.Barbier, G.Chemisky (Inst. Nat. des Sci. Appl. de Lyon, Villeurbanne, France).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.1007-12.
Ion implanted silicon solar cells characteristics are related to pulsed electron beam annealing parameters (PEBA). Evolution of electron beam energy deposition profile versus charging voltage and plasma field emission diode geometry is studied. By computer simulation of thermal effects it is shown that molten depth and liquid phase duration can be adjusted to yield the best ion implanted junction characteristics. Effect of heating Si wafers above 400°C before pulsing is investigated. SIMS profiling is used to determine junction profiles after PEBA in (100) phosphorus implanted silicon. PEBA solar cells characteristics are presented. (6 refs.)
- 63704 Silicon solar cells by ion implantation: E-beam and self annealing.** G.F.Cembali, R.Galloni, G.Lulli, A.Mazzone, P.G.Merli, R.Nipoti (CNR, Istituto LAMEL, Bologna, Italy), F.Zignani.
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.1013-17.
Two different techniques, based on ion implantation, have been experimented to obtain solar cells: a) ion implantation followed by electron beam annealing, b) self-annealed ion implantation. Silicon single crystals have been used to get a better understanding of the processes. In all cases radiation damage is annealed by a solid phase process. Solar cells tested at AM1.5 show efficiencies between 13 and 13.5% which may be compared with a 15% AM1.5 efficiency obtained by ion implantation and furnace annealing. Experimental results are compared with data obtained from a computer simulation to evaluate emitter tailoring effects. A new electron gun especially designed and set up for annealing purpose is presented. (6 refs.)
- 63705 An automated ion implant/pulse anneal machine for low cost silicon cell production.** A.J.Armini, S.N.Bunker, M.B.Spitzer (Spire Corp., Bedford, MA, USA).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.1018-22.
The continuing development of a high throughput ion implanter and a pulsed electron beam annealer designed for dedicated silicon solar cell manufacture is reviewed. This equipment is intended for production of junctions in 10 cm wide wafers at a throughput up to 10 MW_p per year. The principal features of the implanter are the lack of mass analysis and defocusing utilizing electrostatic deflection. The implanted surface is annealed by liquid phase epitaxy resulting from a single burst of a large area electron beam. Cells with non-mass analyzed ion implantation have yielded AM1 cell efficiencies in excess of 15%. Pulse annealed Czochralski cells have been made with AM1 efficiencies of 13% vs. 15% for a furnace annealed group. J_{sc} is 3-4% higher for pulse annealing; V_{oc} is usually lower. Results of pulse annealing of polycrystalline materials indicate that cell performance comparable to diffusion can be obtained. (10 refs.)
- 63706 Laser processing in the preparation of high efficiency polycrystalline silicon solar cells.** E.Courcelle, E.Fogarassy, J.C.Muller, P.Siffert (CRN, Strasbourg, France).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.1023-8.
Two doping processes, based on the use of high power lasers as surface localized energy sources have been employed to realize the junction on P-type polycrystalline silicon, prepared by a case technique (Wacker). These are non mass separated ion implantation, the ions being generated from PF_5 , and laser induced diffusion of Sb deposited on surface. Annealing involves either a Q-switched pulsed Ruby laser ($\lambda=0.69\text{ }\mu\text{m}$, $E=1.5\text{ J/cm}^2$) providing a larger area beam (0.8 mm) or a repetitively Q-switched, CW pumped YAG ($\lambda=0.53\text{ }\mu\text{m}$, $E=2.5\text{ J/cm}^2$) laser focused on 100 microns diameter spots scanned on large area. The properties of the doped layers have been investigated and compared to that of single crystalline silicon handled in the same way. The characteristics of solar cells were studied as a function of various parameters, such as ion implantation conditions, thickness of the dopant layers and effect of post laser thermal treatments. Cell performances under AM1 conditions are rather promising, since efficiencies up to 11% have been achieved on large grained cast silicon for large area cells. (8 refs.)
- 63707 The influence of surface texture and thermal treatment on the performance of laser-annealed silicon solar cells.** W.Sinke, D.Hoonhout, F.W.Saris (FOM-Inst. for Atomic & Molecular Phys., Amsterdam, Netherlands).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.1029-33.
Single-crystal silicon cells have been made by shallow, mass-analyzed ion-beam implantation followed by Q-switched ruby-laser annealing. The influence of surface texture of the substrate, and of a thermal treatment at 400°C or 600°C during 40 min. either prior to, during or after pulsed-laser annealing on the performance of the cells has been studied. Structure and composition of implanted and annealed silicon have been investigated by Rutherford backscattering and channeling. Solar cell performance was characterized by measuring the I-V-curve. It was found that texturized surfaces are very prone to laser-induced damage as compared to non-texturized or polished surfaces. Treating the implanted silicon wafers to 400°C during pulsed-laser-annealing results in improved open-circuit-voltage, with respect to laser-annealing without substrate-heating. (5 refs.)
- 63708 Implantation of boron and boron fluoride compounds into silicon for production of solar cells.** A.Nylandsted Larsen, F.Nielsen, G.Sorensen (Inst. of Phys., Univ. of Aarhus, Aarhus C, Denmark).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.1034-8.
The effects of pulsed laser irradiation on single crystalline silicon implanted with mass-separated B, BF, BF_2 , and BF_3 have been studied by channeling transmission electron microscopy, and sheet resistivity measurements. It is shown that a high implantation dose of fluorine in the surface layer causes a decrease in the threshold energy density for recrystallization. Low sheet resistivities before recrystallization is also found to correlate to the fluorine concentration. (9 refs.)
- 63709 Grain boundary photocurrent enhancement in solar cells made by laser diffusion.** G.B.Turner, D.Tarrant, D.Aldrich (Arco Solar Inc., Chatsworth, CA, USA), R.Pressley, R.Press.
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.1039-43.
An enhanced photocurrent has been observed at grain boundaries in solar cells made by Gas Immersion Laser Diffusion (GILD). Wafers of Wacker 'Silso' polycrystalline material were sliced from the cast block, kept in order, and subjected to different treatments. Many grain boundaries extended through three wafers. One wafer was furnace-diffused with phosphorus (850°C , 1 hr) and the next was made by the GILD method. A third wafer was heat treated, without dopant, the same as the furnace-diffused cell. Laser photocurrent scans show that many grain boundaries degrade photocurrent in cells that have been heat treated but enhance it slightly in GILDed cells. Photocurrent scans on the backs of the cells show the effect strongly amplified. Two models are presented which are consistent with these results. (4 refs.)
- 63710 Dry process for economic cell manufacturing.** J.Donon, H.Lauvray, P.Aubril, G.David, P.Loubly (Photowatt Internat. SA, Caen, France).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.1044-8.
Different dry processes for cell manufacturing are under development leading to important cost reduction: plasma etching in order to remove the thin damaged layer induced during sawing with a wire saw, to etch away the oxide layer after diffusion and to open the junction on the edges, general use of screen printing in order to obtain N^+/P and $\text{N}^+/\text{P}/\text{P}^+$ structures with screen printed doping sources, to print front and back contacts (silver can be

used for the front, aluminium and silver for the back with the possibility of diffusing through the oxide and the junction when needed), to deposit the AR coating, either at the end of the process or during the junction formation. The main advantages of these dry processes using plasma etching and screen printing are: low material consumption, high throughput versus capital investment ratio, little pollution, automation capability. A preliminary economic analysis is made to show the interest of using such a process in production capacity. (no refs.)

63711 Low-cost structures and optimization of support structures.

J.Glockl, P.Helm, K.Trader.
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.1050-2
Presents a newly developed low-cost support structure for PV panels based on elements commonly used for fence construction. Thereafter trade-off methods to arrive at an optimization in terms of total costs for support structures have been described. (no refs.)

63712 Screen printed SIS-type solar cells.

J.N.Avaritsiotis (Univ. of Athens, Dept. of Phys., Athens, Greece), D.S.Campbell, C.Caroubalos.
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.1053-5
The experimental results of a feasibility study that has been under-taken in order to investigate the potentiality of the thick film technology in the fabrication of ITO-single crystal Si solar cells, are discussed. Newly developed thick film pastes, in use in the optoelectronics industry have been tried. In this structure the ITO thick film acts not only as a conducting surface layer that induces the SIS junction but also as an antireflective coating. Promising cells were fabricated employing conventional thick film apparatus that is widely used in the microelectronics industry, showing a $V_{oc}=310$ mV and a $J_{sc}=1$ mA/cm², under a total insolation of 613 W/m². Further work is necessary for the optimisation of the cell parameter. (7 refs.)

63713 An improved derivation of solar cell parameters in terms of transition probabilities.

P.T.Landsberg (Univ. of Southampton, Southampton, England).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.1056-8
Using rate equation and quasi-chemical potentials, the relation $j=j_L-j_{rev}[\exp(qV/KT)-1]$ is obtained. It yields identifications for j_L and j_{rev} in terms of radiative and non-radiative transition probabilities per unit time. (3 refs.)

63714 The world's largest 12 volt single string photovoltaic module.

P.Lauwers, G.R.Smekens.
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.1063-4
Presents the world's largest nominal 12 Volt single string photovoltaic module ever made until today. It is a 1 m 2 module consisting of 40 semicrystalline cells, each 15 cm by 15 cm. The module delivers 72 Watt under 1000 W/m², AM-1.5 illumination. The results listed here are those of a first batch of 100 wafers processed from starting material to encapsulated module. (no refs.)

63715 Light assisted pulsed annealing of photovoltaic silicon by microwave energy.

P.Chenevier, J.Cohen, G.Kamarinos (CNRS, Enserg, Grenoble, France).
Fourth E.C. Photovoltaic Solar Energy Conference. Proceedings of the International Conference, Stresa, Italy, 10-14 May 1982 (Dordrecht, Netherlands: Reidel 1982), p.1065-7
Recommends a new method of pulsed annealing using microwave energy. This method allows annealings of sufficiently short duration (on the order of 100 ms) to operate in an ordinary clean room ambience, and to treat relatively large areas. Moreover, the total energy efficiency is far higher (up to 20 to 30%) than with a laser or electron beam. In addition, microwave generators also allow profiling the power pulse, so that the treatment can be accurately controlled. (no refs.)

63716 Temperature effect on phenosafranine-EDTA photogalvanic cell.

K.K.Rohatgi-Mukherjee, M.Bagchi, B.B.Bhowmik (Phys. Chem. Lab., Jadavpur Univ., Calcutta, India).
Electrochim. Acta (GB), vol.28, no.3, p.293-300 (March 1983).
The photogalvanic effect in phenosafranine-EDTA aqueous solution has been studied in deoxygenated solutions using platinum electrodes for both chambers, illuminated and dark, at different temperatures. For temperature variations between 20 and 49°C, the values of open circuit photovoltage V_{oc} change from 543 to 870 mV and that of steady state photocurrent I , from 1.58 to 3.24 μ A. The present results show that with increasing temperature the photovoltage and photocurrent increase linearly, the time to attain both the equilibrium values also diminishes gradually. Photovoltage and photocurrent appear only in unstirred solutions. An attempt has been made to analyse the effect of pH, light intensity and solvent to understand the temperature dependence of photovoltage. Power conversion efficiency is only 0.24 μ W

cm⁻² and solar energy efficiency 10⁻³%. The current-potential curve indicates high activation overpotential responsible for low efficiency of the cell. Calculation of thermodynamic parameters show large negative entropy for cell reaction. (18 refs.)

63717 Ceramic SrTiO₃ photoanodes: enhancement of photoactivity through donor doping.

B.Odekirk, J.S.Blakemore (Oregon Graduate Center, Beaverton, OR, USA).
J. Electrochem. Soc. (USA), vol.130, no.2, p.321-6 (Feb. 1983).
Results are reported for the photoactivity of lanthanum-doped, strongly reduced SrTiO₃ in microcrystalline ceramic form. Photoanodes of La_xSr_{1-x}TiO₃ (with x up to 0.01) were used in photoelectrochemical cells with simulated AM2 solar illumination, and aqueous electrolytes of various pH. The photoresponse was highest for strongly basic electrolytes, and 1M NaOH was used for subsequent experiments. Samples with heavy doping and strong reduction (heated at 1325K with $P_{O_2} \leq 10^{-18}$ atm, and quenched) showed good photoactivity without external bias. Impurity band formation for $x \geq 0.003$ provides an extension of the spectral response to longer wavelengths, and improves the quantum efficiency. Weakly doped samples ($x \leq 0.002$) show a modest photo-oxidation after operation in a PEC cell for several hours, but this feature is absent for large doping. No significant photodecomposition effects were seen after operation at AM2 illumination for up to 50 hr. (30 refs.)

63718 Photocathodic reactions at p-InP.

K.Uosaki, H.Kita (Dept. of Chem., Hokkaido Univ., Sapporo, Japan).
Sol. Energy Mater. (Netherlands), vol.7, no.4, p.421-9 (Jan.-Feb. 1983).
The photocurrent-potential and the capacitance-potential relations are determined for p-InP in 1 M NaOH and in 0.5 M H₂SO₄. Hydrogen evolution is the main photocathodic reaction in 1 M NaOH but a significant amount of the current leads to In deposition in 0.5 M H₂SO₄. The Tafel-like behaviour of the photocurrent-potential relation, the non-linear relation between the photocurrent and the light intensity and the photocurrent enhancement by addition of an easily reducible compound (methyl viologen) all suggest that a surface process controls the rate. Inversion layer formation is inferred from the Mott-Schottky plots. (17 refs.)

63719 Factors affecting the efficiency of chemically deposited CdSe based photoelectrochemical cells.

R.C.Kainthla, J.F.McCann, D.Haneman (School of Phys., Univ. of New South Wales, Kensington, NSW, Australia).
Sol. Energy Mater. (Netherlands), vol.7, no.4, p.491-500 (Jan.-Feb. 1983).
CdSe thin films have been deposited on titanium, nickel and stainless steel substrates by a chemical deposition technique from an aqueous solution of cadmium acetate, ammonia and sodium selenosulfate. The effects of film thickness, substrates and annealing temperature in air on the performance of CdSe based photoelectrochemical cells have been studied. Open-circuit voltages up to 728 mV have been obtained for film deposited on nickel substrates. By optimising deposition and post deposition conditions, for Ni and Ti substrates efficiencies up to 5.5% have been obtained on small (1 cm²) cells. (15 refs.)

63721 Performance comparison of 15- and 165-tpd Texaco coal gasifiers.

G.N.Richter, J.S.Stevenson, L.S.Hollingsworth.
Report EPRI-AP-2814, Electr. Power Res. Inst., Palo Alto, CA, USA (Jan. 1983), 36 pp.
Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA.
Presents the results of steady-state tests that were conducted at the Texaco Montebello 15-tpd coal gasification pilot plant. An analysis of several conditions is made, and these results, presenting representative performance information, are compared with those obtained at Ruhrkohle/Ruhrchemie's 165-tpd demonstration plant in order to obtain gasifier scale-up data. Qualitative results are also given of parametric tests conducted to determine the influence of Serox operating variables on H₂S, COS and CO₂ removal from the syngas.

86.30R Thermal energy conversion (heat engines and heat pumps)

63722 Development of a metal hydride compressor.

K.Nomura, E.Akiba, S.Ono (Nat. Chem. Lab. for Industry, Ibaraki, Japan).
J. Less-Common Met. (Switzerland), vol.89, no.2, p.551-8 (Feb. 1983).
(International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).
The National Chemical Laboratory for Industry (NCL) model 4 chemical engine has been completed. This is a type of hydrogen compressor using LaNi₅ as the energy conversion medium. The container, consisting of 19 copper tube elements with aluminium inner fins and covered with a stainless steel heat-insulated water jacket, is filled with 18.9 mol of LaNi₅. The compressor is composed of a pair of these containers, two electrical boilers (9 kW), a circulating pump, valves and other components. The container is able to absorb 1.3 m³ (at normal temperature and pressure (NTP)) of hydrogen, and the time needed for preheating (90°C) and cooling (27°C) is less than 3 min. In the present investigation, using this container, the basic operating characteristics such as the hydrogen-absorbing and hydrogen-desorbing ability, the thermal efficiency, the heat transfer coefficient and the reaction velocity have been examined. Because of the circulating hot water (90°C: 30 l min⁻¹), the NCL model 4 compressor is able to desorb 360 l min⁻¹ (NTP) of high pressure (18-12 atm) hydrogen gas continuously in 3 min. However, this is its maximum ability under stable conditions. The overall heat transfer coefficient estimated is about 300-1200 kcal m⁻² h⁻¹ °C⁻¹. Using a plunger

pump, the NCL model 4 compressor has been combined with a reverse osmosis type of desalination apparatus, and a practical test is now under way. (5 refs.)

63723 Coefficients of performance of hydride heat pumps. T.Nishizaki, K.Miyamoto, K.Yoshida (Central Res. Lab., Sekisui Chem. Co. Ltd., Osaka, Japan).

J. Less-Common Met. (Switzerland), vol.89, no.2, p.559-66 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).

A model for calculating the coefficients of performance (COPs) is presented for a chemical heat pump which contains two metal hydrides and which consists of four reactors. Two reactors contain the first metal hydride MH_1 and the other two contain the other metal hydride MH_2 . A concept of the sensible heat exchange between the reactors containing the same hydride is introduced into the model as one of the means of improving the COP. The dependence of the COP on the various design parameters is discussed. The results of the numerical calculation show that a sufficiently flat plateau, low reactor heat capacities and a highly efficient sensible heat exchange are essential to the achievement of a high COP. (5 refs.)

63724 High performance evacuated solar collectors—design, applications and viability. G.L.Harding, B.Window (School of Phys., Univ. of Sydney, Sydney, NSW, Australia), R.Gammon.

Int. J. Ambient Energy (GB), vol.3, no.4, p.171-80 (Oct. 1982). [received: March 1983]

The design of evacuated collectors developed in various laboratories is reviewed and the research and development work on an all-glass evacuated collector at the university is discussed in detail. Long-term comparative test data for flat plate and evacuated collectors and the projected economics of large volume manufacture of all-glass collectors indicate the viability of evacuated collectors for applications such as domestic water heating. (16 refs.)

63725 Using solar energy to heat water in low income housing. J.A.Basson (Nat. Building Res. Inst., Pretoria, S Africa).

Int. J. Ambient Energy (GB), vol.3, no.4, p.187-94 (Oct. 1982). [received: March 1983]

The Institute originally developed a pipe type integral solar water heater for use in low income dwellings. This design was subsequently adapted to suit manufacturing procedures and utilise more durable materials. The integral unit is relatively inexpensive and simple to install and operate. Its solar efficiency is high but the water in the unit cools during the night. The integral unit is inherently frost-resistant in a mild winter climate because of the large waterways and small exposed surface area. Units currently available are water and hail resistant and of durable construction. (8 refs.)

63726 Planar solar reflectors. H.F.Chiam (Res. Dept., ICI Australia Operations Pty Ltd., Melbourne, Victoria, Australia).

Int. J. Ambient Energy (GB), vol.3, no.4, p.195-202 (Oct. 1982). [received: March 1983]

A planar reflector is preferred to curved alternatives as a concentrating or augmenting device for a flat-plate solar collector. The performance characteristics of a reflector-augmented collector are reviewed. Particular emphasis is placed on the practical application of the principal results to single reflector and V-trough systems. The usefulness of highly reflective, horizontal diffuse surface to a tilted collector, and the comparative performance of a faceted reflector containing two planar segments are also discussed. (6 refs.)

63727 The effect of design parameters on thermal efficiency of collector storage wall passive systems. D.Tinaut, E.Tasdemiroglu, F.Ramos, F.Hernandez (Inst. de Optica 'Daza de Valdes', Madrid, Spain).

Opt. Pura & Apl. (Spain), vol.15, no.3, p.143-6 (1982).

The thermal performance of Trombe-Wall is studied in detail and the energy transfer fractions are calculated by computer simulation. The program is based on analytically developed correlations, the input data being measured values recorded within the period of one year. The annual variation of energy flow through the thermal wall into the building is represented by efficiency curves. From these efficiency curves, obtained as functions of both the specific construction characteristics and environmental conditions, it is possible to predict the amount of energy saving of passive system and also to determine the percentage of radiation, convection and natural thermocirculation rates. (4 refs.)

63728 Composition, optical properties and degradation modes of Cu/graded metal-carbon solar selective surfaces. S.Craig, G.L.Harding (School of Phys., Univ. of Sydney, Sydney, NSW, Australia).

Thin Solid Films (Switzerland), vol.101, no.2, p.97-113 (11 March 1983).

A detailed study is reported of the composition and properties of a production Cu/graded stainless steel-carbon selective surface which is incorporated in all-glass evacuated solar thermal collectors. The Auger depth profile, reflectance for wavelengths in the range 0.35-2.5 μm and temperature-dependent emittance for the range 100-300°C were determined for the selective surface before and after heat treatment of the collector at 500°C. The composition, carbon atom bonding states, electrical resistivity, refractive indices (wavelengths, 0.35-2.5 μm), IR transmittance (wavelengths, 2.5-16 μm) and emittance (100-300°C) for a set of homogeneous stainless steel-carbon component layers of the graded layer profile were also determined before and after heat treatment. In addition, a multilayer stack computer model based on the composition profile of the production selective surface and the comprehensive refractive index data for the set of homogeneous component layers was developed. Correlation of the experimental data for the set of homogeneous layers with alterations in reflectance for the multilayer stack resulting from the substitution or removal of component layers in the stack allowed a detailed evaluation of the factors determining production selective surface properties before and after heat treatment. A theoretical study of alternative grading profiles with a view to optimizing the solar selective properties of the surface is also discussed. (32 refs.)

63729 Optimization and microstructural analysis of cobalt-sulfide-pigmented aluminum oxide. A.Scherer, O.T.Inal (Dept. of Metall. & Materials Engng., New Mexico Inst. of Mining & Technol., Socorro, NM, USA).

Thin Solid Films (Switzerland), vol.101, no.4, p.311-28 (25 March 1983).

Porous anodic films formed on aluminum in a phosphoric acid electrolyte were used to develop selective solar coatings by double precipitation of cobalt acetate and ammonium sulfide inside the pores. The black coatings containing cobalt sulfide were then sealed in hot water and their optical, mechanical and thermal degradation properties were tested. Multiple linear regression routines were used to optimize the absorbance and emittance values and the coating formation conditions were accordingly adjusted. After optimization, the coatings were characterized by scanning and transmission electron microscopy, and thermal stability tests were performed to determine the long-term quality

of the coatings. The coatings were found to have good thermal stability up to 150°C and high adhesion strength as well as absorbances of up to 0.965 at emittances ranging from 0.15 to 0.25. (15 refs.)

63730 Results and analysis of a round robin test series using solar simulators. J.E.Moon.

Report EUR 8006 EN, Comm. European Communities, Luxembourg (1982), 53 pp. Contract ESA-G-047-UK(N).

This round robin test series using solar simulators was performed as part of a collaborative programme co-ordinated by the Commission of the European Communities to assess and develop methods of testing solar collectors within the European Community. Eight laboratories, representing seven E.C. Countries, have undertaken thermal performance tests on the Dutch (DRU) flat plate collector in their solar simulators. These results have been analysed and are presented individually for each laboratory and also collectively. As part of the analysis, the measured data has been adjusted to allow for differences in the environmental test conditions between laboratories. Conclusions are drawn which will form the basis for recommendations on testing solar collectors in solar simulators to be documented and included in the next edition of the 'CEC Recommendations for European Solar Collector Test Methods' (to be published in 1983). (5 refs.)

63731 Compressed-air energy storage: Commercialization potential and EPR roles in the commercialization process. D.W.Boyd, O.E.Buckley, E.C.Clark.

Report EPR-EM-2780, Electr. Power Res. Inst., Palo Alto, CA, USA (Dec. 1982), 160 pp.

Available from Res. Rep. Center, Box 50490, Palo Alto, CA 94303, USA. Describes an assessment of potential roles that EPR might take to facilitate the commercial acceptance of compressed-air energy storage (CAES) systems. Detailed analyses of the market potential of utility storage technologies are provided, and interviews with representatives of key participants in the CAES market are presented. A decision analysis synthesizing much of the information about market and technology status is given.

86.40F Storage in thermal energy

63732 Development of thermal energy storage technology using metal hydrides. I.Yonezu, K.Nasako, N.Honda, T.Sakai (Res. Centre, Sanyo Electric Co. Ltd., Osaka, Japan).

J. Less-Common Met. (Switzerland), vol.89, no.2, p.351-8 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).

The rate of heat transfer is important in heat storage technology using metal hydrides because the rate of hydrogen transfer depends on the rate of heat transfer. A new metal hydride container with heat pipes which were able to transfer heat rapidly was constructed and was used to operate the heat storage system with a hydrogen flow of 1.5 l min⁻¹ between 3.5 kg beds of CaNi_2 and LaNi_2 . The metal hydride beds were located inside cylindrical heat pipes 66 cm long with an inside diameter of 4 cm. (2 refs.)

63733 Dynamic characteristics of a hydride heat storage system. M.Kawamura, S.Ono (Nat. Chem. Lab. for Industry, Ibaraki, Japan), Y.Mizuno.

J. Less-Common Met. (Switzerland), vol.89, no.2, p.365-72 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).

An Mg_2Ni hydride heat storage system for a batch polymerization reaction was designed and manufactured and its performance was investigated experimentally. A theoretical model to describe the dynamic characteristics of the hydride heat storage (HHS) system was also developed. The model predictions are in good agreement with the experimental performance of the HHS system. The temperature gain of the heat transfer medium depends strongly on the heat transfer area, the flow rate of the heat transfer medium and the heat transfer coefficient. (3 refs.)

63734 Light-induced generation of hydrogen at CdS-monograin membranes. D.Meissner, R.Memming, B.Kastening (Inst. fur Phys. Chem., Univ. Hamburg, Hamburg, Germany).

Chem. Phys. Lett. (Netherlands), vol.96, no.1, p.34-7 (25 March 1983).

A new kind of membrane consisting of small particles of single-crystalline CdS embedded in a polymer film is described. In various photoelectrolysis experiments the properties of the membrane which separates a cell in two compartments were investigated. Relatively large quantities of H_2 were produced in the presence of an electron donor such as S^{2-} ions or EDTA and small quantities by direct photoelectrolysis of H_2O . This technique gives information on the role of catalysts deposited on one or both faces of the membrane. (15 refs.)

63735 A technique for analyzing reversible metal hydride system performance. P.M.Golben, E.L.Huston (Ergenics Div., MPD Technol. Corp., Wycokoff, NJ, USA).

J. Less-Common Met. (Switzerland), vol.89, no.2, p.333-40 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).

An experimental method is described which permits rapid characterization of hydride modules without requiring internal measurement of the bed temperature. The time to charge or discharge is measured as a function of the hydrogen pressure. A pressure-to-temperature transformation which relies on reversible metal hydride thermodynamics is applied to determine the bed temperature. This transformation facilitates conventional heat transfer analysis on hydride modules. Results are presented for the charging of a 0.375 in (0.95

cm) tubular hydride module. The time to 90% charge is less than 5 min when the temperature difference between the LaNi_5 bed and the external cooling water exceeds 14°C . This result compares very favorably with laboratory reactors designed for rapid heat transfer. (18 refs.)

63736 A heat storage reactor for metal hydrides. S.Wakao, M.Sekine (Tokai Univ., Kanagawa, Japan), H.Endo, T.Ito, H.Kanazawa. *J. Less-Common Met. (Switzerland)*, vol.89, no.2, p.341-50 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).
A reactor for a metal hydride heat storage system is required to have good heat transfer properties and as small a heat capacity as possible because the heat produced during the metal-hydrogen reaction is finite and its loss must be minimized. However, few theoretical studies of heat storage reactors that use finite quantities of heat have been made. The transfer of the heat of reaction in the reactor was studied theoretically and experimentally and the results are summarized. The theoretical and experimental results agreed relatively well, so that the application of the fundamental concept proposed in this paper to the design of heat storage reactors using metal hydrides which produce finite quantities of heat is justified. (1 ref.)

63737 Hydrogen permeability of hydride powder during the heat generation stage. M.Kawamura, S.Ono (Nat. Chem. Lab. for Industry, Ibaraki, Japan), S.Higano, K.Kamino. *J. Less-Common Met. (Switzerland)*, vol.89, no.2, p.359-63 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).
The permeability characteristics of a hydride powder bed were examined experimentally. Powder movement, which was assumed to be due to backward and forward flow, was observed after a number of hydriding-dehydriding cycles. When the exothermic reaction was performed at high temperatures, a pressure drop between the end point and the filter pipe appeared; however, no such pressure drop was observed at room temperature, when no reaction occurred. It is shown that the development of equipment to reduce the pressure drop is of importance in the improvement of this novel heat storage system. (4 refs.)

63738 Hydrogen storage in thin film metal hydrides. H.Wenzl, K.-H.Klatt, P.Meuffels (Inst. für Festkörperforschung, KFA Jülich, Jülich, Germany), K.Papathanassopoulos. *J. Less-Common Met. (Switzerland)*, vol.89, no.2, p.489-94 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).
Sandwich films were prepared by vapour deposition on quartz crystals or polycrystalline aluminium foil, e.g. $\text{quartz}/\text{V}(1\ \mu\text{m})/\text{Pd}(100\ \text{nm})$ and $\text{Al}(20\ \mu\text{m})/\text{Pd}(100\ \text{nm})/\text{V}(10\ \mu\text{m})/\text{Pd}(100\ \text{nm})$. The vanadium films can be hydrided almost reversibly from the gas phase within seconds to $\text{VH}_{0.5}$ at 300K and a hydrogen pressure of 1 bar and within 1 min to $\text{VH}_{1.8}$ at 300K and a hydrogen pressure of 30 bar. The known phase diagrams of the V-H_2 system were reproduced. The $\text{Al}/\text{Pd}/\text{V}/\text{Pd}$ films were used in prototype hydrogen storage containers: a 2% mass fraction of hydrogen was stored, similar to TiFe hydride storage, but a much higher heat exchange rate was attained. (5 refs.)

63739 Life properties of Ti-Mn alloy hydrides and their hydrogen purification effect. T.Gamo, Y.Moriwaki, N.Yanagihara, T.Iwaki (Central Res. Lab., Matsushita Electric Industrial Co. Ltd., Osaka, Japan). *J. Less-Common Met. (Switzerland)*, vol.89, no.2, p.495-504 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).
The effects of pressure-induced absorption-desorption cycling on the degradation properties and the hydrogen purification ability of Ti-Mn alloy hydrides were studied. The lines in the characteristic X-ray diffraction pattern were much broader and weaker in the cycled alloys but the C14 hexagonal structure was maintained and no second phase was observed. The hydrogen capacity was reduced by 30% for Ti-Mn binary alloy and by 20% for Ti-Mn multicomponent alloys after about 10000 cycles in contrast with the marked reduction observed for LaNi_5 . In some cases slight recovery could be produced by heating at 500°C for 1 h in a vacuum after cycling. Gas chromatography measurements on hydrogen released from $\text{TiMn}_{1.5}$ hydride showed that the hydrogen purity was better than 99.9999% (except for an H_2O impurity) after a purge release of only a few per cent of hydrogen when the purity of the commercial grade hydrogen absorbed by the hydride was 99.99%. It can be concluded from the results of these measurements that hydrogen purification using Ti-Mn alloy is related to two factors. The removal of N_2 , CO and CO_2 proceeds by surface poisoning (i.e. oxidation, physisorption or chemisorption), whereas the removal of CH_4 , O_2 , H_2O and Ar is controlled by surface poisoning and concentration. The hydrogen purification effect of Ti-Mn alloy hydrides showed little degradation even after a large number of absorption-desorption cycles. (11 refs.)

63740 Hydrogen storage properties of FeTi_{1+x} and $\text{FeTi}_{1+x}\text{O}_y$ flakes produced by splat quenching. M.Amano, Y.Sasaki, R.Watanabe, M.Shibata (Nat. Res. Inst. for Metals, Tokyo, Japan). *J. Less-Common Met. (Switzerland)*, vol.89, no.2, p.513-18 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).
The splat quenching method was used to produce FeTi_{1+x} and $\text{FeTi}_{1+x}\text{O}_y$ flakes in order to simplify the pulverizing process. Batches (300-1000 g) of $\text{FeTi}_{1.22}$, $\text{FeTi}_{1.23}\text{O}_{0.007}$ and $\text{FeTi}_{1.24}\text{O}_{0.04}$ flakes 0.10-0.15 mm thick were produced using a rotating water-cooled disc after arc melting the constituent metals in an argon atmosphere. The hydrogen storage properties of the splat-quenched and annealed flakes were investigated. The powders obtained by pulverizing $\text{FeTi}_{1.22}$, $\text{FeTi}_{1.23}\text{O}_{0.007}$ and $\text{FeTi}_{1.24}\text{O}_{0.04}$ flakes reacted with hydrogen even after storage for several months in a desiccator or immersion in water for several days. They can also be hydrided after an incubation period at room temperature without any heat treatment. The addition of the oxide phase produces a reduction in the incubation time. (9 refs.)

63741 Development of hydrides for motor vehicles. J.Topler, O.Bernauer, H.Buchner, H.Sauferer (Daimler-Benz AG, Stuttgart, Germany). *J. Less-Common Met. (Switzerland)*, vol.89, no.2, p.519-26 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).
The storage of hydrogen in metal hydrides is suitable for motor vehicles as well as for stationary applications. Since the metal hydrides are used both for fuel and for heat storage some interesting technical developments are possible. The development and applications of low and high temperature hydrides are reported and the solutions of some technical problems (e.g. improvement of heat transfer and hydride manufacture) are presented. (7 refs.)

63742 RNi_5 hydrogen storage compounds. J.Liu (Res. Center, Inco Alloy Products Co., Suffern, NY, USA), E.L.Huston. *J. Less-Common Met. (Switzerland)*, vol.89, no.2, p.527 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).
Summary form only given, as follows. The production of low cost RNi_5 hydrogen storage compounds requires the effective utilization of low cost rare earth mixtures and their byproducts. In this study a wide variety of commercial rare earth mixtures was used in the preparation of RNi_5 alloys which were successfully evaluated for hydriding properties. Blends of rare earth mixtures can be made to adjust hydride properties over wide ranges. The hydrogen capacity exceeded hydrogen-to-metal atomic ratios of 1.0 for all samples tested and was found to be independent of the rare earth ratios. Hydriding properties can be predicted well with linear regression equations derived from the experimental data and involving cerium, lanthanum, praseodymium and neodymium weight fractions. The desorption plateau pressure at 25°C is given by the relation; $\ln P_D = 10.60 - 5.70X_{\text{Ce}} - 10.03X_{\text{La}} - 8.46X_{\text{Pr}} - 7.40X_{\text{Nd}}$, when the rare earth weight fractions are normalized to give $X_{\text{Ce}} + X_{\text{La}} + X_{\text{Pr}} + X_{\text{Nd}} = 1$. (no refs.)

63743 Recent production of rare earth metals as hydriding materials. H.Toma, R.Ohmachi (Santoku Metal Industry Co., Kobe, Japan). *J. Less-Common Met. (Switzerland)*, vol.89, no.2, p.528 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).
Summary form only given, as follows. Gives a general view of the resources and production capacity of rare earths including misch metal and lanthanum metal for metal hydride applications. The composition and methods of producing misch metal and lanthanum metal are discussed. (no refs.)

63744 Development of a hydrogen storage system using metal hydrides. H.Suzuki, Y.Osumi, A.Kato, K.Oguro, M.Nakane (Government Industrial Res. Inst., Osaka, Japan). *J. Less-Common Met. (Switzerland)*, vol.89, no.2, p.545-50 (Feb. 1983). (International Symposium on the Properties and Applications of Metal Hydrides, Toba, Japan, 30 May-4 June 1982).
Fundamental research has been carried out on the development of the basic technology for a stationary hydrogen storage system using metal hydrides. The authors have built and tested a misch metal-nickel-manganese hydride storage reservoir (a unit cell), with an effective storage capacity of $1.6\ \text{m}^3$ of hydrogen. On the basis of the experiments, they have built and tested a stationary hydride reservoir for hydrogen storage constructed from many layers of the unit cells; this has a possible storage capacity of $16\ \text{m}^3$ of hydrogen. (5 refs.)

63745 RNi_5 hydrogen storage compounds ($\text{R} \equiv$ rare earth). J.Liu (Inco Res. & Dev. Center, Suffern, NY, USA), E.L.Huston. *J. Less-Common Met. (Switzerland)*, vol.90, no.1, p.11-20 (March 1983).
The production of low cost RNi_5 ($\text{R} \equiv$ rare earth) hydrogen storage compounds requires the effective utilization of low cost rare earth mixtures and their byproducts. A wide variety of commercial rare earth mixtures was used in the preparation of RNi_5 alloys which were successfully evaluated for hydriding properties. Blends of rare earth mixtures can be made to adjust hydride properties over wide ranges. Plateau pressures and hysteresis can be predicted well with linear regression equations involving cerium, lanthanum, praseodymium and neodymium weight fractions. The hydrogen capacity exceeded $[\text{H}]/[\text{M}] = 1.0$ for all samples tested and was found to be independent of the rare earth ratios. (14 refs.)

63746 Hydrogen absorption in $\text{La}_3\text{Ni}_{13}\text{B}_2$. F.Spada, H.Oesterreicher (Dept. of Chem., Univ. of California, San Diego, La Jolla, CA, USA). *J. Less-Common Met. (Switzerland)*, vol.90, no.1, p.1-4 (March 1983).
Reports on the hydriding properties of $\text{La}_3\text{Ni}_{13}\text{B}_2$ ($\text{LaNi}_{4.33}\text{B}_{0.67}$). Samples of differing composition were prepared to ascertain the binary stoichiometry. Compounds were prepared by induction melting the constituent elements. The samples were annealed, and then X-ray powder patterns were obtained using both $\text{CuK}\alpha$ and $\text{Cr K}\alpha$ radiation to verify phase purity. The hydrogen desorption isotherm was determined by pressure monitoring over the range 10 to 100 atm. (7 refs.)

63747 Effect of decreased use of lead in gasoline on the soil of a highway. D.S.Byrd, J.T.Gilmore, R.H.Lea (Dept. of Chem., Northeast Louisiana Univ., Monroe, LA, USA). *Environ. Sci. & Technol. (USA)*, vol.17, no.2, p.121-3 (Feb. 1983).
So that the effect on lead concentrations in highway soils of the mandatory use of unleaded gasoline in new automobiles could be assessed, lead concentrations in soils along US Interstate 20 in northeast Louisiana were determined in 1973, 1974, and 1979. These concentrations increased from 1973 to 1974 but decreased from 1973 to 1979. Lead in the soil moved slowly in the direction of surface water flow. Lead concentrations decreased with depth to 300 mm but then increased. The mandatory use of unleaded gasoline has decreased the lead concentrations in soils near highways. (7 refs.)

63748 Estimation of the percentage of annual groundwater recharge with bomb tritium using a cumulative mass balance method. B.C.E.Egboka (Dept. of Geol., Univ. of Nigeria, Nsukka, Nigeria), J.A.Cherry, R.N.Farvolden. *Pure & Appl. Geophys. (Switzerland)*, vol.120, no.2, p.330-47 (1982).
The bomb tritium (^3H) distribution patterns in the aquifer beneath an abandoned landfill at the Canadian Forces Base (CFB) Borden, Ontario, and in a

sandy aquifer at Whiteshell Nuclear Research Establishments (WNRE) Pinawa, Manitoba, all in Cada, were delineated in great detail. A sampling and monitoring network of multilevel samplers and bundle piezometers were used. The directions of groundwater flow were established, and the boundary between the tritiated and non-tritiated zones of the two aquifers were closely demarcated. Using a cumulative mass balance method, the ^3H input mass into the aquifers was compared with the ^3H mass in groundwater storage to estimate the percentages of annual groundwater recharge from 1953 to 1978. (12 refs.)

63749 Use of data on warm industrial effluents to study the dispersal of pollutants in rivers. V.A.Averkov, N.N.Del'vin, V.V.Pisarev, R.L.Strunze, A.K.Sukhoruchkin (Inst. of Appl. Geophys., USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.1, p.65-9 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.1, p.82-7 (1982).

The possibility of using heated waste waters to study the dispersal of pollutants that they carry is examined. The problem posed is solved with the aid of differential equations that describe turbulent transport of matter and heat in a mixed flow within a two-dimensional watercourse. A linear relation linking the temperature and the concentration of the pollutants at each point of the stream is derived. A series of field experiments has been performed to test this relationship. (7 refs.)

63750 Water pollution in the Fukuoka area. H.Yorozu, Y.Awaya, T.Kusuda.

Technol. Rep. Kyushu Univ. (Japan), vol.55, no.4, p.329-36 (Aug. 1982). In Japanese. [received: Feb. 1983]

For the conservation of water areas and the purification of water, positive environment-planning is required. To make clear the relationship between urban development and water pollution, the water quality levels of eleven rivers in the Fukuoka area during the past twenty-one years are investigated. Water quality levels in some rivers were predicted with regression analysis, in which the objective variables, water quality indices, are BOD and $\text{NH}_4\text{-N}$, and the number of the explanation variables is fourteen. In the case of analysis with data of the three river basins, the results are not applicable to the prediction of the water quality in other river basins with different regional characteristics such as the area of urban districts, and commercial and industrial population density. In the case of analysis with data of all the river basins investigated, the water quality in each river can be predicted to some extent. In order to improve the results in this study, additional variables would be needed. (4 refs.)

63751 Some aspects of the influence of surface and ground water chemistry on the mobility of thorium in the 'Morro do Ferro' environment. N.Miekeley, M.G.R.Vale, M.Tavarez (Catholic Univ. of Rio de Janeiro, Rio de Janeiro, Brazil), W.Lei.

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.725-33

During one year the elemental composition and some relevant physico-chemical parameters of stream water, which receives drainage water from the radioactive deposit have been measured. In addition, ground water samples from bore holes, as well as stagnant waters from trenches, and percolation waters from an old mine gallery have been analyzed. Although the data are still incomplete, the authors felt encouraged to publish preliminary results, noticing that information concerning thorium concentration in natural waters, especially ground waters, are very scarce. (12 refs.)

63752 Potential for the rapid transport of plutonium in groundwater as demonstrated by core column studies. D.R.Champ, W.F.Merritt, J.L.Young (Chalk River Nuclear Labs., Atomic Energy of Canada Ltd., Chalk River, Ontario, Canada).

Scientific Basis for Nuclear Waste Management V. Proceedings of the Materials Research Society Fifth International Symposium on the Scientific Basis for Nuclear Waste, Berlin, Germany, 7-10 June 1982 (New York, USA: North-Holland 1982), p.745-54

Examines the potential for the transport of Pu in a groundwater flow system through the use of laboratory columns prepared from 'undisturbed' horizontal cores taken from saturated zone soils adjacent to the Chalk River glass block site. The columns were spiked with ^{239}Pu , continuously eluted with groundwater from the glass block site, and the activity and physical-chemical characteristics of the ^{239}Pu in the effluent determined following various manipulations of the column elution conditions. (9 refs.)

63753 The interaction between air pollution dispersion and residential heating demands. F.W.Lipfert, P.D.Moskowitz, J.Dungan, J.Tichler, T.Carney (Brookhaven Nat. Lab., Upton, NY, USA).

J. Air Pollut. Control Assoc. (USA), vol.33, no.3, p.208-11 (March 1983).

Urban air pollution has traditionally been modeled using annual, or at best, seasonal emissions inventories and climatology. These averaging techniques may introduce uncertainty into the analysis, if specific emissions (e.g. SO_2) are correlated with dispersion factors on a short-term basis. This may well be the case for space heating emissions. An analysis of this problem, using hourly climatological and residential emission estimates for six US cities, indicates that the errors introduced using such averages are modest ($\sim \pm 12\%$) for annual average concentrations. Maximum hourly concentrations vary considerably more, since maximum heat demand and worst case dispersion are in general not coincident. The paper thus provides a basis for estimating more realistic air pollution impacts due to residential space heating. (8 refs.)

63754 Smog chamber studies of NO_x transformation rate and nitrate/precursor relationships. C.W.Spicer (Battelle Columbus Labs., Columbus, OH, USA).

Environ. Sci. & Technol. (USA), vol.17, no.2, p.112-20 (Feb. 1983).

An environmental chamber study of nitrogen oxide reactions is described. The aim of the investigation was to determine (1) the rate of NO_x transformation to nitrate products, (2) the environmental factors that influence the transformation rate, (3) the relationship between nitrate products and their hydrocarbon and NO_x precursors, and (4) relationships among NO_x , O_3 , and nitrates. The experiments made use of a 17-component hydrocarbon mixture designed to represent the major organic constituents of urban air. The implications and limitations of the experimental results are discussed. (23 refs.)

63755 Acid fog. B.Hileman.

Environ. Sci. & Technol. (USA), vol.17, no.3, p.117A-20A (March 1983).

Provides an account of the occurrence of acid fog. Acid fog occurs as a result of pollution. The author reports observations made in southern California that were made with a rotating arm collector. In addition to pH observations of NO_3^- , SO_4^{2-} , NH_4^+ and H^+ were also made. The observations indicate that acid fog is an important pollution phenomena and that very high acidity levels may occur away from the pollution source. Previous to these studies pollution measurements on foggy days only sample the ambient levels of gases in the air and ignored the pollution within fog droplets. (3 refs.)

63756 Gaseous tracers of Arctic haze. M.A.K.Khalil, R.A.Rasmussen (Dept. of Environmental Sci., Oregon Graduate Center, Beaverton, OR, USA).

Environ. Sci. & Technol. (USA), vol.17, no.3, p.157-64 (March 1983).

At Pt. Barrow in the Arctic, winter concentrations of CHCl_3 , CCl_2F_2 , CCl_3F , CH_2Cl_2 , C_2Cl_4 , C_2HCl_3 , CO , and CH_3Cl exceed their concentrations during other times of the year, similar to the seasonal pattern of Arctic haze. The anthropogenic halocarbons and the combustion-derived CO and CH_3Cl are produced at the same midlatitude locations as the precursors of Arctic haze and therefore serve as inert tracers of long-distance transport of pollution to the Arctic atmosphere. The best gaseous tracers of Arctic haze are entirely man-made and have atmospheric lifetimes of less than about 5 years, or their concentrations are far from equilibrium with current yearly emissions. The presence of combustion-derived gaseous pollution in the Arctic during winter agrees with independent studies showing a significant combustion-derived component in the Arctic haze aerosol. During winter faster transport of polluted air to the Arctic is partly responsible for the occurrence of Arctic haze as well as the observed excess concentrations of trace gases. (33 refs.)

63757 Numerical simulation of fog formation and liquid water content on polydisperse multi-composition aerosols due to combustion-related pollutants. R.J.Hung (Univ. of Alabama, Huntsville, AL, USA), G.S.Liaw, R.E.Smith.

J. Environ. Sci. (USA), vol.26, no.1, p.44-8 (Jan.-Feb. 1983).

Reports the results of investigations of the dynamic and microphysical processes involved in the formation of advection fog on aerosols. The effects of a polydisperse aerosol distribution and a multi-composition aerosol species on the condensation/nucleation processes are of particular interest. The results show that an aerosol population with a high particle concentration provides more favorable conditions for the formation of a denser fog than an aerosol population with a larger particle size, if the value of the total mass concentration of the aerosols is kept constant. A numerical study of the effect of the aerosol particle size distribution on the wet removal nucleation processes shows that the aerosol particle size distribution does not affect the amount of liquid water produced if the mass concentration of the aerosol particles is kept constant. (18 refs.)

86.70J Noise

(see also 43.50 Noise, its effects and control)

- 63759 Using the NRR to estimate the real world performance of hearing protectors.** E.H.Berger (EAR Div., Cabot Corp., Indianapolis, IN, USA). *Sound & Vib. (USA)*, vol.17, no.1, p.12-18 (Jan. 1983).
The efficacy of single number measures of hearing protector noise reduction is examined. The accuracy of such estimates is shown to be a function of both the procedure by which the single number is computed and of the assumed attenuation data from which it is computed. One such single number measure is the EPA's Noise Reduction Rating (NRR) which is intended to be subtracted from the C-weighted work-place noise levels in order to estimate the employees' A-weighted exposures. By summarizing data from over 10 studies, incorporating 1551 subjects, it is demonstrated that the principal error in using the NRR or an NRR-like number is the basic laboratory data from which the NRR is computed. Thus, utilization of a long method computation involving an octave band noise analysis and the full attenuation and standard deviation data for the protector, gains one little in terms of improving estimates of the actual protection received by industrial populations. - 63760 An air quality data analysis system for interrelating effects, standards, and needed source reductions. VII. An O₃-SO₂ leaf injury mathematical model.** R.I.Larsen (US Environmental Protection Agency, Res. Triangle Park, NC, USA), A.S.Heagle, W.W.Heck. *J. Air Pollut. Control Assoc. (USA)*, vol.33, no.3, p.L98-207 (March 1983).
For pt.VI see ibid., vol.30, p.662 (1980). Leaf injury data from acute and chronic exposure studies of Dare soybean were regressed against the logarithms of exposure time and O₃ and SO₂ concentrations to develop a new two-pollutant leaf injury model (which explains 88% of the variance) and to calculate the parameters of best fit for this new model and a previously developed one-pollutant model. Using the calculated parameters, the percentage of leaf surface injured over a growing season by O₃, SO₂, or both simultaneously was estimated for an ambient air sampling site located 2 miles from a coal burning power plant. For this site, the one- and two-pollutant models predicted that SO₂ effects would be negligible if SO₂ concentrations never exceeded the National Ambient Air Quality Standard (NAAQS) of 0.50 ppm, averaged over 3 h. However, calculations suggest that O₃ may injure up to 24% of Dare soybean leaf surface over a growing season even though the O₃ NAAQS of 0.12 ppm, averaged over 1 h, is never exceeded. (19 refs.)
- 63761 Physics of remote sensing.** B.L.Deekshatulu, O.P.Bajpai (Nat. Remote Sensing Agency, Secunderabad, India). *Curr. Sci. (India)*, vol.51, no.24, p.132-43 (20 Dec. 1982).
Discusses the features, of multispectral remote sensing beginning with illustrations of the typical spectral signatures of Earth features and effects of physical and biological processes on the spectral signatures. This is followed by a brief discussion on the effects of the atmosphere on remote sensing and the possible ways of correcting for them. The instrumentation for multispectral remote sensing is also discussed followed by a brief mention of the applications of remote sensing to various disciplines. The discussion is limited to the optical region of the EM spectrum i.e. 0.3 to 15 μ m which is the most exploited spectral region for remote sensing. (14 refs.)
- 63762 Possibility of using certain transitions of He-Ne and He-Xe lasers for the analysis of nitric oxide, sulfur dioxide, and higher hydrocarbons.** A.I.Popov, A.V.Sadchikhin. *J. Appl. Spectrosc. (USA)*, vol.36, no.5, p.499-501 (May 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.36, no.5, p.727-30 (May 1982). [received: Feb. 1983]
Reports on a feasibility study of the analysis of NO, SO₂ and total higher hydrocarbons by means of a He-Ne laser ($\lambda=3.3912$ and 5.4048μ m) and He-Xe laser ($\lambda=3.3676$ and 3.9966μ m). In order to determine the feasibility

and desirability of using these lasers in the analysis of these gases, it is necessary to measure the absorption coefficients K of the radiation from the named transitions in these gases. In determining K, the authors measured the absorption of radiation of the main transitions in cuvettes of various length filled with mixtures of these gases in nitrogen. (9 refs.)

- 63763 High-sensitivity atmospheric gas analysis based on intracavity laser detection of scattered radiation.** A.P.Godlevskii, A.K.Ivanov, Yu.D.Kopytin (Inst. of Atmospheric Optics, Acad. of Sci., Tomsk, USSR). *Sov. J. Quantum Electron. (USA)*, vol.12, no.10, p.1304-7 (Oct. 1982). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.9, no.10, p.2007-12 (Oct. 1982). [received: April 1983]
A method of atmospheric gas analysis, based on intracavity detection of scattered radiation, is proposed and investigated. A theory of the method is developed for incoherent detection of the radiation in a laser and its possibilities are estimated. Investigations of intracavity lidar systems utilizing ruby, neodymium glass, and argon lasers are described. (12 refs.)
- 63764 On the organization of a new observing network for environmental pollution monitoring.** T.N.Zhigalovskaya, I.M.Nazarov, Sh.D.Fridman, O.S.Renne (Inst. of Appl. Geophys., USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.1, p.49-55 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.1, p.62-70 (1982).
The advantages of using network snow surveys for a new environmental (air, surface water, soil) pollution monitoring network are pointed out. Problems of organizing the observations and using them to evaluate the pollution and forecast changes are considered. The discussion is based on five years of work in various regions of the USSR. 87.00 BIOPHYSICS, MEDICAL PHYSICS, AND BIOMEDICAL ENGINEERING

87.10 GENERAL, THEORETICAL, AND MATHEMATICAL BIOPHYSICS

(inc. logic of biosystems, quantum biology, and relevant aspects of thermodynamics, information theory, cybernetics, and bionics)

- 63765 Inhomogeneous interfacial regions of biological systems. I. Basic differential equations and their implications.** V.S.Vaidhyanathan (Dept. of Biophys. Sci., State Univ. of New York, Buffalo, NY, USA). *J. Biol. Phys. (USA)*, vol.10, no.3, p.153-66 (1982).
On the premise that the contributions from ion-ion interaction energy terms to chemical potential of an ion in inhomogeneous regions cannot be neglected, the classical expression for electrochemical potential is modified. Resulting basic differential equations and their implications regarding ion distributions in inhomogeneous regions are presented. It is shown that a necessary consequence is the existence of a dielectric profile in inhomogeneous regions due to nonvanishing interaction energy terms of the chemical potential. (17 refs.)
- 63766 On competitive failure modes and the usefulness of a 'survival curve point of view'.** A.B.Wolbaste (Dept. of Radiation Therapy, Harvard Medical School, Boston, MA, USA). *Med. Phys. (USA)*, vol.10, no.2, p.232-6 (March-April 1983).
A number of medical phenomena may be discussed in terms of the probability of something 'surviving' as a function of time, dose, distance, etc. Employing elementary results of engineering reliability theory, the author examines the different shapes of survival curves which can arise when several modes of failure compete for the members of a homogeneous or heterogeneous population. A variety of examples of medical interest illustrate the approach. (29 refs.)
- 63767 A skeleton of physical ideas for the dynamics of complex systems.** F.E.Yates, A.S.Iberall (Crump Inst. for Medical Engng., Univ. of California, Los Angeles, CA, USA).
10th IMACS World Congress on System Simulation and Scientific Computation, Montreal, Canada, 8-13 Aug. 1982 (New Brunswick, NJ, USA: IMACS 1982), p.190-3 vol.2
Complex systems, from atomic ensembles to galactic clusters, are defined as fluid-plastic-elastic systems in which internalized atomistic time delay is large, with the consequence that interactions among parts lead to internalization of action (energy x time) and variable process delays between external inputs and outputs. Living systems are thus notably complex. The interior fields of complex systems can be described dynamically through an extended statistical mechanics and irreversible thermodynamics, in the form of an electro-magnetic-hydrodynamic field physics. Chemical reactivity (making, breaking or exchanging bonds) is subsumed in the generalized mechanics. This physical construct is applied to dynamic regulation and coordination among parts in the life forms found in the more than 300 families of flowering plants. (6 refs.)

87.15 MOLECULAR BIOPHYSICS

(see also 36.20 Macromolecules and polymer molecules)

63768 Solubility of hematoporphyrin and photodynamic damages in liposomal systems: optical and electron spin resonance studies. C.Emiliani, M.Delmelle, S.Cannistraro, A.Van de Vorst (Phys. Experimentale, Inst. de Phys., Univ. de Liege, Sart-Tilman, Belgium). *Photobiochem. & Photobiophys. (Netherlands)*, vol.5, no.2, p.119-28 (Feb. 1983).

The interaction between hematoporphyrin and egg lecithin liposomes was studied. The hematoporphyrin solubility in the lipid matrix was estimated by way of the partition coefficient which varied with lipid and sensitizer concentrations, indicating that solubilisation is a complex process. Spin labeled fatty acids were used to obtain some information about the location of maximal hematoporphyrin density within the membrane. Concerning the photodynamic damages produced by the sensitizer illumination, type I and type II mechanisms were observed but that latter amounts to more than 95%. (30 refs.)

63769 A review of some present molecular and submolecular physical concepts in biology. R.Pethig (School of Electronic Engng. Sci., Univ. Coll. of North Wales, Bangor, Wales).

J. Biol. Phys. (USA), vol.10, no.4, p.201-18 (1982).

Increasing attention is being directed towards understanding cellular processes at the molecular and submolecular levels. This article describes some of the physical concepts, such as proton transport in membrane pores and at protein-water interfaces, tunnelling processes, electronic conduction and induction effects in membrane-associated protein structures, that are currently being investigated and developed in the study of such functions as energy transduction and the passive and active transport of ions in cell membranes. (62 refs.)

63770 Protein dynamics from Mossbauer spectra. The temperature dependence. E.W.Knapp, S.F.Fischer, F.Parak (Phys. Dept. der Tech. Univ. Munchen, Garching, Germany).

J. Phys. Chem. (USA), vol.86, no.26, p.5042-7 (23 Dec. 1982).

Protein-specific dynamics reveals itself in Mossbauer spectra by a strong temperature dependence of the mean square displacement, $\langle x^2 \rangle$, of the Mossbauer nucleus. In addition, the protein dynamics may give rise to broad lines whose width and intensity also strongly depend on temperature. Both features are understood with an extension of the Brownian oscillator model which accounts for fluctuations between conformation substates mediated by transition states. The model is also capable of relating the temperature dependence of $\langle x^2 \rangle$ values obtained from X-ray investigations and Mossbauer experiments. $\langle x^2 \rangle$ values from Mossbauer experiments exhibit saturation at high temperatures. (35 refs.)

63771 Physics of ligand migration in biomolecules. P.Hanggi (Dept. of Phys., Polytech. Inst. of New York, New York, NY, USA).

J. Stat. Phys. (USA), vol.30, no.2, p.401-12 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

The study of migration of ligands in heme proteins is one of the methods used to obtain information about the dynamics and function of biomolecules. An appropriate description of the kinetics involves the modeling of transport over a series of sequential barriers. Utilizing random walk theory, the physics of ligand migration enters the modeling of the kinetics on several levels of description. By use of generalized Brownian motion theory, the author develops models for biomolecular rates in presence of a frequency-dependent damping of the ligand motion. The results have the form of a modified Kramers relation. If more than one ligand moves inside a biomolecule, nonlinear blocking effects become important. The migration kinetics can then be adequately modeled by a multivariable stochastic process with nonlinear transition probabilities. Further, the author discusses the limit of validity of a description of ligand migration in terms of a set of linearly coupled deterministic rate equations. (27 refs.)

63772 Soliton excitations in deoxyribonucleic acid (DNA) double helices.

S.Yomosa (Dept. of Phys., Nagoya Univ., Nagoya, Japan).

Phys. Rev. A (USA), vol.27, no.4, p.2120-5 (April 1983).

Presents in this paper a soliton theory for the open states in deoxyribonucleic acid (DNA) and synthetic polynucleotide double helices. Kink and antikink solutions for the equation of motion of the sine-Gordon form correspond to the open states with positive and negative helicities. The energy of open form and the length of the open configuration which are theoretically estimated are in the same order with the values inferred from kinetic experimental data. (15 refs.)

63773 Adsorption of proteins in processes of interaction of polymers with blood and model solutions. A.L.Iordanskii, G.E.Zaikov.

Vysokomol. Soedin. Ser. A (USSR), vol.25, no.3, p.451-76 (March 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*

The adsorption of plasma proteins is of great importance in processes of interaction of polymers with blood. The composition of proteinated polymer surface affects the intensity of adhesion of thrombocytes and subsequent formation of the thromb. The thermodynamic aspect of adsorption is discussed. The existence of two types of adsorption of proteins is shown, one of which being characterized by essential conformational changes of strongly adsorbed globulins. The architecture and structural features of proteins on a nonphysiological surface have to determine the choice of thrombo-resistant polymeric material. (115 refs.)

87.15B Structure, configuration, conformation, and active sites at the biomolecular level

63774 Structure and function of viroids. D.Riesner (Inst. fur Phys. Biologie, Univ. Dusseldorf, Dusseldorf, Germany), G.Steger, J.Schumacher, H.J.Gross, J.W.Randles, H.L.Sanger.

Biophys. Struct. & Mech. (Germany), vol.9, no.3, p.145-70 (1983).

A review is presented. Viroids are an independent class of plant pathogens which are distinguished from viruses by the absence of a protein coat and by their unusually small size. They are single-stranded circular RNAs composed of about 360 nucleotide residues. Sequence analysis and physicochemical studies of the potato spindle tuber viroid (PSTV) have shown that, as a result of intra-molecular base pairing, viroids form a unique rod-like secondary structure which is characterized by a serial arrangement of double-helical sections and internal loops. There is no indication for an additional tertiary structure because all parts of the molecule are freely accessible to ligand interactions.

Current hypotheses about the function of viroids are discussed on the basis of their structural and thermodynamic features. The suggestion that viroid RNA has features similar to DNA has been supported by the finding that they are replicated in vitro by the DNA-dependent RNA polymerase II of the host plant. (58 refs.)

63775 A two-dimensional gas of interacting electric dipoles with hard cores: Van der Waals isotherms and their possible application in lipid phase transitions. P.A.Westhaus (Dept. of Phys., Oklahoma State Univ., Stillwater, OK, USA).

J. Biol. Phys. (USA), vol.10, no.3, p.125-51 (1982).

Calculates the thermodynamic properties of a two-dimensional fluid of hard disks with embedded dipoles. Attention is centered on the isotherms in the neighborhood of the critical point. Evaluating the canonical partition function by the 'factor cluster expansion', the author exhibits the Van der Waals loops obtained considering the exact two-body clusters. The Van der Waals isotherms can be scaled as universal functions of the parameter $\lambda = p^2/4\pi\epsilon_0 kT$, where p , r_0 , ϵ , are the dipole moment, hard core radius, and permittivity which characterize the interaction. The model is applied to the lipid phase transition found in natural and synthetic membranes. The typical critical parameters ($T_c \approx 300K$, $\pi_c \approx 50$ dyne/cm) reflect a physically reasonable value for the dipole moment of a polar head group of a lipid but a much-too-small value for the hard core radius. (17 refs.)

63776 A stochastic model for reversible pressure denaturation of chymotrypsinogen. C.W.Gardiner (Dept. of Phys., Univ. of Waikato, Hamilton, New Zealand).

J. Chem. Phys. (USA), vol.78, no.5, p.2549-56 (1 March 1983).

The relaxation rate characteristic of pressure denaturation of chymotrypsinogen is explained by a stochastic model in which both volume and shape changes are taken into account. All features of the data are explained qualitatively, though quantitative checks are not possible without more data. (8 refs.)

63777 The electronic structure of DNA related periodic polymers. P.Otto, E.Clementi (IBM Corp., Poughkeepsie, NY, USA), J.Ladik.

J. Chem. Phys. (USA), vol.78, no.7, p.4547-51 (1 April 1983).

Results of ab initio LCAO Hartree-Fock crystal orbital calculations using a minimal atomic basis set are reported for the single stranded periodic B-DNA models of cytosine, thymine, adenine, and guanine stacks and two polynucleotides with adenosine and thymidine as repeating unit, respectively. Further, the energy band structures of two poly(base pairs), poly(adenine-thymine), and poly(guanine-cytosine), representing a simple model of the B-DNA double helix are discussed. (25 refs.)

63778 Protein folding as a stochastic process. N.Go (Dept. of Phys., Kyushu Univ., Fukuoka, Japan).

J. Stat. Phys. (USA), vol.30, no.2, p.413-23 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982).

In physiological conditions globular protein molecules assume a specific native conformation uniquely determined by its amino acid sequence. Upon environmental changes the protein molecules undergo reversible unfolding (order losing) and folding (order gaining) transitions, which is similar to the first-order phase transition. Pathways of folding have been intensively studied in the hope of deciphering the code that amino acid sequences carry as to the three-dimensional structure of proteins. A strongly simplified lattice model of proteins has been found to be a powerful theoretical tool to simulate the dynamic process of the folding and unfolding transitions. The results of the simulation indicate the existence of stochastic pathways of folding. (15 refs.)

63779 Transmission of conformational change in insulin. C.Chothia, A.M.Lesk (Lab. of Molecular Biology, Medical Res. Council, Cambridge, England), G.G.Dodson, D.C.Hodgkin.

Nature (GB), vol.302, no.5908, p.500-5 (7 April 1983).

Crystal structures of insulin contain molecules that are similar but not identical in conformation. Packed helices move relative to one another, these shifts being accommodated by motions of side-chain atoms arising from small changes in torsion angles. Such low-energy conformational adjustments can accommodate shifts of no more than ~ 1.5 Å. This limits the extent to which conformational changes can be dissipated locally, causing their transmission over long distances. (17 refs.)

63780 Facile transition of poly[d(TG)_nd(CA)_n] into a left-handed helix in physiological conditions. D.B.Hamiford, D.E.Pulleyblank (Dept. of Biochem., Univ. of Toronto, Toronto, Ontario, Canada).

Nature (GB), vol.302, no.5909, p.632-4 (14 April 1983).

Reports that the unmodified DNA polymer d(TG)_nd(CA)_n readily undergoes a transition to a Z conformation when subjected to unwinding torsional stress in ionic conditions that are close to physiological. By using a two-dimensional gel electrophoresis system, the authors have determined both the critical free energy of supercoiling that is required to initiate the transition and the free energy of supercoiling that is required to maintain this polymer in the Z form. (27 refs.)

63781 Secondary structures of proteins and peptides in amphiphilic environments (a review). E.T.Kaiser (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA), F.J.Kezdy.

Proc. Natl. Acad. Sci. USA, vol.80, no.4, p.1137-43 (Feb. 1983).

Many peptides and proteins that act at lipid-water interfaces assume a unique amphiphilic secondary structure which is induced by the anisotropy of the interface. By using synthetic peptides in which these inducible amphiphilic structures have been optimized, one can show that the amphiphilic α helix is a functional determinant of representative apolipoproteins, peptide toxins, and peptide hormones. By increasing the amphiphilicity of the structurally important regions of the molecule, one can enhance the biological activity of the peptide even beyond that of the naturally occurring polypeptide. It is proposed that rigid amphiphilic secondary structures such as α helix, β sheet, or π helix will be found in most medium-sized peptides acting at membranes and lipid-water interfaces. (26 refs.)

63782 The mechanism of crystallization of proteins in an ultracentrifuge. V.V.Barynin, V.R.Melik-Adamyan (Inst. of Crystallography, Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.588-91 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.981-7 (Sept.-Oct. 1982). [received: April 1983]

The authors develop a rapid and reproducible method of obtaining crystals of P. vitale catalase by means of ultracentrifugation. They describe a mechanism of crystallization of proteins in an ultracentrifuge, permitting choice of the optimal conditions for obtaining large crystals. (6 refs.)

87.15M Interactions with radiations at the biomolecular level

- 63783 Fluorescence spectra and decay time measurements on chlorophyll *a* and a non-aggregating analogue.** R.G.Brown, E.H.Evans, S.G.Holderness, J.Manwaring, B.May (Div. of Chem. & Biology, Preston Polytech., Preston, England). *Photobiophys. & Photobiophys. (Netherlands)*, vol.5, no.2, p.87-92 (Feb. 1983).
- The effects of water on the absorption and fluorescence intensities of chlorophyll *a* and a non-aggregating analogue in aqueous ethanol are reported. Fluorescence decay times for the latter compound in aqueous ethanol and for both compounds in the detergents dodecyl dimethylamine *N*-oxide, sodium dodecyl sulphate and Triton X-100 have also been measured. (7 refs.)
- 63784 Energy storage in the primary step of the photocycle of bacteriorhodopsin.** R.R.Birge, T.M.Cooper (Dept. of Chem., Univ. of California, Riverside, CA, USA). *Biophys. J. (USA)*, vol.42, no.1, p.61-9 (April 1983).
- A pulsed-dye laser low temperature photocalorimeter is used to study the enthalpy differences between light-adapted bacteriorhodopsin (bR₅₆₈) and its primary photoproduct (K) at 77K. A key feature of the authors' experimental method is the use of the laser-induced photostationary state as an internal reference. Analysis of the forward (bR→K), reverse (K→bR), and mixed (bR↔K) photochemical reactions were carried out to measure $\Delta H_{12} = E_K - E_{bR}$. All three experiments yielded identical values of ΔH_{12} within experimental error ($\Delta H_{12}^{ave} = 15.8 \pm 2.5$ kcal mol⁻¹). Accordingly, the primary event in the photocycle of light-adapted bacteriorhodopsin stores ~30% of the absorbed photon energy at the 568-nm absorption maximum. The authors observe that the quantum yields ϕ_1 (bR→K) and ϕ_2 (K→bR), add up to unity within experimental error: $\phi_1 + \phi_2 = 1.02 \pm 0.19$ for ϕ_1 in the range 0.28-0.33. A theoretical analysis of energy storage in K suggests that at least one-half of the enthalpy difference between K and bR is associated with charge separation accompanying chromophore isomerization. (30 refs.)
- 63785 Electrooptical behaviour of purple membrane fragments in the thin oriented film.** M.P.Petrov (Inst. of Solid State Phys., Sofia, Bulgaria), N.G.Popdimitrova. *C.R. Acad. Bulg. Sci. (Bulgaria)*, vol.35, no.11, p.1475-7 (1982).
- Reports on the electrooptical investigation of a thin oriented film of a purple membrane aqueous suspension. A planar capacitor was used consisting of two glass plates as electrodes, covered with SnO₂ and supporting the sample. The film's thickness was fixed by means of a Mylar spacer at 10 μ m. The thin SiO₂ layer was obliquely evaporated on the electrodes so as to ensure tangential boundary conditions. Regularly distributed microgrooves on the electrode surface were thus obtained. The microgrooves widths are commensurable with PM fragment sizes. Therefore, in order to ensure a good mechanical orientation, the authors introduced the suspension into the capacitor through the capillary forces. (5 refs.)
- 63786 Water proton spin-lattice relaxation behaviour in heterogeneous biological systems.** N.Niccolai, C.Rossi, E.Tiezzi (Inst. of General Chem., Univ. of Siena, Siena, Italy). *Chem. Phys. Lett. (Netherlands)*, vol.96, no.2, p.154-6 (1 April 1983).
- The water proton spin-lattice relaxation rate has been measured for a condensed 50% deuterated erythrocyte water system. Nuclear relaxation data, obtained in nonselective and selective modes, indicate that cross relaxation between erythrocyte and water protons occurs. The observed selective relaxation enhancement is interpreted in terms of intermolecular nuclear interactions modulated by motions which satisfy the $\omega\tau_c \gg 1$ condition. Selective relaxation rates are here proposed to be more sensitive to interface characteristics than the nonselective ones. (13 refs.)
- 63787 Dynamic light scattering studies of protein solutions under high pressure.** B.Nystrom, J.Roots (Inst. of Phys. Chem., Univ. of Uppsala, Uppsala, Sweden). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.1, p.2833-7 (15 March 1983).
- Dynamic light scattering measurements on bovine serum albumin (BSA) at pH=4.7 ionic strength $I \approx 0.12$ M were carried out in the pressure interval 1-4000 atm and for concentrations ranging from 8-80 kg m⁻³. At moderate pressures the mutual diffusion coefficient *D* was found to decrease linearly with concentration, while at the highest pressures deviation from linearity was observed. For a given concentration, the value of *D* increases initially with pressure and passes gradually through a maximum; at higher pressures (about 1000 atm) *D* decreases with increasing pressure. The hydrodynamic radius, deduced from diffusion data extrapolated to infinite dilution, was observed to increase with pressure during the denaturation process (pressures above 1000 atm) of the protein. Upon releasing the pressure the return of *D* was not reversible. (26 refs.)
- 63788 DNA-divalent metal cation interactions measured by electrophoretic light scattering.** Kee Woo Rhee, B.R.Ware (Dept. of Chem., Syracuse Univ., Syracuse, NY, USA). *J. Chem. Phys. (USA)*, vol.78, no.6, pt.2, p.3349-53 (15 March 1983).
- The authors have used the laser Doppler technique of electrophoretic light scattering to study the electrokinetic and gross conformational manifestations of the binding of divalent cations to DNA in low-salt solutions. By electrokinetic assay, divalent ion affinities to DNA in the 5-500 μ M range increase in the order $Mn^{+2} < Co^{+2} < Mg^{+2} < Cu^{+2}$. The ELS spectra show that Cu²⁺ denatures double-stranded DNA in the 50-200 μ M concentration range, thereby augmenting the reduction in electrophoretic mobility. Counterion condensation theory correctly predicts the form of the electrophoretic mobility reduction for territorially bound ions such as Mg²⁺, but the absolute magnitudes of electrophoretic mobility predicted by an equation deduced from condensation theory overestimate the authors' experimental values. (27 refs.)
- 63789 A physical interpretation for the natural photosynthetic process.** R.Hill, P.R.Rich (Dept. of Biochem., Univ. of Cambridge, Cambridge, England). *Proc. Natl. Acad. Sci. USA*, vol.80, no.4, p.978-82 (Feb. 1983).
- The efficiency of the process of photosynthesis is shown to depend on the molecular conversion of power. This requires establishment of a discipline that is now implicit in current thought and that offers a definition of relationship between equilibrium state and power. The quantum aspect for the microscopic

process is different from the macroscopic system idealized as the heat engine and is required for the interpretation of molecular machinery. By using three postulates the ideal maximal efficiency for the molecular energy conversion is calculated from the data, which are assembled in the form of the 'Z scheme' for photosynthesis. The observed and the calculated efficiencies for a green plant are substantially in agreement. (32 refs.)

63790 Energetics of photosynthetic glow peaks. D.DeVault, Govindjee (Dept. of Physiology & Biophys., Univ. of Illinois, Urbana, IL, USA), W.Arnold. *Proc. Natl. Acad. Sci. USA*, vol.80, no.4, p.983-7 (Feb. 1983).

By postulating temperature-dependent equilibria between two or more electron carriers acting as traps for electrons or holes, it is possible to modify the Randall-Wilkins theory of thermoluminescence (see Proc. R. Soc. London Ser.A, vol.184, p.366-89, 1945) so as to explain the abnormally large apparent activation energies and apparent frequency factors observed in photosynthetic glow curves when fitted by unmodified Randall-Wilkins theory. The equilibria serve to inhibit the formation of the light-emitting excited state by withholding the needed precursor state. When the inhibition is released at higher temperature by shift of equilibrium with temperature, the rise of the glow peak can be much faster than would result from Arrhenius behavior based on the true activation energy and so appears to correspond to a higher activation energy accompanied by a larger frequency factor. From another viewpoint, the enthalpy changes, ΔH , of the equilibria tend to add to the activation energy. Similarly the entropy changes, ΔS , of the equilibria tend to add to the entropy of activation, giving the large apparent frequency factors. The positive values of ΔS needed would correspond to entropy decreases in the forward early electron transport. A comparison of the glow peaks obtained by different workers is also presented. (29 refs.)

87.16 BIOTHERMICS

63791 Blood volume and protein responses to skin heating and cooling in resting subjects. M.H.Harrison, R.J.Edwards, L.A.Cochrane, M.J.Graveney (Royal Air Force Inst. of Aviation Medicine, Farnborough, England). *J. Appl. Physiol. (USA)*, vol.54, no.2, p.515-23 (Feb. 1983).

The effects of alterations in skin temperature on intravascular volume and protein content have been investigated in resting subjects. With a normal core temperature (*T*_{ac}) both skin cooling and skin heating caused hemoconcentration, and heating was associated with an increased rate of protein loss from the intravascular space. Raising of the skin temperature after cooling, with *T*_{ac} depressed, and cooling of the skin after heating, with *T*_{ac} raised, were associated with an immediate reversal of the hemoconcentration, and gain of protein by the intravascular space. It is concluded that intravascular volume responses to thermal stress are dependent on the skin and core temperatures obtaining immediately prior to imposition of the stress and that, in particular, a low skin temperature predisposes toward hemodilution on subsequent exposure to heat; sweating per se does not necessarily result in hemoconcentration. The association of hemodilution with augmentation of intravascular protein, and the rapidity with which extravascular protein can apparently gain entry to the intravascular space, is taken as indicating a possible direct return of protein through capillary walls. (30 refs.)

63792 Effect of temperature on regulation of breathing and sleep/wake state in fetal lambs. I.R.Moss, A.J.Mautone, E.M.Scarpelli (Pediatric Pulmonary Div., Albert Einstein Coll. of Medicine, New York, NY, USA). *J. Appl. Physiol. (USA)*, vol.54, no.2, p.536-43 (Feb. 1983).

Lamb fetuses (*n*=16) were employed to study the effect of ambient liquid temperature on behavioral (*n*=16) and recorded (*n*=8) sleep/wake states and on absolute breathing threshold and responsivity to CO₂ (*n*=8). Sleep/wake states were estimated by electroencephalogram, nuchal electromyogram, and electrooculogram, as well as by behavioral criteria ex utero. CO₂ threshold and responsivity were assessed with fetal CO₂ tests in which fetal breathing was related to increasing fetal arterial CO₂ tension (Pa(CO₂)) during CO₂ rebreathing by the ewe. The high normal CO₂ threshold of the fetus [55.7 ± 2.4 (SE) Torr] at warm 'core' temperature ($39.6 \pm 0.3^\circ\text{C}$) was lowered significantly (to 41.6 ± 1.7 Torr) by cooling and decrease of core temperature (to $37.1 \pm 0.5^\circ\text{C}$). Similarly cooling increased responsivity to CO₂ (i.e. decreased *X*-axis intercept and increased slope) of maximal intratracheal pressure (ITP), ITP 100 ms after onset of a breath, and fetal ventilatory equivalent. The increased breathing frequency with cooling was less linear. Response to cooling characteristically included (1) rapid onset of vigorous breathing movements, and (2) development of less vigorous but more regular breathing movements concomitantly with the combined reduction of skin and core temperature. (31 refs.)

63793 Unusual core temperature decrease in exercising heart-failure patients. F.G.Shellock, S.A.Rubin, A.G.Ellrodt, A.Muchlinski, H.Brown, H.J.C.Swan (Dept. of Medicine, Cedars-Sinai Medical Center, Univ. of California, Los Angeles, CA, USA). *J. Appl. Physiol. (USA)*, vol.54, no.2, p.544-50 (Feb. 1983).

Heat dissipation during exercise is presumed to be impaired in heart-failure patients due to their constricted cutaneous circulation and depressed cardiac output. The authors studied core (pulmonary artery blood) temperature and hemodynamics in 16 patients with severe heart failure who performed maximal upright incremental exercise. Skin temperatures were also measured in six of these patients during rest and peak exercise. A normal group (*n*=5) was exercised for comparison. It is concluded that heart-failure patients have an unusual core temperature decrease throughout short-term maximal exercise. This is probably caused by a redistribution of their body heat, i.e., a mixing of the core blood with the cooler contents of the cutaneous and muscle circulations. (29 refs.)

63794 Heat-induced thermotolerance expressed in the energy metabolism of mammalian cells. J.Lunec, S.R.Cresswell (MRC Cyclotron Unit., Hammersmith Hospital, London, England). *Radiat. Res. (USA)*, vol.93, no.3, p.588-97 (March 1983).

Measurements were made of the effect of heat treatment on ATP levels in control and thermotolerant populations of murine lymphoma (L5178YS) and Ehrlich ascites cells to investigate whether the development of thermotolerance is associated with an increased ability of cells to maintain energy metabolism when challenged with heat treatment. For the L5178YS cells a single heat treatment produced a rapid reduction in ATP levels. However, previously

heat treated L5178YS cells showed an increased ability to maintain ATP levels when challenged with a second heat treatment, and this ability to maintain ATP levels varied in a manner which correlated with the appearance and decay of thermotolerance seen in the parallel cell survival studies. In contrast both single and fractionated heat treatments did not reduce ATP levels in Ehrlich ascites cells. (26 refs.)

87.20 MEMBRANE BIOPHYSICS

63795 Absorbance and fluorescence changes in relation to light-scattering changes in chloroplast thylakoid membranes. S.W.Thorne, J.T.Dunice, J.A.Lee (Div. of Plant Industry, CSIRO, Canberra, Australia). *Photobiochem. & Photobiophys. (Netherlands)*, vol.5, no.2, p.71-8 (Feb. 1983).

A survey is made of Mie, Rayleigh and selective dispersive scattering of light as they relate to chloroplast thylakoid membranes. The authors show how these affect both the slow absorbance changes around 515 nm (ΔA_{515}) and fluorescence changes (ΔF_{683}) which arise from changes in salt concentrations, valencies, pH, osmolarity, or actinic light. The grana thylakoid membranes of chloroplasts are considered as a design for photoadaptation to growth-light conditions in accord with the concept of complex refractivity ($n-ik$) where refractivity (n) and absorbance (k) are interrelated over the spectrum by the Kramers-Kronig equations. (57 refs.)

63796 Alamethicin pore formation: voltage-dependent flip-flop of α -helix dipoles. G.Boheim (Lehrbereich Zellphysiologie, Ruhr-Univ. Bochum, Bochum, Germany), W.Hanke, G.Jung. *Biophys. Struct. & Mech. (Germany)*, vol.9, no.3, p.181-91 (1983).

The voltage-dependency of alamethicin pore formation is explained by a flip-flop gating mechanism of single alamethicin molecules. The energetically preferred aggregate structure is changed from antiparallel to parallel molecule orientation by membrane voltage application. The electrical field is sensed by the permanent dipole of the α -helical molecule part which spans the hydrophobic membrane core. Ion conducting pore and pore states result from electrostatic repulsion of a varying number of parallel dipoles which arrange circularly. This model is consistent with published data and with two additional experimental facts, that pore state distributions are ionic strength dependent and pore state conductances depend on ionic current direction. (33 refs.)

63797 Elastic energy stored in a membrane due to electrostriction. F.J.Blatt (Dept. of Phys. & Neurosci. Faculty, Michigan State Univ., East Lansing, MI, USA). *J. Biol. Phys. (USA)*, vol.10, no.4, p.219-22 (1982).

The elastic energy stored in a biological membrane due to electrostrictive deformation is considered, and an expression is derived that relates this energy to the change in membrane capacitance and the electrostatic energy associated with a membrane potential. Based on available evidence it is concluded that electrostriction does not make a significant contribution to the energy stored in a charged membrane system. (10 refs.)

63798 Two-dimensional deuterium NMR of lipid membranes. L.Muller, S.I.Chan (Arthur Amos Noyes Lab., California Inst. of Technol., Pasadena, CA, USA).

J. Chem. Phys. (USA), vol.78, no.7, p.4341-8 (1 April 1983).

The intrinsic linewidths of deuterium resonance in randomly oriented solids or liquid crystals can be extracted from two-dimensional NMR spectra in which spectra dispersion due to the quadrupolar Hamiltonian is removed in the indirectly detected frequency domain ω_1 . Such spectra can be obtained with a modified quadrupolar echo sequence in which the interval between the excitation and echo radio frequency pulse is rendered the second time variable. With this method, deuterium NMR linewidths have been measured in two model bilayer membranes as a function of temperature: 1-myristoyl-2-myristoyl- d_{55} -phosphatidylcholine and a 3:2 1-palmitoyl-2-palmitoyl-(16,16)- d_5 -phosphatidylcholine:cholesterol mixture. (34 refs.)

63799 Use of small-angle scattering data to calculate the diameter distribution function for a system of spherical layers [biomembrane application]. N.I.Mischchenko, L.A.Feigin (State Univ., Kiev, Ukrainian SSR).

Sov. Phys.-Crystallogr. (USA), vol.27, no.5, p.519-21 (Sept.-Oct. 1982). Translation of: *Kristallografiya (USSR)*, vol.27, no.5, p.863-6 (Sept.-Oct. 1982). [received: April 1983]

The authors consider the intensity $i(s)$ of scattering by a polydisperse system of thin spherical layers with a wide diameter distribution and a nonuniform electron density profile through the thickness of a layer. They show that up to a certain value s_1 the function $i(s)$ is closely approximated by the intensity of scattering by infinitely thin spherical shells. The value of s_1 is determined by the radius of inertia of the thickness of the layer. The authors derive an expression giving the distribution function $p(2R)$ of the numbers of layers of various diameters in terms of the intensity in a section $(0, s_1)$. (7 refs.)

87.25 CELLULAR BIOPHYSICS

63800 Adsorption of concanavalin A on human platelets. A.B.Bikhazi, K.M.Bitari (American Univ. of Beirut, Beirut, Lebanon). *Ann. Biomed. Eng. (USA)*, vol.10, no.5, p.219-29 (1982).

A physiological cell surface adsorption system approach is investigated on human platelets utilizing mathematical modeling. Monodispersed washed platelets are freshly collected in an isotonic buffer as a suspension utilizing a gel filtration technique. Concanavalin A is used as a glycoprotein receptor adsorbate in the adsorption studies. Three mathematical models are proposed based on simple chemical equilibrium reactions between adsorbate and cell surface receptors in an effort to explain concanavalin A-platelet surface glycoprotein interaction. Model I assumes that all receptors are undergoing simultaneous surface reactions with the adsorbate and without correlation. Model II reflects a strong correlation between the receptors, when only one receptor is active and the second receptor(s) is nothing but the combination of first receptor-adsorbate complex. Model III assumes the presence of multiple receptors on the cell surface. Only when a specific fraction of the total number of one receptor have reacted, will the other receptor(s) initiate reaction with the adsorbate. The results suggest the existence of at least three major glycoprotein receptors interacting with the lectin, and having different equilibrium constants as indicated in the adsorption isotherm. Model III seems to support best the experimental data of concanavalin A interaction with platelet surface glycoproteins. (13 refs.)

63801 Spectral characterization of photosystem I fluorescence at room temperature using thylakoid protein phosphorylation. D.J.Kyle, N.R.Baker, C.J.Artzen (Plant Res. Lab., Michigan State Univ., East Lansing, MI, USA).

Photobiochem. & Photobiophys. (Netherlands), vol.5, no.2, p.79-85 (Feb. 1983).

An analysis is presented of the spectral changes in fluorescence emission of thylakoids at room temperature associated with phosphorylation of thylakoid polypeptides. An enhancement of fluorescence above 700 nm relative to emission at 685 nm was observed on phosphorylation, and the spectral characteristics of this enhancement were similar to the fluorescence emission spectrum of an isolated PS I particle at room temperature. The changes in the 77K fluorescence emission spectra resulting from phosphorylation of the thylakoids were directly related to the spectral changes in fluorescence emission observed at room temperature. (22 refs.)

63802 Motility of mouse fibroblasts in tissue culture. W.C.Parkinson (Dept. of Phys., Univ. of Michigan, Ann Arbor, MI, USA). *Biophys. J. (USA)*, vol.42, no.1, p.17-23 (April 1983).

The growth and motion of mouse L-cells in vitro have been studied by means of time-lapse photography. In particular, the mitotic period and the motility, defined in terms of $\langle R^2 \rangle$, the mean square displacement of an ensemble of cells, have been measured as a function of temperature. The motility is a function of the phase of the cell cycle. For approximately the first one-eighth of the mitotic period the motility is well described as a random walk with persistence, the duration of the persistence being determined by the time of extension of the filopodial spindle. The temperature dependence of the diffusion constant follows the Arrhenius factor. The mitotic period, which varies exponentially as $(1/T)$, exhibits a large variance, and the time difference in replication of daughter pairs follows approximately a Poisson distribution with a mean difference of 138 min at $T=37^\circ\text{C}$. There is no evidence of mirror symmetry in the motion of daughter pairs for fibroblast cells plated in vitro in Corning tissue culture flasks. (19 refs.)

63803 Force relaxation and permanent deformation of erythrocyte membrane. D.R.Markle, E.A.Evans, R.M.Hochmuth (Dept. of Biomedical Engng., Duke Univ., Durham, NC, USA). *Biophys. J. (USA)*, vol.42, no.1, p.91-8 (April 1983).

Force relaxation and permanent deformation processes in erythrocyte membrane were investigated with two techniques: micropipette aspiration of a portion of a flaccid cell, and extension of a whole cell between two micropipettes. In both experiments, at surface extension ratios $<3:1$, the extent of residual membrane deformation is negligible when the time of extension is less than several minutes. However, extensions maintained longer result in significant force relaxation and permanent deformation. The magnitude of the permanent deformation is proportional to the total time period of extension and the level of the applied force. Based on these observations, a nonlinear constitutive relation for surface deformation is postulated that serially couples a hyperelastic membrane component to a linear viscous process. In contrast with the viscous dissipation of energy as heat that occurs in rapid extension of a viscoelastic solid, or in plastic flow of a material above yield, the viscous process in this case represents dissipation produced by permanent molecular reorganization through relaxation of structural membrane components. Data from these experiments determine a characteristic time constant for force relaxation, τ , which is the ratio of a surface viscosity, η to the elastic shear modulus, μ . (18 refs.)

63804 Fluorescence of protein-treated sheep erythrocytes. A.G.Atanassov (Inst. of Biophys., Karl Mark Univ., Leipzig, Germany), Yu.G.Atanassova, F.Pliquett.

C.R. Acad. Bulg. Sci. (Bulgaria), vol.35, no.11, p.1545-7 (1982). The binding of positively charged proteins—protamine, polylyzine, and lysozyme—with black lipid membranes increases the fluorescence intensity of the membrane bound probe 1-anilino-8-naphthalenesulphonate (ANS). Ensuing from the different properties of the phospholipid and biological membranes the authors measured the ANS fluorescence in a suspension of sheep erythrocytes treated with protamine. (6 refs.)

63805 A theoretical and scanning electron microscope study on the electrically mediated inactivation of spermatozoa. S.Mahajan, S.K.Guha, M.M.Misro (Centre for Biomedical Engng., Indian Inst. of Technol., New Delhi, India).

J. Biol. Phys. (USA), vol.10, no.3, p.113-24 (1982).

Spermatozoa are known to carry a net negative charge and have been shown to die in a DC electric field, but the cause of the lethal effect has not been explored. The authors present here an experimental and theoretical analysis of various factors likely to lead to the mortality of spermatozoa. Alterations in the spermatozoon surface complex induced by the applied current density has been identified to be the most likely cause. (16 refs.)

- 63806** The effect of heat and radiation on the initiation and elongation processes of DNA synthesis. R.C.Davis, G.T.Bowden, A.E.Cress (Dept. of Radiology, Univ. of Arizona Health Sci. Center, Tucson, AZ, USA). *Int. J. Radiat. Biol. (GB)*, vol.43, no.4, p.379-90 (April 1983).
The pH step alkaline elution and alkaline sucrose gradient techniques were utilized to evaluate alterations in DNA replication (initiation and elongation) induced by heat and low dose X-irradiation in synchronized Chinese hamster ovary cells. The initiation and elongation processes of DNA synthesis were resistant at the G₁/S boundary (4 hours after mitosis) while in mid S phase (9 hours after mitosis) DNA initiation and elongation were sensitive to X-irradiation. The initiation and elongation processes of DNA synthesis which were radiation resistant at the G₁/S boundary could be inhibited by a hyperthermia treatment (43°C for 1 hour beginning at 4 hours after mitosis). The impairment of initiation in the heated cells was maintained through late S phase while that of elongation was reversible as judged by full recovery at 15 hours after mitosis. These data suggest that the known synergistic lethality of heat and radiation may be mediated by an impairment of initiation of DNA synthesis. (26 refs.)
- 63807** Variable interaction of heat and procaine in potentiation of radiation lethality in mammalian cells of neoplastic origin. B.Djordjevic (Dept. of Radiotherapy, Mount Sinai School of Medicine, New York, NY, USA). *Int. J. Radiat. Biol. (GB)*, vol.43, no.4, p.399-409 (April 1983).
Mild hyperthermia in conjunction with procaine HCl acts as a potentiator of radiation lethality in HeLa cells, with little toxicity for unirradiated cells. The majority of irradiated cells respond extensively within a four hour period of treatment with the two agents. Potentiation of radiation lethality by the combined treatment was also found in a line of human melanoma cells, and to a lesser extent in a line of human ovarian carcinoma cells. The interaction of heat and procaine in the process of potentiation of radiation lethality was assessed from a series of radiation survival curves, with temperatures ranging from 37 to 42°C and procaine concentrations from 1 to 3 mM. The interactive factor was obtained from the ratio of the Dose Reduction Factor (DRF) due to procaine in heated cells, to the DRF due to procaine in unheated cells; a ratio larger than unity denotes interaction of heat and procaine. The largest interaction was observed when individual agents exerted only a minimal radio-potentiating effect, as if increased effectiveness of one agent pre-empted the effectiveness of the other agent. (16 refs.)
- 63808** Recovery from heat damage in stationary and log phase diploid yeast cells under growth and non-growth conditions. N.M.S.Reddy, K.B.Anjaria, V.V.Deorukhakar, B.S.Rao (Div. of Radiological Protection, Bhabha Atomic Res. Centre, Bombay, India). *Int. J. Radiat. Biol. (GB)*, vol.43, no.4, p.465-9 (April 1983).
Reports studies on the recovery from heat-induced lethal damage in yeast cells in various stages of the cell cycle. Furthermore, the authors have investigated the kinetics of recovery from sublethal heat damage under growth and non-growth conditions. The results indicate that the recovery from heat-induced lethal damage is absent in cells in all stages of division cycle, that cells recover from most of the heat induced sublethal damage both under growth and non-growth conditions, and that the recovery is faster under growth conditions than under non-growth conditions. (10 refs.)
- 63809** Twin crystals in Ophrys leuca root cells. M.Salome, S.Pais, J.Araujo-Silva, F.Carvalho-Rodrigues (Dept. de Biologia Vegetal, Lisboa, Portugal). *Microsc. Acta (Germany)*, vol.87, no.2, p.177-82 (March 1983).
Paracrystalline structures are a common feature in many biological specimens. The fact that these paracrystalline structures are crystals in shown in this paper by the appearance of crystalline associations. The twin crystals the authors report in Ophrys leuca root cells were image processed to reveal the molecular basis of the structure. A model of the twin crystals is also proposed. (6 refs.)
- 63810** Three-dimensional architecture of a polytene nucleus. D.A.Agard, J.W.Sedat (Dept. of Biochem. & Biophys., Univ. of California, San Francisco, CA, USA). *Nature (GB)*, vol.302, no.5910, p.676-81 (21 April 1983).
The three-dimensional chromosome topography in an intact nucleus has been determined using fluorescently stained Drosophila polytene chromosomes, optical fluorescence microscopy and newly developed, generally applicable, cellular image reconstruction techniques. The folding pattern is a complex mixture of parallel chromosomal segments and intertwined coils and shows extensive interaction of the chromosomes with the nuclear envelope. (39 refs.)
- 63811** Hyperthermia-induced intracellular ionic level changes in tumor cells. P.N.Yi (Dept. of Radiology, Medical Univ. of South Carolina, Charleston, SC, USA), C.S.Chang, M.Tallen, W.Bayer, S.Ball. *Radiat. Res. (USA)*, vol.93, no.3, p.534-44 (March 1983).
The intracellular content of potassium (K) ions in P815 cells decreases when the media pH is lowered, and it increases when media pH is raised. The determination of the ion content therefore requires accurate control of the medium pH. The K ion content measured both by the flame emission method and by the K analog, ⁴⁰Rb, exhibits a decline when the cells are incubated at 43°C at a fixed pH chosen between 7.4 and 6.7. The chloride content also decreases while the sodium content does not change by a significant amount. Under the same hyperthermic conditions the intracellular pH decreases by a fraction of a pH unit. Simultaneously, the cell water volume increases by 20%, as measured by tritiated water. In the final analysis, hyperthermia produces an apparent deficit in the cellular osmolarity. A possible explanation is given. (22 refs.)

87.25D Biological transport; cellular and subcellular transmembrane physics

- 63812** Flickering of a nicotinic ion channel to a subconductance state. A.Auerbach, F.Sachs (Dept. of Biophys., State Univ. of New York, Buffalo, NY, USA). *Biophys. J. (USA)*, vol.42, no.1, p.1-10 (April 1983).
Nicotinic acetylcholine channels show bursts of activity where open channel currents are separated from each other by short closed periods called flickers. These flickers presumably represent transitions from the open state to the state preceding the first opening of a burst (doubly liganded, closed state). Using tissue cultured chick pectoral muscle, the authors have examined the amplitude distribution of flickers. Of those events sufficiently long to permit accurate measurement of the amplitude (~25% of all flickers), approximately two-thirds had a mean current equal to 10% of the fully open channel. The remaining one-third did appear to close completely. The subconducting flicker state is not a requisite step preceding channel opening. It is concluded that there are three types of flicker events: a short event (time constant ~0.1 ms) whose current distribution is uncertain and two longer events (time constant ~1 ms), one of which has a current ~10% of the main open state and the other of which has a current indistinguishable from zero. In contrast, the amplitude of flickers induced by the local anesthetic QX-222 is indistinguishable from zero. (24 refs.)
- 63813** Effect of tortuous extracellular pathways on resistance measurements. R.T.Mathias (Dept. of Physiology, Rush Medical Coll., Chicago, IL, USA). *Biophys. J. (USA)*, vol.42, no.1, p.55-9 (April 1983).
There are many instances in which we are limited to measuring macroscopic quantities such as a bulk flow or an average field. In biology, one is frequently interested in using such macroscopic measurements, for example, the total current from a tissue, to determine the microscopic properties of the cells or tubules of the tissue. The microstructure of the tissue will generally increase the resistance to flow over what would be measured in an unstructured medium. This paper derives a fairly general expression for the relationship between effective resistance to macroscopic flow and the specific resistance of the medium conducting the microscopic flow. This expression, called a tortuosity factor, is defined entirely in terms of measurable morphometric and geometric parameters of the tissue. (18 refs.)
- 63814** Changes in eggshell conductance after transfer of hens from an altitude of 3800 to 1200 m. H.Rahn, T.Ledoux, C.V.Paganelli, A.H.Smith (Dept. of Physiology, State Univ. of New York, Buffalo, NY, USA). *J. Appl. Physiol. (USA)*, vol.53, no.6, p.1429-31 (Dec. 1982). [received: April 1983].
Hens acclimated to an altitude of 3800 m (PB 480 Torr) were transferred to 1200 m (PB 657 Torr). Eggs were collected before departure and daily after the transfer so that changes in eggshell conductance could be studied. Over the next 2 mo eggshell conductance increased 30%, presumably to compensate for the 37% reduction (from 657 to 480 Torr) in gas diffusivity at the lower altitude. Measurements of shell thickness and number of pores in the shell allow one to calculate that most of the change in total pore area occurred by an increase in cross-sectional area of individual pores. (13 refs.)
- 63815** CO₂ diffusing capacity in isolated dog lung lobes and the role of carbonic anhydrase. T.Enns, E.P.Hill (Dept. of Medicine, Univ. of California, San Diego, La Jolla, CA, USA). *J. Appl. Physiol. (USA)*, vol.54, no.2, p.483-90 (Feb. 1983).
CO₂ diffusing capacities (DmCO₂) were measured at 22°C on 12 isolated perfused dog lung lobes before and after inhibition of lung tissue carbonic anhydrase (CA) by acetazolamide (Diamox). The hypothesis is that CA in the alveolar-capillary tissue enhances overall transport of CO₂ by converting CO₂ to HCO₃⁻ within aqueous portions of the tissue. HCO₃⁻ diffuses simultaneously with molecular CO₂, increasing the overall CO₂ flux, and then converts back to molecular CO₂ at the end of the aqueous pathway. To ensure at least partial diffusion limitation, lobes were perfused with phosphate buffer at high pH (7.7) and high flow rates. Plant CA (which is not inhibited significantly by Diamox) was added to the perfusate to provide rapid uptake of CO₂ via conversion to HCO₃⁻. After Diamox, DmCO₂ decreased 39.6%, indicating that CA does increase CO₂ transport through lung tissue. Surprisingly, DmCO₂ exceeds CO₂ diffusing capacity by only 9.3±2.1 times (without Diamox inhibition) rather than by the factor of 24 predicted by Graham's law on the basis of solubilities and molecular weights of the gases. (35 refs.)

63816 Stochastic aspects of biological locomotion. R.Nossal (Phys. Sci. Lab., Nat. Inst. of Health, Bethesda, MD, USA). *J. Stat. Phys. (USA)*, vol.30, no.2, p.391-400 (Feb. 1983). (Proceedings of a Symposium on Random Walks and Their Application to the Physical and Biological Sciences, Gaithersburg, MD, USA, 28 June-1 July 1982). Various aspects of random walks undertaken by motile bacteria and migrating leukocytes are discussed, including the motions of these cells when responding to gradients of chemoattractants. Brief reference also is made to studies of particle movements within the cytoplasm of eucaryotic cells. (39 refs.)

87.30 BIOPHYSICS OF NEUROPHYSIOLOGICAL PROCESSES

(exc. perception processes and speech)

63817 Sinusoidal voltage clamp of the Hodgkin-Huxley model. R.Fitzhugh (Lab. of Biophys., Nat. Inst. of Health, Bethesda, MD, USA). *Biophys. J. (USA)*, vol.42, no.1, p.11-16 (April 1983). A voltage clamp consisting of a sinusoidal voltage of amplitude V_1 and frequency f , superimposed on a steady voltage level V_0 , is applied to the Hodgkin-Huxley model of the squid giant axon membrane. The steady-state response is a current composed of sinusoidal components of frequencies $0, f, 2f, 3f, \dots$. The frequencies greater than f arise from the nonlinearity of the membrane. The total current is described by a power series in V_1 ; each coefficient of this series is composed of current components for one or more frequencies. For different frequencies one can derive higher-order generalized admittances characterizing the nonlinear as well as the linear properties of the membrane. Formulas for the generalized admittances are derived from the Hodgkin-Huxley equations for frequencies up to $3f$, using a perturbation technique. Some of the resulting theoretical curves are compared with experimental results, with good qualitative agreement. (5 refs.)

63818 Electrical resistance of muscle capillary endothelium. S.P.Olesen, C.Crone (Inst. of Medical Physiology, Univ. of Copenhagen, Copenhagen, Denmark).

Biophys. J. (USA), vol.42, no.1, p.31-41 (April 1983). A recently developed technique for in vivo determination of the electrical resistance of vascular endothelium in microvessels was applied to the vessels in a thin frog muscle, m. cutaneous pectoris. The technique consists of injection of current via a glass micropipette into a capillary and measurement of the resulting intra- and extravascular potential profiles with another micropipette placed at various distances from the current source. The theory of Peskoff and Eisenberg (1974) was used to handle the problems arising from distributed extravascular resistances and was experimentally shown to describe the external field satisfactorily. With this extension of one-dimensional cable theory the specific electrical resistance of arterial microvessels was $33 \Omega \text{ cm}^2$ and of venous capillaries $23 \Omega \text{ cm}^2$. The 'length constants' were 135 and 112 μm , respectively. If results from arterial and venous vessels are taken together, the ionic permeabilities at 20°C were $P(\text{Na}) = 3.9 \times 10^{-3} \text{ cm.s}^{-1}$, $P(\text{K}) = 5.7 \times 10^{-3} \text{ cm.s}^{-1}$, $P(\text{Cl}) = 5.9 \times 10^{-3} \text{ cm.s}^{-1}$ and $P(\text{HCO}_3) = 3.4 \times 10^{-5} \text{ cm.s}^{-1}$. These figures agree with figures for capillary permeability obtained in tracer experiments on whole muscle. The study bridges a gap between single capillary and whole organ techniques with the conclusion that the two different approaches lead to similar results in muscle capillaries. (42 refs.)

63819 Successive openings of the same acetylcholine receptor channel are correlated in open time. M.B.Jackson, B.S.Wong, C.E.Morris, H.Lecar (Lab. of Biophys., Nat. Inst. of Health, Bethesda, MD, USA). *Biophys. J. (USA)*, vol.42, no.1, p.109-114 (April 1983). Previous analysis of single-channel current records has shown that both the opening and closing transitions of chemically activated ion channels are operated by fast and slow kinetic processes. The fast component in the kinetics of channel opening has been interpreted as the reopening of a channel that has just closed. The fast component in the kinetics of channel closure has many possible explanations and is therefore more difficult to interpret. One can gain insight into the closing process by asking whether the lifetimes of successive openings of an acetylcholine receptor channel are correlated in open-state lifetime. Five kinetic models of channel closure are considered. Two of these models predict uncorrelated open-state lifetimes, one predicts correlated open-state lifetimes, and for two others a range of behavior is possible. Acetylcholine receptor channel data from cultured rat muscle are analyzed to show that open-state lifetimes are correlated, eliminating two models of channel gating. (20 refs.)

63820 Inhomogeneous interfacial regions of biological systems. II. Dielectric profile and ion distributions. V.S.Vaidyanathan (Dept. of Biophys. Sci., State Univ. of New York, Buffalo, NY, USA). *J. Biol. Phys. (USA)*, vol.10, no.3, p.167-177 (1982). For pt.I see *ibid.*, vol.10, no.3, p.153-66 (1982). The Taylor expansion procedure is utilized to obtain solutions of basic nonlinear coupled differential equations relating concentration profiles and electric potential profiles, under equilibrium conditions. On the basis of an assumed simple expression for the dielectric profile, solutions are obtained. Certain conclusions derived on the basis of analysis are discussed. (2 refs.)

63821 Studies on the human spontaneous electromyogram (EMyLoG). III. Spontaneous spinal cord activity of the cat relevant to the human spontaneous EMyLoG. Y.Sarica, M.Eti, C.Ertekin (Dept. of Clinical Neurology, Aegean Univ., Izmir, Turkey).

Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.2, p.168-79 (Feb. 1983).

For pt.II see *ibid.*, vol.55, p.24-33 (1983). The spontaneous electromyogram (EMyLoG) was investigated in 16 cats, some after laminectomy and some by a percutaneous intrathecal technique similar to the human approach. Small diphasic negative-positive waves at less than 50 μV , with short durations, were consistently recorded from the posterior aspect of the spinal cord in both laminectomized and intact cats. It was demonstrated that this kind of background activity is mainly located within the posterior halves of the spinal cord and is strictly dependent on the peripheral inputs producing excitability changes in the gray matter of the posterior horn. Monophasic positive waves of larger amplitude were often recorded from the anterior halves of the spinal cord in both types of recording. (39 refs.)

63822 Thalamic rhythms in cat during quiet wakefulness and immobility. J.J.Bouyer, C.Tilquin, A.Rougeul (Lab. de Neurophysiologie Comparee, Univ. Pierre & Marie Curie, Paris, France).

Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.2, p.180-7 (Feb. 1983).

The authors studied the cortical 'mu' rhythms in normal cats and their thalamic pacemaker. Mu (14 c/sec) activity develops when the animal is motionless, in a state of 'quiet waking'. It is distinct from other sensorimotor rhythms, with distinct cortical distributions, distinct frequencies and appearing under different behavioural and environmental conditions. The cortical mu

focus was shown to be centred within a restricted part of area SI, in the forepaw and wrist projection field. The related thalamic focus was localized in a small zone of the VP nucleus that also corresponded to the hand and wrist projection area. A coherence study confirmed the close relationship between the two foci, thalamic and cortical. After unilateral electrolytic destruction of the thalamic area, a small mu activity persisted, on the ipsilateral cortex, originating from the opposite side. After bilateral lesion of the VP foci, no mu activity could ever be recorded on either side, while the other sensorimotor rhythms were left intact. (21 refs.)

63823 Excitation-contraction coupling: role of K-activation within the transverse tubular system. J.P.Reuben, G.M.Katz (Dept. of Neurology, Columbia Univ., New York, NY, USA), P.W.Brandt, G.Suarez-Kurtz, M.S.Dekin.

Proc. Natl. Acad. Sci. USA, vol.80, no.4, p.988-92 (Feb. 1983).

Long-duration Ca action potentials induced in crustacean muscle fibers after prolonged exposure to quaternary ammonium ions are accompanied by attenuated tensions with unique time courses. The tensions have three phases. The initial phase, correlated with the upstroke of the spike, is a rapid increase in tension followed by relaxation to or near to resting level (on-tension). In the second phase, tension rises slowly as the spike plateau declines. The final phase is another rapid increase and decay in tension that is correlated with termination of the action potential (off-tension). To observe these tensions, fibers must be exposed to 50-100 mM tetrabutylammonium ion for about 1 hr or to lower concentrations for longer periods (e.g., 5 mM for 20-30 hr). To obtain a similar response in fibers treated with tetraethylammonium ion, higher concentrations or longer soaking periods, or both, are required. Because neither caffeine-induced tensions in intact fibers nor contractile protein and sarcoplasmic reticulum function in skinned fibers were modified by quaternary ammonium ions, their site of action appears to be limited to surface or transverse tubular system membranes, or both. The unique tensions can be explained by considering the mode by which quaternary ammonium ions block K channels in conjunction with a scheme in which activation of K channels within the transverse tubular system controls the driving force for influx of Ca ions. (30 refs.)

63824 Action potentials in macrophages derived from human monocytes. F.V.McCann, P.M.Guyre, J.J.Cole, J.A.G.Russell (Dept. of Physiology, Dartmouth Medical School, Hanover, NH, USA).

Science (USA), vol.219, no.4587, p.991-3 (25 Feb. 1983).

The electrical activity of macrophages derived from human blood monocytes was recorded in vitro with intracellular microelectrodes and was analyzed with computer-assisted data acquisition and analysis techniques. In cells impaled 6 to 8 days after the cultures were prepared, the resting potentials reached a maximum value of -72 millivolts. The cells were electrically excitable; spikes exhibited a slow upstroke, a fast downstroke, a discrete threshold, a large overshoot, and a brief undershoot. Repetitive firing was induced by a maintained depolarizing current. A positive relation was observed between transmembrane currents and resting potential. Voltage-current relations were nonrectifying for subthreshold current injections. Since these cells had not been treated with any specific activation factors, the electrical activity recorded is evidence for the presence of voltage-dependent inward and outward currents in the membranes of mature macrophages. 63825 Effects of moderate exercise on intraocular pressure. D.R.McDaniel, C.L.Tribbey, G.S.Tobias (Southern California Coll. of Optometry, Fullerton, CA, USA).

Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.3, p.154-7 (March 1983).

Intraocular pressure measurements were made on human subjects using a noncontact tonometer before and at several time intervals after moderate exercise on a bicycle ergometer. One minute after exercise, intraocular pressures were significantly decreased (by 25%) but gradually returned toward pre-exercise values in 20 to 30 min. The results confirm findings by others that physical exertion results in a transient decrease in intraocular pressures and suggest that the magnitude of the reduction and the time required for recovery are related to the severity of the exertion. (15 refs.)

63826 Ultrastructure and electric changes in donor cornea depending on the preservation time. Z.G.Takeva (Dept. of Anatomy, Medico-Biological Inst., Sofia, Bulgaria), N.G.Popdimirova, S.N.Mechkarski.

C.R. Acad. Bulg. Sci. (Bulgaria), vol.35, no.11, p.1549-52 (1982).

A study was made on the action of a moist chamber and nutritive medium, with ingredients depending on the preservation time, on the cornea potential and ultrastructure. A porcine eye cornea was used, separated and preserved in a moist chamber or in nutritive medium T-199 with ingredient Sopolcort H (250 mg l^{-1}). For the electronmicroscopic studies the material was fixed in 1% OsO_4 . After dehydration it was embedded in Durcupan ACM. The slices were prepared on ultramicrotome Reichert OH_2 , they were contrasted with uranylacetate and were observed on an electron microscope Hitachi HU 11 A. The biopotentials were measured with the help of a lamp voltmeter, the samples being placed in a plexiglass chamber constructed for the purpose. Biopotentials of 380 corneas were measured in this way. (6 refs.)

63827 Comparison of American Optical SR-IV refractive data with clinical refractive data on a group of myopic children. T.Grosvenor, D.M.Perrigin, J.Perrigin (Coll. of Optometry, Univ. of Houston, Houston, TX, USA). *Am. J. Optom. & Physiol. Opt. (USA)*, vol.60, no.3, p.224-35 (March 1983). As a part of a 3-year Myopia Control Study being conducted at the University of Houston, 131 myopes between the ages of 6 and 15 years have been refracted by means of both the redesigned SR-IV Programmed Subjective Refractive and conventional clinical procedures. The results indicated that for the majority of subjects, the refractive data obtained by means of the SR-IV differed by no more than 0.25 D from data obtained by conventional procedures. SR-IV and clinical refractive data were also compared for a group of 30 second year optometry students, and agreement for the two methods was found to compare favorably with agreement of clinical refractive data obtained by two or more examiners. (6 refs.)

63828 Myopia development in nonhuman primates—a literature review. M.H.Criswell (Indiana Univ., School of Optometry, Bloomington, IN, USA), D.A.Goss.

Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.3, p.250-68 (March 1983). Reviews and comments on the available literature dealing with myopia production in various types of monkeys and in tree shrews by experimental manipulations of their physical, visual, and/or bodily environments. The results from these studies are compared with hypotheses and models which purport to explain myopia development. Possible relations are also noted between conditions, created experimentally in myopic eyes of primates, and similar pathological states, clinically observed in certain human myopes. (71 refs.)

63829 Image quality of the human eye for eccentric entrance pupils. A.van Meeteren, C.J.W.Dunnewold (Inst. for Perception TNO, Soesterberg, Netherlands).

Vision Res. (GB), vol.23, no.5, p.573-9 (1983).

The human eye has a considerable amount of chromatic aberration and a moderate amount of spherical aberration. If a small artificial pupil is placed in front of such optics and moved away from the centre towards the periphery the chromatic aberration will result in lateral colour shifting, and the spherical aberration will cause coma. Starting from available experimental data on the chromatic aberration and the spherical aberration, modulation transfer functions (MTFs) are calculated for central and eccentric positions of small pupils placed in front of the human eye. These calculations may help to separate optical and retinal contributions to the well-known reduction of visual acuity measured with eccentric pupils. It appears that measurements with pupils smaller than 1 mm in monochromatic light can be considered optically as diffraction limited. Changes of visual acuity found in this way must be assigned to the retina. (16 refs.)

87.32E Physiology of the eye; nerve structure and function

63830 A model referenced method for the identification of evoked potential component wave forms. S.J.O'Connor, A.Tasman, R.H.Simon, M.S.Hale (Dept. of Psychiatry, Univ. of Connecticut Health Center, Farmington, CT, USA).

Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.2, p.233-7 (Feb. 1983).

Visual evoked potentials from rat visual cortex are described as the sum of components. Each component wave form is based on a mathematical model of neural activity. The model referenced approach yields an accurate description of the evoked potential wave forms before and after administration of an anesthetic known to alter neural activity. Thus, the method is efficient, is based in neurophysiology and is sensitive to drug effect on brain activity. (15 refs.)

63831 Differences in spectral response properties of LGN cells in male and female squirrel monkeys. G.H.Jacobs (Dept. of Psychology, Univ. of California, Santa Barbara, CA, USA).

Vision Res. (GB), vol.23, no.5, p.461-8 (1983).

The spectral response patterns of single cells recorded from the lateral geniculate nucleus (LGN) of the squirrel monkey (*Saimiri sciureus*) were examined in light of recent behavioral evidence indicating that there are significant variations in visual sensitivity and color vision within this species. The principal results from an analysis of data obtained from 1084 LGN cells were that (a) a significantly higher proportion of cells showing spectrally-opponent response patterns were recorded from female subjects, and (b) the proportion of spectrally-opponent units showing RG response patterns is very much higher in females than in males. These gender-related differences in the response patterns of LGN cells are discussed in the context of the behavioral results. (26 refs.)

63832 Response vs. excitation in response-dependent and stimulus-dependent lateral inhibitory networks. D.H.Edwards, Jr. (Dept. of Biology, Georgia State Univ., Atlanta, GA, USA).

Vision Res. (GB), vol.23, no.5, p.469-72 (1983).

Response-dependent and stimulus-dependent lateral inhibitory networks may be distinguished by differences in their net response vs. net excitation functions. It is shown that the net response of a stable, response-dependent network is a monotonically increasing function of the net excitation. By contrast, the response of a stimulus-dependent lateral inhibitory network can either increase, decrease or remain constant as the net excitation of the network is increased, dependent on the relation of the inhibition to the excitation. These differences make it possible to determine that the inhibition produced by a lateral inhibitory network is stimulus-dependent if the net response of the network declines as the network excitation increases. (14 refs.)

63833 Representation of the visual streak in visuotopic maps of the cat's superior colliculus: influence of the mapping variable. J.T.McIlwain (Div. of Biology & Medicine, Brown Univ., Providence, RI, USA).

Vision Res. (GB), vol.23, no.5, p.507-16 (1983).

A series of visuotopic maps has been prepared from recordings of electrical potentials related to W-cell afferent activity in the cat's superior colliculus. These maps clearly exhibit an expected exaggeration of the representation of the upper visual field, due to tilt of the retina's visual streak in the 'position of paralysis'. This asymmetry disappears when the visual field's coordinate system is rotated by an angle equal to the tilt of the axis of the nasal streak.

Previously published maps, based on recordings from postsynaptic collicular units, have failed to reflect this tilt of the nasal visual streak, perhaps in part because the centers of unit receptive-fields are biased estimators of the retinal origin of axons terminating near a collicular recording site. (34 refs.)

63834 A new concept of retinal colour coding. W.Paulus, A.Kroeger-Paulus (Univ.-Augenlinik, Dusseldorf, Germany).

Vision Res. (GB), vol.23, no.5, p.529-40 (1983).

A theory of retinal colour coding based closely on recent anatomical and physiological results is presented. Opponent colour channels are shown to be an inevitable result of any randomly distributed retinal cone mosaic, the structure of red-green opponent colour channels remaining uninfluenced by a predominance of 'red' or 'green' cones. These findings circumvent the conflict between anatomical results with more 'green' than 'red' cones and psychophysical estimations with more 'red' than 'green' cones. The effect of receptor compression and opponent colour transformation on colour perception is investigated. Non-opponency of pure green and pure red could be attributed to receptor compression, the Bezold-Brücke phenomenon, however, to the antagonism of 'red' and 'green' cones within the receptive field surround of red-green opponent cells. The fundamental colours are estimated to be supersaturated violet, yellow-green and yellow-red. (60 refs.)

63835 Vitreal and intraretinal responses to contrast reversing patterns in the pigeon eye. A.L.Holden, Vaegen (Dept. of Visual Sci., Inst. of Ophthalmology, London, England).

Vision Res. (GB), vol.23, no.5, p.561-72 (1983).

The pattern electroretinogram (PERG) has been recorded vitreally and intraretinally in the pigeon eye. The amplitude of the PERG increases monotonically as pattern contrast is increased, with saturation of high levels. The PERG of the central yellow field has band-pass spatial tuning, with a high frequency cut-off at 8 c/deg. Time-to-peak is shortest at low spatial frequencies. Both PERG and local b-wave are small and positive-going close to the retinal surface, and large and negative-going in the inner nuclear layer. The PERG and b-wave show qualitatively similar depth profiles. (22 refs.)

63836 Ultraviolet sensitivity of fly photoreceptors R7 and R8: evidence for a sensitising function. R.C.Hardie, K.Kirschfeld (Max-Planck-Inst. für Biologische Kybernetik, Tübingen, Germany).

Biophys. Struct. & Mech. (Germany), vol.9, no.3, p.171-80 (1983).

Responses to continuous spectral scans in the ultraviolet (UV) have been measured intracellularly from the central retinula cells R7 and R8 in the fly (*Musca*, female). The spectral sensitivities thus obtained have a resolution limited by the bandwidth of the light supplied by the monochromator (0.3-1.5 m). One class of R7 cells, classified as 7y (Kirschfeld et al. 1978) shows three conspicuous peaks of sensitivity at 337, 355 and 373 nm. The underlying R8 cells (8y) also show three peaks but at slightly shorter wavelengths—334, 350, and 369 nm, coinciding with those seen in the peripheral photoreceptors R1-6 (Gempeler et al. 1980; Kirschfeld et al. 1982). Another class of R7 cells (7p) showed a spectral sensitivity function with a single peak at 330 nm. The underlying R8 cells (8p) also show a single-peaked function with maximum at 460 nm. The results are interpreted as providing evidence for the hypothesis that UV sensitivity in 7y and 8y cells is conferred by a UV absorbing sensitising pigment similar to that demonstrated in R1-6 cells. The spectra of both 7p and 8p cells can be simply interpreted as deriving directly from the absorption of a rhodopsin with the appropriate λ max. (24 refs.)

63837 Discrete visual defects in pearl mutant mice. G.W.Balkema, N.J.Mangini, L.H.Pinto (Purdue Univ., West Lafayette, IN, USA).

Science (USA), vol.219, no.4588, p.1085-7 (4 March 1983).

The mutant mouse pearl, characterized by its hypopigmentation, has a specific function defect in a sensory system—the retina. The intact pearl mouse has reduced sensitivity in the dark-adapted condition. Normal sensitivity is restored by isolation and superfusion of the retina with bicarbonate-buffered Ringer solution, suggesting that the retinal expression of the pearl mutation depends on a diffusible substance. The pearl phenotype is described as a possible model for human congenital stationary night blindness. (25 refs.)

63838 Scotopic sensitivity to ON and OFF stimulus transients. P.W.Russell, T.G.Wheeler (Dept. of Ophthalmology, School of Medicine, Univ. of Louisville, Louisville, KY, USA).

Vision Res. (GB), vol.23, no.5, p.525-8 (1983).

The luminance of a large diffuse field, viewed peripherally, was temporally modulated near absolute detection threshold. The field luminance either increased abruptly and decreased gradually (ON stimulus) or increased gradually and decreased abruptly (OFF stimulus). For all wavelengths shorter than 620 nm, sensitivity to the ON stimulus was greater than to the OFF. The spectral sensitivity curves obtained indicate that rods and/or their associated neural pathways are more sensitive to ON stimulus transients than to OFF. (16 refs.)

63839 Densitometric measurement of human cone photopigment kinetics. V.C.Smith, J.Pokorny (Eye Res. Lab., Univ. of Chicago, Chicago, IL, USA), D.van Norren.

Vision Res. (GB), vol.23, no.5, p.517-24 (1983).

The radiance response function for steady state bleaching lights and the regeneration of the cone visual photopigments were measured using the continuous recording densitometer described by v. Norren and v.d. Kraats (see *ibid.*, vol.21, p.897-905, 1981). Measurements made on 5 deuteranopes, 1 protanope and 2 color-normal observers were similar. The radiance response function was steeper than the function predicted by a simple first-order kinetic equation. For a measured density (ca. 0.3) the authors evaluated whether high stray light (ca. 47.5%) and high two-way optical density (ca. 1.3) could account for the deviation from the prediction of a first-order equation. Such a model was rejected because these parameters predicted different estimates of the time course of regeneration for different test wavelengths (554 and 605 nm). Statistical analysis of the regeneration data revealed a highly significant non-linearity. A model in which the rate of regeneration

increases as the proportion of bleached photopigment decreases is required to explain both the radiance function and the regeneration data. (15 refs.)

63840 Contrast sensitivity in albinotic patients. D.S.Loshin, R.A.Browning (Univ. of Houston, Coll. of Optometry, Houston, TX, USA).

Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.3, p.158-66 (March 1983). Vertical and horizontal grating contrast sensitivity functions (CSF) were measured on eight albinotic patients. Several of these patients also had CSF measurements performed through their telescopic aids. For all the patients, the horizontal grating CSF was more sensitive than the vertical grating CSF. Although there are many pathological problems that could result in this sensitivity difference (high astigmatism, neural modification, etc.), the authors propose that in this case, the nystagmoid eye movements are the main causative factor. Through the telescopic aid, the CSF resolution acuity and peak sensitivity increased. The increase in resolution was somewhat less than would be predicted based on magnification. The increase in sensitivity is believed to be the result of stimulation of more sensitive peripheral retina. This increase in sensitivity is an added benefit to these patients corrected with low vision aids. (19 refs.)

63841 Small and moderate color differences. IV. Color-difference-perceptibility ellipses in surface-color space. D.C.Rich, F.W.Billmeyer, Jr. (Dept. of Chem., Rensselaer Polytech. Inst., Troy, NY, USA). *Color Res. & Appl. (USA)*, vol.8, no.1, p.31-9 (Spring 1983). For pt.III see AIC Color 77, Hilger, Bristol, p.495-8, 1978. Moderate (0.5-1.5 CIELAB units) color differences in surface colors were scaled visually to obtain color-difference-perceptibility ellipses. The ellipse orientations appeared to be independent of the size of the color differences over the range indicated, and were consistent with literature results obtained with visual colorimeters. In the vivid greenish yellow region, the experimental ellipse orientation agreed with the Munsell spacing but not with the orientation of the CIELAB ellipse. In the deep greenish blue region, the experimental ellipse orientation agreed better with the results of Wyszecki and Fielder (1971) than with the orientation of the MacAdam PGN ellipse. (26 refs.)

63842 A proposal of new standard deviate observers. Y.Nayatani (Osaka Electro-Communication Univ., Osaka, Japan), K.Takahama, H.Sobagaki. *Color Res. & Appl. (USA)*, vol.8, no.1, p.47-56 (Spring 1983). The method of singular-value decomposition analysis of matrices is used to analyze the 20 color-matching functions of Stiles's observers. It is confirmed that the 20 color-matching functions are well reconstituted by the first three decomposed components. A new deviate observer is derived from the first decomposed component. It is shown that the new deviate observer can be used well in the computation of observer-metamerism indices. Furthermore, an optimized deviate observer is developed by modifying the color-matching functions of the new deviate observer slightly. Both the new and the optimized deviate observer give a basis for the further study of the evaluation of observer metamerism. (13 refs.)

63843 Time thresholds for increments and decrements in luminance. W.H.Ehrenstein, L.Spillmann (Neurologische Universitätsklinik, Freiburg, Germany). *J. Opt. Soc. Am. (USA)*, vol.73, no.4, p.419-26 (April 1983). Time thresholds, i.e. the minimal durations necessary to just detect a change in brightness, were measured for light increments and decrements of a 1° test spot centered on a background of 20°. Background luminance varied from -1 to 3 log td and retinal eccentricity from 0° to 50°. Step size ranged from 0.04 to 1.5 log units and was the same in absolute units for both directions. Two types of stimuli were used: Type A, in which increments and decrements emerge from the same uniform background, and Type B, in which increments are the same as in Type A but decrements consist of a brief interruption of the test spot. Type A stimulation resulted in similar time thresholds for increments and decrements or, under some conditions, slightly shorter decrement thresholds. Type B stimulation resulted in similar thresholds for foveal vision. However, with increasing step size, decreasing background luminance, and increasing eccentricity, the time threshold for the decrement progressively exceeded that for the increment (up to 80 msec). This difference is attributed to different rise and fall times of the photoreceptor response as well as to Troxler's effect. (54 refs.)

63844 Sensitivity to countermodulating gratings following spatiotemporal adaptation. D.O.Bowker, U.Tulunay-Keesey (Dept. of Ophthalmology, Univ. of Wisconsin, Madison, WI, USA). *J. Opt. Soc. Am. (USA)*, vol.73, no.4, p.427-35 (April 1983). Contrast sensitivities to countermodulating gratings were measured with a two-alternative temporal forced-choice procedure following adaptation to a static grating of the same spatial frequency, a homogeneous flickering field of the same temporal frequency, or a countermodulating grating of identical spatial and temporal frequencies. At high spatial frequencies, the temporal-frequency content of the adaptation was not critical, that is, a countermodulating adaptation grating was only slightly more effective at raising threshold than was a static adaptation grating. At low spatial frequencies, the sensitivity to countermodulating test gratings could not be reduced by either a high-contrast stimulus matching the test in the spatial domain only or by one matching the test in the temporal domain only. Adapting to a high-contrast stimulus matching the countermodulating test grating in both spatial- and temporal-frequency domains was effective at reducing test sensitivity for one observer but not for another. (54 refs.)

63845 Suprathreshold spatiotemporal response characteristics of the human visual system. D.O.Bowker (Dept. of Ophthalmology, Univ. of Wisconsin, Madison, WI, USA). *J. Opt. Soc. Am. (USA)*, vol.73, no.4, p.436-40 (April 1983). The apparent contrasts of suprathreshold stationary gratings, countermodulated gratings, and homogeneous flickering fields were assessed with a contrast-matching procedure. Results show that, as stimulus amplitude is increased relative to threshold, variations in apparent contrast with spatiotemporal-frequency content become much less pronounced. In other words, the contrast-matching functions are more uniform across both spatial and temporal frequency at levels of contrast well above threshold. These data are interpreted in terms of a compensatory stage in the visual system that varies

its gain characteristics according to the detectability of the stimulus. (17 refs.)

63846 Visual detection of objects against backgrounds of nonuniform luminance. V.N.Martynov, B.I.Shkurskii. *Sov. J. Opt. Technol. (USA)*, vol.49, no.7, p.406-9 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.6-9 (July 1982). [received: April 1983]

On the basis of a model of a visual analyzer as an optimum system for receiving optical signals, a method of estimating the threshold luminance difference for the visual detection of arbitrarily shaped objects against a background of nonuniform luminance has been developed and verified experimentally. (5 refs.)

63847 Determination of visual threshold contrasts by means of achromatic and colored test objects. N.P.Travnikova, A.S.Malyshova, L.V.Sergeeva, L.I.Chernikova.

Sov. J. Opt. Technol. (USA), vol.49, no.7, p.410-12 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.9-12 (July 1982). [received: April 1983]

The threshold contrasts are determined for colored test objects having an angular size of 80-100' at background luminances of 10-150 cd/m². It is shown that the average values of the threshold for the disappearance and appearance of the colored object images are almost identical to the corresponding values of achromatic objects. (2 refs.)

63848 A geometrical theory of scaling in the sensory system with several inputs and a single output. R.Takiyama (Kyushu Inst. of Design, Fukuoka, Japan).

Trans. Inst. Electron. & Commun. Eng. Jpn. Part A (Japan), vol.J66A, no.1, p.16-23 (Jan. 1983). In Japanese.

To investigate the psychophysical functions which characterize the sensory system with several inputs and a single output, the author constructs the Riemannian state space spanned by several physical continua as well as the corresponding psychological continuum, and defines psychophysical functions as geometrically invariant quantities in the space. By introducing a certain fundamental metric based on the difference thresholds, the allowable psychophysical functions are derived. Applying this formalization, some psychophysical laws in vision are examined. It is shown that Stiles' and Abney's laws are derived as allowable functions provided that Weber's and Ekman's laws hold. (19 refs.)

63849 Visual correspondence problem in apparent moving patterns. K.Shoji, Y.Arakawa (Faculty of Engng., Utsunomiya Univ., Utsunomiya, Japan).

Trans. Inst. Electron. & Commun. Eng. Jpn. Part A (Japan), vol.J66A, no.1, p.86-92 (Jan. 1983). In Japanese.

Perceived correspondence between successive frames was investigated in right-angled trapezoids ranging in shape from right-angled triangle to square. At appropriate timing, the 1st pattern presented was presented horizontally and then 2nd pattern presented with orientational disparity, ranging from 0° to 360°. The results of the psychological experiment demonstrate the existence of competing mental tendencies to preserve the rigid structure of an object and to traverse a minimum transformational path. In order to verify this existence, a model of correspondence decision making was constructed. The computational outputs of this model fit the experimental data approximately. (9 refs.)

63850 Light and dark bars: contrast discrimination. G.E.Legge, D.Kersten (Dept. of Psychology, Univ. of Minnesota, Minneapolis, MN, USA). *Vision Res. (GB)*, vol.23, no.5, p.473-83 (1983).

Contrast increment thresholds were measured for light and dark bars as a function of the base contrast of the bars. The bars were superimposed on a uniform field of 340 cd/m². They had either rectangular or Gaussian luminance profiles, varied in width from 0.1° to 10°, and in duration from 10 to 200 msec. For the 200-msec presentations, the resulting contrast discrimination functions all had approximately the same shape when contrast was defined as $(L_{max} - L_{min}) / (L_{max} + L_{min})$, and closely resembled corresponding results for sine-wave gratings. The similarity in shape of contrast discrimination functions for light and dark bars is attributed to a retinal nonlinear intensity transformation. The 10 msec contrast discrimination functions differed from the 200-msec functions in ways that can be explained by differences in temporal integration. (42 refs.)

63851 Spatial frequency masking and Weber's law. D.J.Swift, R.A.Smith (Vision Res. Labs., Univ. of New Hampshire, Durham, NH, USA). *Vision Res. (GB)*, vol.23, no.5, p.495-505 (1983).

The threshold masking effect of one simultaneously presented grating upon another was studied as a function of mask contrast and frequency. The masking function typically obeys Weber's Law with method-of-adjustment psychophysics, and typically does not with forced-choice. This apparent discrepancy was studied in some detail. It is suggested that thresholds can be set with at least two different criteria, depending upon experimental conditions. When the mask is unfamiliar, it functions as noise and detection occurs at a constant signal/noise ratio, which yields Weber's Law. When the mask is highly familiar, its masking effect is less and obeys a power law. This power-law masking appears to represent and inherent non-linearity of the visual system. (32 refs.)

63852 Exposure duration affects the sensitivity of vernier acuity to target motion. M.J.Morgan, R.J.Watt (Dept. of Psychology, Univ. Coll. London, London, England), S.P.McKee.

Vision Res. (GB), vol.23, no.5, p.541-6 (1983).

Threshold vernier acuity was measured under different conditions of target movement and exposure duration. In the case of a simple two-line vernier target, image motion up to about 3 deg/sec had little effect upon threshold for a briefly exposed (150 msec) target, which is relatively poor even for a stationary stimulus, but produced a decrement in acuity for a continuously exposed stimulus. This finding was repeated in a second experiment, which used a centroid cue to vernier offset, and which compared the effects of horizontal and vertical orientation. It is suggested that image motion and reduced exposure duration restrict the proportion restrict the proportion of the light spread function that can be usefully sampled by the neural networks responsible for hyperacuity. (14 refs.)

63853 Practice improves adults' sensitivity to diagonals. M.J.Mayer (Univ. of California, Santa Cruz, CA, USA). *Vision Res. (GB)*, vol.23, no.5, p.547-50 (1983).

Adults who were initially less sensitive to a diagonal, 10 c/deg sinusoidal grating, practised detecting it for 3000 yes-no signal detection trials. Following practice all observers had improved their relative sensitivity to the diagonal and most were as sensitive to the diagonal as to cardinal (horizontal or vertical) orientations. Practising a cardinal axis, on the other hand, caused no improvement in sensitivity unless the pre-practice threshold for that orientation was elevated with respect to other orientations. Three hypotheses are proposed to account for the improved sensitivity. The results are also related

to the typical pattern of adult anisotropic contrast sensitivity which favors the cardinal orientations. (21 refs.)

63854 Non-astigmatic children's contrast sensitivities differ from anisotropic patterns of adults. M.J.Mayer (Univ. of California, Santa Cruz, CA, USA).

Vision Res. (GB), vol.23, no.5, p.551-9 (1983).

Monocular contrast thresholds were estimated for horizontal (H), vertical (V) and left and right diagonal 10 c/deg sinusoidal gratings for non-astigmatic children (4:10-11:2 yr) and adults using yes-no signal detection (YN) methods. Some children were also tested with two-interval forced-choice (2IFC). Younger children were less likely to have the typical adult pattern of anisotropic sensitivity, favoring H and V, while 10-11-yr-olds had more adult-like anisotropy. Within all age groups patterns of anisotropy varied considerably. Deviation of adults from the typical pattern may be related to small amounts of astigmatism in their untested eyes. 4- and 5-yr-olds were confused by 2IFC. For children 6 yr and older, 2IFC and YN threshold estimates were equivalent, but 2IFC required less testing time. (20 refs.)

63855 Measurement of factors affecting VDU readability. S.Bennett, G.Trapani (Polarizer Div., Polaroid Corp., Norwood, MA, USA).

Electronic Displays '82 and Information Display Systems, London, England, 5-7 Oct. 1982 (Buckingham, Bucks., England: Network Exhibition 1982), 14 pp.

The authors have measured contrast enhancement on three different VDUs with each of four different contrast enhancement filters. The contrast enhancement filters were of different types; circular polarizing, mesh, neutral isotropically absorbing, and spectrally selective isotropic absorbing. The results indicate that any of the four filters is useful in enhancing contrast where the contrast is being reduced by nonspecular reflections. The improvement in contrast for the case where the brightness of the reflections is about equal to the signal runs about 100% (e.g. the contrast with a filter is about double what it is without a filter). For specular, or near-specular reflections, the circular polarizing filter has a clear margin of superiority, enhancing contrast by the order of tenfold, while the other filters remain about as effective as they are for nonspecular reflections. (15 refs.)

87.34 AUDITION

63856 Influence of the time pattern of noise exposure on the acquisition of and recovery from auditory fatigue. R.Hetu (Ecole d'Orthophonie et d'Audiologie, Univ. de Montreal, Montreal, Quebec, Canada).

Rev. Acoust. (France), vol.15, no.63, p.211-15 (1982). In French.

Temporary threshold shift (TTS) is related to the time pattern of noise exposure in a relatively complex fashion. This relationship essentially involves the on-fraction, the period of intermittency and the sound level during noise bursts and quiet intervals. Data from recent studies on the influence of the exposure parameters and more specifically of their mutual interactions is reviewed. Original data are presented on the effect of the interaction between the on-fraction and the period of intermittency on the growth of TTS and also on the effect of the ambient sound level on the recovery from TTS. The predictability of TTS is examined in the context of both laboratory and real life conditions. The implications for the time-intensity trade-off in occupational noise exposure limits and for administrative control of exposure is discussed. (35 refs.)

63857 Auditory nerve-brain stem evoked potentials in cats during manipulation of the cerebral perfusion pressure. H.Sohmer, M.Gafni, K.Goitein, P.Fainmesser (Dept. of Physiology, Hebrew Univ., Jerusalem, Israel).

Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.2, p.198-202 (Feb. 1983).

In order to study the effects of various degrees of cerebral ischemia on the auditory nerve-brain stem evoked potentials (BAEP), the cerebral perfusion pressure (CPP), defined as the difference between mean arterial blood pressure (MAP) and intracranial pressure (ICP), was systematically manipulated in anesthetized, paralyzed and ventilated cats. The CPP was varied by decreasing MAP, either by hemorrhage or by the infusion of a vasodilating drug, and elevating ICP by infusion of mock CSF into the cisterna magna, or by MAP depression and ICP elevation simultaneously. The EEG and BAEP became isoelectric far below the range of autoregulation of cerebral blood flow (CBF) so that the brain stem auditory pathway is still capable of generating its electrical response (BAEP) at very low CBF. This is paradoxical since these same regions of the brain have been shown to have the highest levels of regional metabolism as shown by their very high local cerebral blood flow and local glucose utilization. (8 refs.)

63858 Post-stimulatory effects on the auditory brain stem response: partial-masking and enhancement. A.K.Ananthanarayan, G.M.Gerken (Callier Center for Communication Disorders, Univ. of Texas, Dallas, TX, USA).

Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.2, p.223-6 (Feb. 1983).

The auditory brain stem response (ABR) was recorded in human subjects using the stimulus configuration of a tone-on-tone forward-masking paradigm, but with all stimuli at suprathreshold levels. A masking stimulus preceded, by Δt msec, the probe stimulus which elicited the ABR. The latency vs. Δt functions for waves III and V were essentially parallel to each other and were interpreted in terms of a partial forward-masking effect, possibly originating in the cochlea. Likewise, the amplitude function for wave III showed varying degrees of decrement as a function of Δt that was also compatible with a partial forward-masking interpretation. In contrast, wave V showed an amplitude increment relative to the unmasked wave that was maximal for Δt values of 15 and 45 msec. The amplitude increment in wave V was termed enhancement and was interpreted as a central process governed by the timing of sound sequences. (17 refs.)

63859 Measurement and analyzing of fatigue by the use of the newly devised acoustical method in comparison with the optical method of fatigue analysis by the flicker fusion technique. S.Kondo (Hitachi Ltd., Tokyo, Japan).

J. Acoust. Soc. Jpn. (Japan), vol.38, no.12, p.764-73 (Dec. 1982). In Japanese.

According to the acoustical method, a 2 kHz pure tone that travels with a duration of 20 msec followed by another tone of the same frequency is given as the acoustical stimulus, and the time interval between the two is adjusted in such a way as to bring about psychological fusion of the two tones, each subject being asked to give his differential threshold value τ_m . The subject's differential threshold value ϕ_m of the flicker fusion technique is also obtained. The analysis of the relation between the degree of fatigue and τ_m and ϕ_m indicates that τ_m and ϕ_m are both related to the degree of fatigue and that the τ_m and the ϕ_m stand almost in the reverse relation to each other as to the fatigue degree. Factors that contribute to τ_m or ϕ_m are analyzed and the degree of their contribution is determined by the quantification theory. τ_m and

ϕ_m have generally negative correlation coefficients to each other, but as to the fatigue state, they stand to each other in positive relations. The average τ_m per day of the week and the frequency of incidence of fatigue per day of the week stand in correlational relations to each other, but the correlation coefficients of τ_m are greater for young adolescents while those of ϕ_m tend to be greater for older people. (14 refs.)

63860 Psychological study on L_{eq} as a measure of loudness of various kinds of noises. S.Namba, S.Kuwano (Osaka Univ., Toyonaka, Japan).

J. Acoust. Soc. Jpn. (Japan), vol.38, no.12, p.774-85 (Dec. 1982). In Japanese.

The application of L_{eq} as a measure of loudness of various noises is investigated. Nine kinds of noise sources, -aircraft noise, super express train, noise, train noise, road traffic noise, speech, music, impulsive noise, artificial level-fluctuating noise and steady noise-are used as stimuli. The duration is about 10 sec except impulsive noise. Four kind levels are used in each noise source, therefore 36 stimuli are contained in a stimulus series. They are presented in random order and their loudnesses are judged by magnitude estimation. As a result of the experiment, it is found that L_{eq} can be used as a good measure of the loudness of various noises as a first approximation. Strictly speaking, however, there is a slight, but systematical deviation from L_{eq} in PSE's of some noise sources. This fact suggests that it is necessary to add some factors to L_{eq} in order to decide the permissible levels of these noise sources. (60 refs.)

63861 Two-component hearing sensations produced by two-electrode stimulation in the cochlea of a deaf patient. Y.C.Tong, R.C.Dowell, P.J.Blamey, G.M.Clark (Dept. of Otolaryngology, Univ. of Melbourne, Parkville, Victoria, Australia).

Science (USA), vol.219, no.4587, p.993-4 (25 Feb. 1983).

Dissimilarities in perception elicited by stimulation with two electrodes were estimated. A two-dimensional spatial configuration was found to be suitable to represent the dissimilarity data, and the two dimensions could be interpreted as corresponding to the position of the apical and basal electrode of the two-electrode combination. A speech-processing strategy that converts acoustic, first and second formants to two-electrode stimulation is proposed. (12 refs.)

63862 Temporal selectivity in the central auditory system of the leopard frog. G.Rose, R.R.Capranica (Cornell Univ., Ithaca, NY, USA).

Science (USA), vol.219, no.4588, p.1087-9 (4 March 1983).

Amplitude modulation is a predominant temporal feature in many vocal signals. The leopard frog, *Rana pipiens*, has a class of neurons in the central auditory system that respond selectively to particular rates of amplitude modulation; these neurons can be characterized by a temporal tuning curve. Such selectivity is absent in the peripheral auditory system. This type of transformation may be fundamental in processing temporal information in the vertebrate sensory nervous system. (15 refs.)

63864 Intrapulmonary CO_2 receptor discharge at different levels of venous PCO_2 . R.D.Tallman, Jr., F.S.Grodins (Dept. of Biomedical Engng., Univ. of Southern California, Los Angeles, CA, USA).

J. Appl. Physiol. (USA), vol.53, no.6, p.1386-91 (Dec. 1982). [received: April 1983]

It has been suggested that avian intrapulmonary CO_2 -sensitive receptors (IPC) may be capable of affecting ventilation in response to changes in lung CO_2 load. The purpose of this study was to record IPC discharge activity in spontaneously breathing ducks when venous Pco_2 was elevated or lowered from resting levels. This was accomplished using an extracorporeal venovenous blood bypass circuit, which included a 0.8-m^2 silicone membrane blood oxygenator. Adult male Pekin ducks were anesthetized and tracheostomized. Single-unit activity was recorded from 42 IPC. During venous CO_2 loading, there was no difference in the average IPC discharge from control despite an increase in the rate of CO_2 excretion (V_{CO_2}) to twice the resting level. Venous CO_2 unloading decreased V_{CO_2} by one-half but did not significantly affect inspiratory IPC discharge and resulted in only a small increase in expiratory discharge. In contrast, inhalation of 3% CO_2 greatly reduced inspiratory discharge. Reflex adjustments in tracheal flow appear to be responsible for maintaining IPC discharge at control levels when venous Pco_2 changes. (18 refs.)

63865 Sensation of inspired volume in normal subjects and quadriplegic patients. A.F.DiMarco, D.A.Wolfson, S.B.Gottfried, M.D.Altose (Dept. of Medicine, Case Western Reserve Univ., Cleveland, OH, USA).

J. Appl. Physiol. (USA), vol.53, no.6, p.1481-6 (Dec. 1982). [received: April 1983]

To investigate the influence of respiratory muscle tension and feedback from rib cage receptors, the sensation of inspired volume was compared in normal subjects and quadriplegic patients during active breathing, with and without the addition of an inspiratory resistive load, and during passive ventilation produced by a tank respirator. In separate trials, volume sensation was assessed using tests of magnitude estimation and volume reproduction. The mean exponents and standard errors for the magnitude estimation of inspired volume in normal subjects were 1.32 ± 0.08 , 1.24 ± 0.06 , and 1.23 ± 0.09 during passive, active, and loaded breathing, respectively. These values were not significantly different from one another, nor were there any differences between normal subjects and quadriplegics. It is suggested that the upper airway receptors are not essential for volume sensation. The intensity of the sensation of a given inspired volume may depend on the level of the central nervous system motor command and/or on the tension developed by the diaphragm. (16 refs.)

63866 Central and peripheral chemoreceptor inputs to phrenic and hypoglossal motoneurons. E.N. Bruce, J. Mitra, N.S. Cherniack (Dept. of medicine, Case Western Reserve Univ., Cleveland, OH, USA).

J. Appl. Physiol. (USA), vol.53, no.6, p.1504-11 (Dec. 1982). [received: April 1983]

The hypothesis that phrenic and hypoglossal responses to progressive hypercapnia differ qualitatively because of the CO_2 -related drive inputs to their respective motoneuron pools are different was tested. The relative contributions of carotid sinus and central chemoreceptor inputs to hypoglossal and phrenic responses during hyperoxic hypercapnia were determined by comparing the two nerve activities during rebreathing runs done either before and after bilateral carotid sinus nerve (CSN) section, or without and with cooling of the intermediate, I(s), area on the ventral surface of the medulla. The studies were performed on chloralose-anesthetized, vagotomized, paralyzed cats. Cooling of the I(s) area impaired phrenic responsiveness to hypercapnia more than hypoglossal responsiveness, whereas CSN section had the opposite effect. Thus phrenic nerve response was more dependent on central chemoreceptor input than was the hypoglossal response, but hypoglossal response was more dependent on carotid sinus chemoreceptor input. It is concluded that the phrenic and hypoglossal motoneuron pools each receive a different functional input from both the medullary and the carotid sinus chemoreceptors. (23 refs.)

63867 Simulation analysis of interatrial transposition of venous return (Mustard's operation). E.H. Blackstone (Dept. of Surgery, Univ. of Alabama, Birmingham, AL, USA), V.C. Rideout, D.L. Beduhn.

Ann. Biomed. Eng. (USA), vol.10, no.5, p.193-218 (1982).

Transposition of the great arteries is functionally corrected by Mustard's operation, an operation in which the atrial septum is removed and the resulting common atrial chamber repartitioned by a baffle to transpose venous return to the heart. To better understand the new physiology, a physically-based mathematical model of the infant circulation following Mustard's operation was developed and studied with the aid of computer simulation. The model reproduces certain clinical observations, including the tendency for mean pressure in both atria to be equal early postoperatively and for the pressure waveform to exhibit a steep y-descent in the systemic venous atrium. Simulation studies suggest that the mechanism for the former is transbaffle pressure coupling resulting from dynamic motion of the baffle; the mechanism for the latter is limitation of the extent of such baffle excursions. Dynamic volume of the two atria is found in the model to change according to the relative performance of the two ventricles, and stiffening the baffle leads to pressure waveforms characteristic of a small, noncompliant atrium. Mechanisms for venous 'obstruction' and decompression were also studied. The baffle and its movements, however, have little effect upon cardiac output in the model, leaving unexplained the clinical observation of low output early postoperatively. (23 refs.)

63868 Mathematical studies on particle paths in an aneurysm. H. Florian, K. Perktold, K. Gruber (Inst. für Math., Tech. Univ. Graz, Graz, Austria).

Biomed. Tech. (Germany), vol.28, no.4, p.83-90 (April 1983). In German.

The experimental visualization of streamline patterns by the injection of contrast material is useful under conditions of steady flow. In the case of pulsatile flow, however, complicating problems occur. In these cases appropriate mathematical methods provide useful results for particle paths. The authors use the results of their earlier calculations of pulsatile flow through an aneurysm model. Particle paths are examined quantitatively and compared for the physiological and an idealized pulse. The starting points and starting time are varied. The results demonstrate the time-dependent development, shift and disappearance of vortices during a pulsatile cycle and provide hints on zones of stasis. This is a significant factor in thrombogenesis. (9 refs.)

63869 Effects of velocity jumps on blood flow in large arteries. V.K. Sud (Dept. of Biophys., All India Inst. of Medical Sci., New Delhi, India), G.S. Sekhon, R.K. Mishra.

J. Biol. Phys. (USA), vol.10, no.3, p.179-86 (1982).

When a human being experiences a sudden velocity change, the blood flow is disturbed. A theoretical analysis to predict the effects of sudden velocity changes on blood flow in large arteries is presented. The situation is modelled as a one-dimensional flow problem in a viscoelastic tube where the fluid viscosity convective term in the equation of motion and nonlinearity in the elastic modulus of the tube wall are neglected. The governing equations of the model are solved by the Laplace transformations. The computed results show that relatively high blood pressures, capable of harming circulation, are produced even by relatively moderate velocity jumps. (5 refs.)

63870 Is the arterial pulse a soliton? S. Rowlands (Faculty of Medicine, Univ. of Calgary, Calgary, Alberta, Canada).

J. Biol. Phys. (USA), vol.10, no.4, p.199-200 (1982).

The recent discovery of arterial smooth muscle contractions which are synchronized with the activity of the right atrial pacemaker in the rabbit heart gives support to the hypothesis that the arterial pulse wave is a soliton. The hypothesis is amenable to experimental tests. (11 refs.)

63871 Pulmonary blood flow distribution in panting ostriches. J.H. Jones (Percy FitzPatrick Inst. of African Ornithology, Univ. of Cape Town, Rondebosch, S. Africa).

J. Appl. Physiol. (USA), vol.53, no.6, p.1411-17 (Dec. 1982). [received: April 1983]

Ostriches (*Struthio camelus*) are the only birds known that can increase post-dead space ventilation during severe heat stress without experiencing hypocapnia and respiratory alkalosis. To determine whether this phenomenon occurs due to redistribution of pulmonary blood flow during panting, thus creating an extreme ventilation-perfusion (\dot{V}/\dot{Q}) imbalance, the distributions of pulmonary blood flow in ostriches at rest (15°C) in a severe panting (45°C) were determined using radioactively labeled microspheres. Blood flow distribution at rest was greatest in the neopulmo [$18\% > \text{mean pulmonary blood flow (MPBF)}$] and the cranial ($23\% > \text{MPBF}$) and distal ($12\% > \text{MPBF}$) regions of the paleopulmo. During panting blood flow was not shunted around the lung, and flow to the neopulmo decreased to MPBF, became more homogeneous along the cranio-caudal axis, and remained nonhomogeneous along the medio-lateral axis. The results suggest that the observed decrease in gas exchange during panting is probably due primarily to shunting

of the increased ventilation around the parabronchial exchange region rather than to alterations in the patterns of \dot{V}/\dot{Q} within the lung. (44 refs.)

63872 A Starling resistor regulates cerebral venous outflow in dogs. J.M. Luce, J.S. Huseby, W. Kirk, J. Butler (Div. of Respiratory Diseases, Univ. of Washington School of Medicine, Seattle, WA, USA).

J. Appl. Physiol. (USA), vol.53, no.6, p.1496-503 (Dec. 1982). [received: April 1983]

This investigation was undertaken to determine whether a Starling resistor or venous waterfall effect exists between the sagittal sinus and the cerebral veins such that increases in sagittal sinus pressure (Pss) do not abolish cerebral venous outflow and examine two possible contributions of extracranial venous valves in regulating outflow. Anesthetized dogs were subjected to positive end-expiratory pressure (PEEP) before and after intracranial pressure (Pic) was elevated by inflation of an epidural balloon. It is concluded that a Starling resistor between the sagittal sinus and the cerebral veins regulates cerebral venous outflow when Pss is increased by PEEP and other maneuvers that raise superior vena caval pressure (Pscv). The waterfall maintains cerebral venous pressure and Pic at normal levels when Pscv and Pss are reduced. Extracranial venous valves are not essential to this mechanism. (12 refs.)

63873 Surface tension-surface area curves calculated from pressure-volume loops. T.A. Wilson (Dept. of Aerospace Engng. & Mech., Univ. of Minnesota, Minneapolis, MN, USA).

J. Appl. Physiol. (USA), vol.53, no.6, p.1512-20 (Dec. 1982). [received: April 1983]

An energy analysis and data from the literature on the relation among surface area, recoil pressure, and lung volume are used to calculate the surface tension-surface area curves corresponding to pressure-volume loops. The energy analysis has been described earlier (see *ibid.*, vol.50, p.921-6, 1981). It is based on the assumption that the tissue structure of the lung constitutes a conservative mechanical system and hence that pressure-volume hysteresis. Unlike previous methods of calculating surface tension from recoil pressure, this method does not rely on the assumption that the tissue component of recoil in the air-filled lung is the same as recoil pressure of the saline-filled lung at the same lung volume. The calculated values of surface tension decrease to less than 2 dyn/cm as surface area decreases along the deflation limb of the pressure-volume curve. Surface tension increases very steeply with surface area on the inflation limbs, reaching a limiting value of just under 30 dyn/cm. The shape of the surface tension-surface area curves, unlike the shape of the curves calculated by previous methods, is similar to the shape obtained on surface tension balances for fluid extracted from lungs. (14 refs.)

63874 Pulmonary microcirculatory response to localized hypercapnia. T. Koyama, M. Horimoto (Res. Inst. of Appl. Electricity, Hokkaido Univ., Sapporo, Japan).

J. Appl. Physiol. (USA), vol.53, no.6, p.1556-64 (Dec. 1982). [received: April 1983]

Anesthetized bullfrogs were examined to study the effects of localized hypercapnia on the red blood cell (RBC) velocity in pulmonary alveolar microvessels on the exposed lung surface. Before and after the exposure of a small area of the lung surface 6 mm in diameter to a hypercapnic gas mixture, the region was exposed to CO_2 -free control gas. The RBC velocity was measured by the use of a laser Doppler microscope. Both mean flow velocity (MV) and pulsatile amplitude (PA) were determined from the resulting flow velocity contour. Responses of pulmonary microvessels to hypercapnia were examined by measuring the vessel diameters with an ocular microscope of the microscope while gas mixtures were applied to a 1-mm-diameter region of the surface. During hypercapnia both MV (2.31 ± 0.27 mm/s) and PA (0.54 ± 0.15 mm/s) in the alveolar arterioles ($\phi = 64 \pm 14 \mu\text{m}$) were reduced, each reaching a minimum (2.01 ± 0.24 and 0.43 ± 0.19 mm/s, respectively) prior to gradual returns to their initial values. After reintroduction of the control gas, the values of MV and PA approached initial values more rapidly. In capillaries MV (1.44 ± 0.18 mm/s) and PA (0.28 ± 0.06 mm/s) decreased to 1.25 ± 0.10 and 0.15 ± 0.05 mm/s, respectively. The maximum reduction of PA (-44.6%) therefore clearly exceeded that of MV (-12.4%) in capillary flow. (19 refs.)

63875 Attenuation of hypoxic pulmonary vasoconstriction by pulsatile flow in dog lungs. T.J. Gregory, J.C. Newell, T.S. Hakim, M.G. Levitzky, N. Sedrak (Center for Biomedical Engng., Rensselaer Polytech. Inst., Troy, NY, USA).

J. Appl. Physiol. (USA), vol.53, no.6, p.1583-8 (Dec. 1982). [received: April 1983]

Pulmonary arterial pressure was measured in isolated lower lobes of dog lungs perfused in situ at several flows during ventilation with 95% O_2 -5% CO_2 and with 3% O_2 -5% CO_2 . Pulsatile perfusion was provided by a piston pump, and steady perfusion was provided by a roller pump, and steady perfusion was provided by a roller pump. The slope of the pressure-flow curve was 16.1 ± 1.6 Torr $\cdot \text{l}^{-1} \cdot \text{min}$ at all flows between 200 and 800 ml/min during 95-5 ventilation and increased to 19.4 ± 3.7 in hypoxia. When flow was 600 ml/min, with 95-5 ventilation, mean arterial pressure was 16.2 ± 1.2 Torr in steady flow and was unchanged at 15.0 ± 1.0 Torr in pulsatile flow. At the same flow during hypoxic ventilation, mean arterial pressure was 16.2 ± 1.2 Torr in steady flow and was unchanged at 15.0 ± 1.0 Torr in pulsatile flow. At the same flow during hypoxic ventilation, mean arterial pressure increased to 27.9 ± 2.4 Torr ($P < 0.01$) when flow was steady but only to 19.3 ± 1.6 Torr ($P < 0.01$) when flow was made pulsatile. Thus hypoxia increased perfusion pressure by a nearly parallel shift of the pressure-flow curve to higher pressures, and this change was smaller in pulsatile than in steady flow. (22 refs.)

63876 Comparison of hemodynamic responses to static and dynamic exercise. G.R. Bezucha, M.C. Lenser, P.G. Hanson, F.J. Nagle (Biodynamics Lab., Univ. of Wisconsin-Madison, Madison, WI, USA).

J. Appl. Physiol. (USA), vol.53, no.6, p.1589-93 (Dec. 1982). [received: April 1983]

Eight healthy male adults (25-34 yr) were studied to compare hemodynamic responses to static exercise (30% MVC in leg extension), static-dynamic exercise (one-arm cranking, 66 and 79% $\dot{V}_{\text{O}_{2\text{max}}}$), and dynamic exercise (two-leg cycling, 58 and 82% $\dot{V}_{\text{O}_{2\text{max}}}$). One-arm cranking and two-leg cycling at similar relative \dot{V}_{O_2} demands resulted in nearly identical increases in mean arterial pressure (Pa) due to different contributions of cardiac output (Q) and total peripheral resistance Q and the arteriovenous O_2 difference varied as a function of \dot{V}_{O_2} regardless of the mode of exercise (static or dynamic). On the other hand, the heart rate response, which accounted for increased Q in the exercises containing a static component, and Pa varied with mode of exercise. Any generalized scheme of cardiovascular control during exercise must account for the potential influence of dynamic and static components of the exercise. (18 refs.)

63877 Canine thoracic electrical impedance with changes in pulmonary gas and blood volumes. R.M.Smith, B.A.Gray (Dept. of Medicine, Univ. of Oklahoma Health Sci. Center, Oklahoma City, OK, USA).

J. Appl. Physiol. (USA), vol.53, no.6, p.1608-13 (Dec. 1982). [received: April 1983]

Transthoracic impedance (Z) was evaluated as an index of total lung liquid content at constant lung gas volume (LGV). Rapid changes in pulmonary blood volume (PBV) were produced in anesthetized, paralyzed, closed-chest dogs with the airway occluded at functional residual capacity. Changes in PBV produced by inflation of balloons on catheters positioned in the left atrium (LA) or inferior vena cava (IVC) were estimated from the changes in chest wall recoil pressure, using the chest wall as a plethysmograph after calibration with changes in LGV. Whereas Z increased linearly with decreases in PBV (1-6 ml/kg) produced by the IVC balloon ($\Delta Z/\Delta PBV = -0.43$ ml/kg, $r = -0.81$), Z did not change significantly with increases in PBV (1-6 ml/kg) produced by the LA balloon. These observations indicate that changes in PBV are not the primary determinant of changes in Z and raise the possibility that other hemodynamic events are more important. (23 refs.)

63878 Airway smooth muscle mechanics: reduced activation and relaxation. U.Kromer, N.Stephens (Dept. of Physiology, Univ. of Manitoba, Winnipeg, Manitoba, Canada).

J. Appl. Physiol. (USA), vol.54, no.2, p.345-8 (Feb. 1983).

Reduced activation of skeletal muscle fibers at below-optimal lengths has been reported before. The authors studied tracheal smooth muscle (TSM) as a model of airway smooth muscle to see whether such a phenomenon existed in smooth muscle also; they found that active length-tension curves at normal and raised Ca^{2+} concentrations were significantly different. This indicated reduced activation of the TSM at below-optimal lengths. This reduction was in addition to that arising from the length-tension effect. The authors also studied the mechanics of relaxation in TSM and noted that in afterloaded isotonic tension records the time course of TSM relaxation appeared to closely follow that of the isometric contraction at all loads. In this it differed markedly from relaxation in skeletal muscle where the time courses of relaxation at different loads differed from each other and from that of the isometric muscle. (15 refs.)

63879 Decay of inspiratory muscle pressure during expiration in anesthetized cats. W.A.Zin, L.D.Pengelly, J.Milic-Emili (Dept. of Physiology, McGill Univ., Montreal, Quebec, Canada).

J. Appl. Physiol. (USA), vol.54, no.2, p.408-13 (Feb. 1983).

In six spontaneously breathing anesthetized cats (pentobarbital sodium, 35 mg/kg) the authors studied the antagonistic pressure developed by the inspiratory muscles during expiration (Pmus). This was accomplished in two ways: (1) with the authors' previously reported method (see *ibid.*, vol.52, p.1266-71, 1982) based on the measurement of changes in lung volume and airflow during spontaneous expiration, together with determination of the total passive respiratory system elastance and resistance; and (2) measurement of the time course of changes in tracheal pressure after airway occlusion at end inspiration, up to the moment when the inspiratory muscles become completely relaxed. The agreement between the two methods is generally good, both in the amplitude of Pmus, and in its time course. The authors also applied the first method to spontaneous expirations through added linear resistive loads. These did not alter the relative decay of Pmus. Thus in anesthetized cats the braking action of the inspiratory muscles does not decrease when expiratory resistive loads are added, i.e., when such braking is clearly not required. (20 refs.)

63880 High-frequency oscillations via the pleural surface: an alternative mode of ventilation? H.E.Ward, J.H.T.Power, T.E.Nicholas (School of Medicine, Flinders Univ. of South Australia, Bedford Park, Australia).

J. Appl. Physiol. (USA), vol.54, no.2, p.427-33 (Feb. 1983).

High-frequency oscillatory ventilation (HFOV) of low amplitude was applied to the pleural surface of the isolated rat lung (IPL) perfused at 10 ml.min⁻¹ with Krebs bicarbonate containing 4.5% albumin (hematocrit 34%). Lung volume was held constant by a continuous positive airways pressure (CPAP) of 5 cmH₂O. Varying CPAP from 2 to 15 cm H₂O did not affect O₂ uptake. Tidal volume (V_T) was estimated with an impedance pneumograph, and it bore a direct linear relationship to the amplitude of both the loudspeaker input signal and the pressure change in the chamber up to 30 Hz; V_T was inversely proportional to the frequency (f). However, at a constant loudspeaker input of 10 V, minute expired ventilation (\dot{V}_E) remained constant (mean 104 ml.min⁻¹) as f increased from 5 to 30 Hz. Hemoglobin saturation increased by more than 80% during HFOV of 5-40 Hz and amplitude of 10 V, the maximum O₂ uptake being 14.6 ml O₂ per 100 ml perfusate. Whereas dead space was approximately 335 μ l, a V_T of less than 40 μ l could effect normal O₂ uptake, suggesting that bulk flow is playing only a minor role in gas exchange. HFOV for 60 min (CPAP 5 cm H₂O) did not affect the amount of alveolar surfactant compared with conventional ventilation at the same mean airway pressure. It is concluded that normal O₂ uptake can be maintained by applying HFOV to the pleural surface of the IPL held at constant volume. (26 refs.)

63881 Dynamic response of local pulmonary blood flow to alveolar gas tensions: analysis. B.J.B.Grant, A.M.Schneider (Dept. of Medicine, Univ. of California, San Diego, La Jolla, CA, USA).

J. Appl. Physiol. (USA), vol.54, no.2, p.445-52 (Feb. 1983).

It has been reported that left lower lobe pulmonary blood flow (Q) and alveolar CO₂ decrease then oscillate in a progressively damped manner when the lobar inspirate is changed from pure O₂ to N₂. This damped oscillatory response of lobar Q is abolished by maintaining lobar CO₂ constant. The authors set out to develop the simplest mathematical model that can simulate these experimental results by using techniques derived from control theory. Different models were tested. The simplest model that predicts the experimental data incorporates an exponential decrease of lobar Q to local alveolar hypoxia (time constant 3 min) and a damped oscillatory response of lobar Q to local alveolar hypocapnia. The response to hypocapnia has two components: a vasodilator effect possibly related to intracellular [H⁺] and a vasoconstrictor effect possibly related to changes of molar CO₂. Both these components (time constants of 4.8 min) interact with each other by cross-coupled elements (time constants of 4.8 min). This model can be used to forecast results so that its validity can be tested by experiment. (27 refs.)

63882 Effects of high-frequency oscillatory ventilation on vagal and phrenic nerve activities. G.C.W.Man, S.F.P.Man, C.T.Kappagoda (Dept. of Medicine, Univ. of Alberta, Edmonton, Alberta, Canada).

J. Appl. Physiol. (USA), vol.54, no.2, p.502-7 (Feb. 1983).

This study was undertaken to define the mechanism for the respiratory inhibition observed during high-frequency oscillatory ventilation (HFOV). The effects of HFOV on the activities of single units in the vagus (Vna) and phrenic nerves (Pna) were examined in pentobarbital-anesthetized dogs. The animals were either ventilated by intermittent positive-pressure ventilation (IPPV) with and without positive end-expiratory pressure (PEEP), or by

HFOV at a frequency of 25 Hz and pump displacement volume of 3 ml/kg. In 13 vagal units the Vna was much higher during HFOV than during IPPV or airway occlusion at a matched airway pressure. Ten units in the phrenic nerves were examined, and Pna (expressed as bursts/min) was attenuated by HFOV in all of them. In four of them, the effect of cooling the vagi to 8-10°C on Pna was examined, and it was found that HFOV failed to alter the Pna. It is concluded that 1) HFOV stimulates the pulmonary vagal afferent fibers continuously and to a degree greater than that due to static lung inflation and increased airway pressure and 2) the increased vagal activity during HFOV probably causes phrenic nerve activity inhibition. (18 refs.)

63883 Breathing He-O₂ shifts the lung pressure-volume curve of the dog. N.Berend, K.L.Christopher, N.F.Voelkel (Pulmonary Physiology Unit, Nat. Jewish Hospital & Res. Center, Denver, CO, USA).

J. Appl. Physiol. (USA), vol.54, no.2, p.576-81 (Feb. 1983).

To determine whether breathing a mixture of 80% He-20% O₂ affects the lung pressure-volume (PV) curve, eight anesthetized paralyzed dogs were studied in a volume-displacement plethysmograph. Static PV curves on air were compared with PV curves obtained after equilibration with He-O₂. The He-O₂ PV curves were significantly shifted upward by an average of 5% total lung capacity. There was no change in compliance, indicating that the shift was due to lung expansion rather than a change in elasticity. Pretreatment of the dogs with cyclooxygenase inhibitors abolished the PV shift with He-O₂. Four dogs had PV curves recorded on air and a mixture of O₂, SF₆ and Ne, a gas mixture with the same density as air but with 45% greater viscosity. The PV curve shift was even greater than observed with He-O₂ and could again be virtually abolished with a cyclooxygenase inhibitor. These results suggest that breathing a high-viscosity gas mixture results in alveolar duct dilatation due to the release of a prostaglandin bronchodilator. This may need to be taken into account in the analysis of flow augmentation with He-O₂. (26 refs.)

63884 Shock absorption of meniscectomized and painful knees: a comparative in vivo study. A.S.Voloshin (Dept. of Engng. Sci. & Mech., Iowa State Univ., Ames, IA, USA), J.Wosk.

J. Biomed. Eng. (GB), vol.5, no.2, p.157-61 (April 1983).

The principles of a noninvasive measurement of the shock absorbing capacity of the knee are presented. Accelerometry, which has been proven to be a useful tool for noninvasive measurements in biomechanical investigation, was employed for quantitative evaluation of the knee's shock absorbing capacity by registration of bone vibrations resulting from gait. Results of the experiments show that both patients with painful knee and patients after meniscectomy suffer from insufficient shock absorbing capacity of the knee. It was found that the shock absorbing capacity of a normal knee is about 20% higher than that of a pathological one. The results indicate that while meniscectomy may reduce pain, instability, swelling, etc. in an injured knee, it cannot improve its reduced shock absorbing capacity, which eventually will lead to development of degenerative osteoarthritis. It seems that the pain syndrome is a biological reaction to severe repetitive overloading of the knee. (27 refs.)

63885 Bubble dissolution physics and the treatment of decompression sickness. T.D.Kunkle (Los Alamos Nat. Lab., Los Alamos, NM, USA), E.L.Beckman.

Med. Phys. (USA), vol.10, no.2, p.184-90 (March-April 1983).

The treatment of decompression sickness often involves both recompressing the victim and administering hyperbaric oxygen in the hope of more rapidly dissolving the bubbles which cause this malady. Although many hundreds of such treatments are conducted each year in the United States alone, the underlying physical principles governing the dissolution of such bubbles are not well understood and only empirically tested. In this paper, the authors present a mathematical theory of bubble dissolution that is verified by comparison with laboratory experiments. This theory suggests that the commonly employed treatment techniques would be only marginally effective, and that in many situations the bubbles that cause the disease cannot be adequately dissolved using existing techniques and facilities. (15 refs.)

63886 A comparison of the SACH and single axis foot in the gait of unilateral below-knee amputees. N.E.Doane, L.E.Holt (Faculty of Health Professions, Dalhousie Univ., Halifax, Nova Scotia, Canada).

Prosthet. & Orthotics Int. (Denmark), vol.7, no.1, p.33-6 (April 1983).

The gait patterns of unilateral below-knee amputees wearing prostheses with either a SACH foot or a single axis foot were compared. A temporary below-knee prosthesis was fabricated for each subject using plaster of paris and Plastazote for the socket, a pylon and an artificial foot. Eight subjects were filmed at two separate sessions, one in which the SACH foot was worn on their prosthesis and one with the single axis foot on their prosthesis. Measurements of the normal leg with a SACH foot on the prosthetic limb were compared with measurements of the normal leg with a single axis foot on the prosthesis. Measurements of the prosthetic leg with both devices were also compared. A one tailed t test ($p < .05$) was used to determine statistical significance of the results obtained in six measurements of lower limb joint angles and on the percentage of time of gait cycle for stance and swing phase of the prosthetic leg. Discussion centres on the interpretation of the results from both statistical and clinical points of view. Major differences (excepting the ankle at foot-flat) between the prosthetic devices were not found. (11 refs.)

63887 Effects of alignment variables on thigh axial torque during swing phase in AK amputee gait. G.Ishai, A.Bar (Julius Silver Inst. for Biomedical Engng., Technion, Haifa, Israel), Z.Susak.

Prosthet. & Orthotics Int. (Denmark), vol.7, no.1, p.41-7 (April 1983).

It is suggested that a major source of discomfort for above-knee amputees during the swing phase of walking is the thigh axial torque (TAT) transferred at the stump-socket interface. The relation between TAT and variations in its six relevant alignment adjustments has been investigated. A computerized routine has been established which indicates optimum choice of alignment setting, based on minimal TAT peaks. Feasibility for attenuating swing phase TAT has been demonstrated in three simulated patterns of amputee gait. As a conclusion, it is suggested that a useful clinical tool could be based on the presented alignment optimisation procedure and may be expanded to include other factors associated with swing and stance phase comfort and performance. (6 refs.)

63888 An innovations approach to cardiac hemodynamics modeling. A.-H.Rashwan, A.S.Ahmed (Systems & Biomedical Engng. Dept., Faculty of Engng., Cairo Univ., Giza, Egypt).

System Modeling and Optimization. Proceedings of the 10th IFIP Conference, New York, USA, 31 Aug.-4 Sept. 1981 (Berlin, Germany: Springer-Verlag 1982), p.869-77

A new approach to the problem of modeling the blood vessels attached to the heart, especially the pulmonary artery, is presented. The analyses are based on a dynamic nonlinear compartmental model that describes the transfer of pressure energy between two sites in that vessel. The system kernels are represented by two paths; each path contains a nonlinear network in cascade with linear dynamics followed by a nonlinear transformation. The first path

reflects the dynamic compliance of the vessel under pulsatile action. The second path represents the variations of input impedance along the cardiac cycle. An experiment with (20) patients was performed to validate the model output especially in cases with aneurysm. (16 refs.)

87.50 BIOLOGICAL EFFECTS OF RADIATIONS

(inc. effects of fields)

- 63889 Cellular spin resonance in rotating electric fields. M.Mischel, A.Voss, H.A.Pohl (Dept. of Phys., Oklahoma State Univ., Stillwater, OK, USA). *J. Biol. Phys. (USA)*, vol.10, no.4, p.223-6 (1982). Cells and certain other electrically polarizable objects can be seen to spin when in a rotating electric field. When a rotating field (from four Pt electrodes) is applied over a frequency range of 500 to 75000 Hz, living cells exhibit two or three response peaks, whereas dead cells exhibit only one response peak. Yeast (*Saccharomyces cerevisiae*) exhibit two peaks. The nature of these cellular spin resonances is under active study. (7 refs.)
- 63890 Biological effects of neutron radiation and their implications for the nuclear power industry. J.A.Dennis (Nat. Radiological Protection Board, Leeds, England). *Nucl. Energy (GB)*, vol.22, no.2, p.87-93 (April 1983). Stimulated by biophysical theories of the action of radiation on the cells of mammalian tissues, research on the effects of neutrons has been interpreted as implying that neutron radiation is about 60 times more effective than gamma radiation for the induction of tumours in rodents and for shortening their lives. This contrasts with the assumption made for protection purposes that it is only about ten times as effective. However, the same experiments can be interpreted also as implying that gamma radiation at the dose rates encountered in the workplace is five to ten times less effective than is generally assumed. Taken together these observations suggest that the real risks to humans from neutrons are comparable with the assumed risks from X- and gamma radiation. Further data are required to confirm these observations and their interpretation, and in the short term there is no need to change the current practices of radiological protection as regards neutron radiation. Nevertheless, it might be wise for long-term planning purposes to anticipate a reduction in the maximum permissible fluences of neutrons by a factor of about 3. (42 refs.)
- 63891 Tumor induction in BALB/c female mice after fission neutron or γ irradiation. R.L.Ullrich (Biology Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA). *Radiat. Res. (USA)*, vol.93, no.3, p.506-15 (March 1983). Describes the dose-response relationships for tumor induction after neutron irradiation in female BALB/c mice, with emphasis on the response in the dose range 0 to 50 rad. Tumors induced after radiation exposure included ovarian tumors, lung adenocarcinomas and mammary adenocarcinomas. For comparison the dose response for induction of these tumors after ^{137}Cs γ irradiation were also examined. As previously described for the female RFM mouse, the data for ovarian tumor induction after neutron and γ irradiation were consistent with a threshold model. For lung and mammary tumors the dose-response curve after neutron irradiation appeared to 'bend over' in the dose range 10 to 20 rad. The factors responsible for this bend-over and their relative contributions to the overall form of the dose-response relationship are not presently known. However, these data strongly indicate that extrapolation from data above 50 rad could result in a significant underestimate of risks. Further, it is clear that current models of neutron carcinogenesis are inadequate, since such a bend-over is not predicted at these low dose levels. (11 refs.)

87.50B Interactions of biosystems with radiations

- 63892 Optical polarization properties of the diffraction spectra from single fibers of skeletal muscle. Y.Yeh, B.G.Pinsky (Dept. of Appl. Sci., Univ. of California, Davis, CA, USA). *Biophys. J. (USA)*, vol.42, no.1, p.83-90 (April 1983). The diffraction spectra of laser light from single fibers of skeletal muscle exhibit a large degree of optical depolarization. When the linearly polarized incident laser source is oriented at polarization angles between $0 < \theta < \pi/2$ rad with respect to the fiber axis, the diffracted light is elliptically polarized. These results show that the phase angle of the ellipse rotates by as much as 20° when the fiber is stretched from 2.4 to 3.8 μm . To further ascertain that the observed phenomenon is diffraction related, an experimental monitoring the spectra of scattered light in between diffraction orders showed this signal to be significantly more linearly polarized. These results suggest that the degree of elliptical polarization of the diffraction spectra is a sensitive probe of A-band dynamics, including changes of the anisotropic S-2 elements. (22 refs.)

87.50C Bioacoustics (sonic and ultrasonic effects on living matter)

- 63893 Safety criterion for pressure wave. Liang Zhi-an, Feng Jun-ming (Shanghai Inst. of Physiology, Acad. Sinica, Shanghai, China), Meng Zhao-hui, Ye Si-mao, Cheng Ming-kun, Zhou Yong-shen, Li Xing-qi, Song Fu-zhi, Wang Zheng-guo, Zheng Shi-gang. *Acta Acust. (China)*, vol.7, no.6, p.372-9 (Nov. 1982). In Chinese. A safety criterion for the pressure wave generated by artillery and other explosive weapons was worked out by a joint research scheme consisting of (1) making a detailed study of the physical properties of such waves and, through animal experiments, revealing the rules that govern their damaging effect; (2) finding out the principal parameters of the pressure wave that determine the condition and degree of damage and formulating a safety margin for the tested animals in terms of these parameters; (3) determining the pressure wave tolerance difference between the human body and that of the tested animal through a number of well controlled contrast experiments and then (4) drafting a preliminary safety criterion on the basis of (3) for the verification of its reliability and fitness in actual cases of exposure. (17 refs.)
- 63894 Response of multicell spheroids to 1-MHz ultrasonic irradiation: cavitation-related damage. P.G.Sacks, M.W.Miller, R.M.Sutherland (Dept. of Radiation Biology & Biophys., Univ. of Rochester, School of Medicine & Dentistry, Rochester, NY, USA). *Radiat. Res. (USA)*, vol.93, no.3, p.545-59 (March 1983). The response of EMT6/Ro single cells and multicell spheroids (150-800 μm diameter) to 1-MHz ultrasonic radiation was determined for intensities of 0.5 W/cm² for 1-5 min. Damage was assessed by evaluating both lysis and survival of individual spheroid cells, growth of whole spheroids, and the physical integrity of whole spheroids by histological and scanning electron microscopic techniques. The surviving fraction of spheroid cells was higher than that of single cells, and several of the intensity-duration combinations showed a statistically significant correlation between resistance to ultrasound and increased spheroid size. This resistance with size was also found in spheroid growth experiments. Histological sections showed that both peripheral and internal damage occur. The relationship damage to studies of effects on tissues and possible therapeutic use of nonthermal ultrasound are discussed. (20 refs.)
- Distortion of finite amplitude ultrasound in lossy media See Entry 61334

87.50E Bio-optics (effects of microwaves, light, laser and other electromagnetic waves)

- 63895 In vivo photoacoustic spectra of *Raphanus* and *Tradescantia* leaves taken at different chopping frequencies of the excitation light. C.Buschmann (Botanisches Inst., (Pflanzenphysiologie), Karlsruhe. Univ. Karlsruhe, Germany), H.Prehn. *Photobiochem. & Photobiophys. (Netherlands)*, vol.5, no.2, p.63-9 (Feb. 1983). By varying the modulation frequency of the excitation light, spectra of the different cell layers can be taken. According to the theory of Rosenzweig and Gersho (J. Appl. Phys., vol.47, p.64-9, 1976) photoacoustic spectra are received from deeper inside the sample when the chopping frequency is decreased. By increasing the modulation frequency of the excitation light, the chlorophyll and carotenoid bands for the *Raphanus* leaves become smaller; for the *Tradescantia* leaves a long wavelength chlorophyll peak disappears leaving two maxima of the flavonoids contained exclusively in the epidermis. (13 refs.)
- 63896 Thermal effects of laser radiation in biological tissue. L.Cummins (Dominican Santa Cruz Hospital, Santa Cruz, CA, USA), M.Nauenberg. *Biophys. J. (USA)*, vol.42, no.1, p.99-102 (April 1983). A theoretical model is presented that simulates the thermal effects of laser radiation incident on biological tissue. The multiple scattering and absorption of the laser beam and the thermal diffusion process in the tissue are evaluated by a numerical technique that is well suited for microcomputers. Results are compared with recent empirical observations. (14 refs.)
- 63897 Temperature and adrenocortical responses in rhesus monkeys exposed to microwaves. W.G.Lotz, R.P.Podgorski (Naval Aerospace Medical Res. Lab., Naval Air Station, Pensacola, FL, USA). *J. Appl. Physiol. (USA)*, vol.53, no.6, p.1565-71 (Dec. 1982). [received: April 1983] To determine if the endocrine response to microwave exposure was similar in a primate to that reported for other animals, rectal temperature and plasma levels of cortisol, thyroxine (T_4), and growth hormone (GH) were measured in rhesus monkeys exposed to 1.29 GHz microwave radiation. Exposures were carried out under far-field conditions with the monkey restrained in a chair. Incident power densities of 0, 20, 28, and 38 mW/cm² were used, with corresponding specific absorption rates of 0, 2.1, 3.0, and 4.1 W/kg. Blood samples were taken hourly via an indwelling jugular venous catheter over a 24-h period before, during, and after an 8-h exposure. Rectal temperature increased an average of 0.5, 0.7, and 1.7°C for the three intensities used. No changes in T_4 or GH were observed. Cortisol levels were increased during exposure to 38 mW/cm². It was concluded that the temperature and adrenocortical responses to microwave exposure of the rhesus monkey are similar to the corresponding responses of other animals. (20 refs.)

63898 Cytogenetic effects of argon laser irradiation on Chinese hamster cells. M.Nakajima (Inst. of Medical Electronics, Univ. of Tokyo, Tokyo Japan), M.Fukuda, T.Kuroki, K.Atsumi.
Radiat. Res. (USA), vol.93, no.3, p.598-608 (March 1983).
The cytogenetic effects of argon laser light on V79 Chinese hamster cells were studied. Irradiation with a defocused continuous beam from an argon laser at doses of 100 to 400 J/cm² had dose-related cytostatic and cytotoxic effects. Cell cycle analysis by flow cytofluorometric measurement indicated that argon laser irradiation induced a temporary block at the G2+M phase. The survival curve after laser irradiation was exponential without an initial shoulder and the D₀ value (34% lethal dose) was calculated as 170 J/cm². A significant increase in sister chromatid exchange was observed after laser irradiation. Laser irradiation also induced chromatid and chromosome aberrations, most of which were breaks and gaps. These chromosomal changes are probably not an artifact of the experimental procedures such as the use of phenol red and antibiotics or spontaneously emitted UV light. No mutation at the Na⁺/K⁺-dependent ATPase locus was induced by argon laser irradiation. Although the mechanism by which an argon laser beam induced cytogenetic damage remains to be investigated, the possible involvement of hyperthermia seemed to be excluded. (26 refs.)

87.50G Ionizing radiations (u.v., X-ray, gamma-ray; particle radiation effects)

63899 Mathematical model of normal tissue injury in γ -beam therapy. S.A.Belov, F.M.Lyass, R.G.Mamin, E.I.Minakova, S.A.Raevskaya.
Med. Radiol. (USSR), vol.28, no.3, p.75-80 (March 1983). In Russian.
A model of normal tissue injury as a result of exposure to ionizing radiation is based on an assumption that the degree of tissue injury is determined by the degree of destruction by certain critical cells. The dependence of the number of lethal injuries on a single dose is expressed by a trinomial, obtained as a result of processing the experimental data. Quantitative correlations have been obtained for the skin and brain. They have been tested using clinical and experimental material. The results of the testing point to the absence of time dependence in irradiation courses of up to 6 weeks' duration. Correlation with an irradiation field has been obtained for the skin. Time lag blurring time dependence within a certain range of courses, and the presence of a true regeneration component dependent on the volume irradiated are considered. Proceeding from such an understanding of injury-regeneration processes it is concluded that the concept of isoeffectivity of irradiation courses is conditional. Volume-time fractionation is a promising direction in the development of radiation therapy. (9 refs.)

63900 Dose-effect relationships for induction of cell inactivation and asymmetrical chromosome exchanges in three cell lines by photons and neutrons of different energy. J.Zoetelief, G.W.Barendsen (Radiobiological Inst., TNO, Rijswijk, Netherlands).
Int. J. Radiat. Biol. (GB), vol.43, no.4, p.349-62 (April 1983).
The impairment of clonogenic capacity as well as the induction of dicentric and centric rings by different types of radiation was investigated in three lines of mammalian cells (R-1,M; RUC-2 and V-79). The experiments were performed with cells in plateau phase cultures which contain 70-80 per cent of cells in the G₀ or prolonged G₁ phase of the cell cycle. They were irradiated with ¹³⁷Cs gamma rays, 300 kV X-rays or 0.5, 4.2 or 15 MeV neutrons. The different types of cells show an appreciable variation in sensitivity to induction of both types of effect, being greatest for 0.5 MeV neutrons, intermediate for 4.2 and 15 MeV neutrons and least for photons. The dose-response relationships for both types of effect were analysed for neutrons in terms of a linear dose coefficient only, while the results for photons required analysis in terms of linear and quadratic coefficients. The effectiveness per unit of dose for cell inactivation is greater than that for induction of dicentric and centric rings by factors of about 4 to 7. However, dicentric and centric rings constitute only a fraction of the chromosome aberrations. Maximum r.b.e. values of about 12 at low doses were obtained for 0.5 MeV neutrons. (17 refs.)

63901 Demonstration of a biological effect of natural ionizing radiations. A.Conter, D.Dupouy, H.Planet (Lab. de Biologie Medicale, Univ. Paul Sabatier, Toulouse, France).
Int. J. Radiat. Biol. (GB), vol.43, no.4, p.421-32 (April 1983).
The blue-green alga, *Synechococcus lividus*, was grown under various levels of radiations. Shielding of cultures with lead resulted in a lower cell growth rate; the reduction disappeared when a normal radiation level was restored in the lead chamber. Irradiations from a thorium source at a dose-rate 14 times higher than that of natural irradiation stimulated the growth of the algae. These results are a new demonstration of a biological effect of background radiations. (16 refs.)

63902 Reciprocal translocations in ageing mice and in mice with long-term low-level ²³⁹Pu contamination. F.Pachierotti, U.Andreozzi, A.Russo, P.Metalli (Div. of Phys. & Biomedical Sci., ENA, Roma, Italy).
Int. J. Radiat. Biol. (GB), vol.43, no.4, p.445-50 (April 1983).
Single intravenous injections of 185 Bq monomeric ²³⁹Pu were given to male mice, and the frequency of primary spermatocytes with reciprocal translocations, determined 724 days after treatment, was not significantly different from that of age-matched untreated controls. These old animals showed significantly higher aberration frequencies than young adults. The data therefore show that for low initial activity and very long retention time the possible cytogenetic effects of incorporated nuclide does not change the age-related pattern of increase of spontaneous chromosome aberrations. Considerations of the main variables involved in the induction of cytogenetic effects of incorporated plutonium, based on literature data, indicate that the initial injected activity, the estimated total accumulated average organ dose, and the retention time interact in a complex way; as far as can be seen at present, the effects seem to be dependent mainly on the initial activity at short times after contamination, while the retention time appears to be predominant in the case of long-term observations. (17 refs.)

63903 The sequential irradiation of mammalian cells with X-rays and charged particles of high LET. R.P.Bird, M.Zaider, H.H.Rossi, E.J.Hall (Dept. of Radiology, Inst. of Cancer Res., Columbia Univ. Coll. of Physicians & Surgeons, New York, NY, USA), S.A.Marino, N.Rohrig.
Radiat. Res. (USA), vol.93, no.3, p.444-52 (March 1983).
Chinese hamster V79 cells, synchronized in late-S phase, were irradiated with high-LET charged particles or X-rays, or exposed sequentially to a single dose of charged particles followed by graded doses of X-rays. The charged-particle irradiations consisted of deuterons (LET, 50 keV/ μ m) or ³He ions (96 or 160 keV/ μ m). The survival data obtained following the sequential irradiations show a synergistic effect compared with exposure to the low-LET radiation. An enhancement ratio is defined in order to quantify this effect. On the basis of this concept the present data show an enhanced interaction effect as the LET of the primary dose is increased or the size of this dose is increased.

The data are also discussed in terms of a recent theoretical formulation which predicts synergism as a result of the interaction between the sublethal damage produced by the two radiations. (12 refs.)

63904 The fate of cells with chromosome aberrations after total-body irradiation and bone marrow transplantation. F.Carbonell, A.Ganser, T.M.Fliedner, R.Arnold, B.Kubanke (Dept. of Clinical Physiology & Occupational Medicine, Univ. of Ulm, Germany).
Radiat. Res. (USA), vol.93, no.3, p.453-60 (March 1983).
Cytogenetic studies were done on bone marrow cells and peripheral lymphocytes of four patients (three with acute nonlymphocytic leukaemia, one with aplastic anaemia) at various intervals up to 861 days after total-body X-irradiation (TBI) at doses between 4.5 and 10 Gy (450-1000 rad) followed by syngeneic or allogeneic bone marrow transplantation. Whereas no radiation-induced aberrations could be found in the bone marrow, apart from a transient finding in the patient with the lowest radiation dose, aberrant metaphases were seen in the peripheral lymphocytes of three patients in the range from 2.5 to 46% even at 861 days after the exposure. There were no demonstrable aberrations related to TBI in the only patient developing graft-versus-host disease. The dicentric yield as determined in the aberrant metaphases with 46 centromeres ranged between 3.4 \pm 1.3 and 4.9 \pm 0.4. In one patient it was demonstrated by BldR-labeling that after 10 Gy (1000 rad) TBI the surviving and heavily damaged lymphocytes can go into cell cycle and reach at least the third mitosis. The percentage of aberrant cells diminished by about 25% at each mitotic division. (30 refs.)

63905 Characterization of an Escherichia coli mutant (radB101) sensitive to γ and UV radiation, and methyl methanesulfonate. N.J.Sargentini, K.C.Smith (Dept. of Radiology, Stanford Univ. School of Medicine, Stanford, CA, USA).
Radiat. Res. (USA), vol.93, no.3, p.461-78 (March 1983).
After N-methyl-N'-nitro-N-nitrosoguanidine mutagenesis of Escherichia coli K-12 (xthA14), an X-ray-sensitive mutant was isolated. This sensitivity is due to a mutation, radB101, which is located at 56.5 min on the E. coli K-12 linkage map. The radB101 mutation sensitized wild type cells to γ and UV radiation, and to methyl methanesulfonate. When known DNA repair-deficient mutants were ranked for their γ -radiation sensitivity relative to their UV-radiation sensitivity, their order was (starting with the most selectively γ -radiation-sensitive strain): recB21, radB101, wild type, polA1, recF143, lexA101, recA56, uvrD3, and uvrA6. The radB mutant was normal for γ - and UV-radiation mutagenesis, it showed only a slight enhancement of γ - and UV-radiation-induced DNA degradation, and it was \sim 60% deficient in recombination ability. The radB gene is suggested to play a role in the recA gene-dependent (Type III) repair of DNA single-strand breaks after γ irradiation and in postreplication repair after UV irradiation for the following reasons: the radB strain was normal for the host-cell reactivity of γ - and UV-irradiated bacteriophage λ ; the radB mutation did not sensitize a recA strain, but did sensitize a polA strain to γ and UV radiation; the radB mutation sensitized a uvrB strain to UV radiation. (31 refs.)

63906 Irradiation of mammalian cells in the presence of diamide and low concentrations of oxygen at conventional and at ultrahigh dose rates. E.P.Clark, H.B.Michaels, E.C.Peterson, E.R.Epp (Dept. of Radiation Medicine, Massachusetts General Hospital, Boston, MA, USA).
Radiat. Res. (USA), vol.93, no.3, p.479-91 (March 1983).
The response of cultured CHO cells to ultrahigh-dose-rate radiation (\sim 10⁹ Gy/sec) has been previously studied extensively using the thin-layer cell-handling technique developed in the authors' laboratory. These experiments have recently been extended to studies with diamide, which, unlike the other sensitizers tested, acts primarily as a shoulder-modifying rather than a dose-modifying agent in hypoxic mammalian cells. The data reported indicate that diamide is active as a sensitizer at ultrahigh dose rates in a manner similar to that observed at conventional dose rates, and does modify the shape of the breaking survival curve observed with low concentrations of oxygen. (20 refs.)

63907 Radiobiological effects of ¹³¹I and ¹²⁵I on the DNA of the rat thyroid. I. Comparative study with emphasis on the postirradiation hypothyroidism occurrence. H.Abdel-Nabi (Dept. of Radiology, Ohio State Univ., Columbus, OH, USA), J.A.Ortman.
Radiat. Res. (USA), vol.93, no.3, p.525-33 (March 1983).
One of the major disadvantages of the use of ¹³¹I in the treatment of thyrotoxicosis is the development of hypothyroidism. Alternatively, ¹²⁵I has been proposed for thyrotoxicosis therapy, and was thought to be preferable to ¹³¹I because of the short range of its emitted soft electrons. Several studies have shown ¹²⁵I to be as effective as ¹³¹I in the treatment of thyrotoxicosis, and equally likely to produce hypothyroidism. This work compared the radiobiological effects of ¹³¹I and ¹²⁵I given in doses to deliver the same amount of radiation to the rat thyroid gland. These effects were studied by in vivo determination of single-strand DNA breaks by alkaline sucrose gradient sedimentation using the DABA fluorescent technique to detect the DNA. Serum T₄ and TSH concentrations and percentage T₃ uptake were determined by RIA. The incidence of hypothyroidism following ¹³¹I and ¹²⁵I therapy was found to be the same (10% in each group). The extent of DNA damage following ¹²⁵I therapy was greater than the damage induced by a larger dose of ¹³¹I. (36 refs.)

63908 Quantitative changes in the arterial blood gases of mice following localized irradiation of the lungs. D.W.Siemann (Experimental Therapeutics Div., Univ. of Rochester Cancer Center, Rochester, NY, USA), R.P.Hill.
Radiat. Res. (USA), vol.93, no.3, p.560-6 (March 1983).
The arterial pH and partial pressures of oxygen (PaO₂) and carbon dioxide (PaCO₂) were evaluated in LAF 1 mice 15 and 38 weeks after localized irradiation of the animals' thoraxes. Graded radiation doses of 900 to 1200 rad were administered. These doses resulted in 0 to 100% lethality by 26 weeks (180 days) after irradiation. At 15 weeks after treatment mice receiving radiation doses which would subsequently result in lethality (by 180 days) exhibited significant reductions in their PaO₂ and elevations in their PaCO₂ values, respectively. However, there was no clear dose-response relationship between blood gas values and radiation dose, which may reflect the animals' ability to compensate for their poor blood gas exchange by an increased breathing frequency. At 38 weeks after irradiation the blood gas values were abnormal in mice from groups which had normal blood gas values at Week 15 (and no fatalities by Week 26) but in which animal deaths had occurred between Weeks 26 and 38. These data therefore indicated (i) that abnormal blood gas values occurred in the mice prior to fatalities resulting from the acute radiation pneumonitis syndrome and (ii) that mice surviving the initial radiation pneumonitis phase could still succumb to progressive pulmonary toxicity which was reflected by the increasing levels of animal lethality and altered blood gas tensions at the later times. (26 refs.)

63909 Peripheral lymphocyte response to PHA and T cell population among atomic bomb survivors. M.Akiyama (Immunology Lab. Radiation Effects, Res. Found., Hiroshima, Japan), M.Yamakido, K.Kobuke, D.S.Dock, H.B.Hamilton, A.A.Awa, H.Kato.

Radiat. Res. (USA), vol.93, no.3, p.572-80 (March 1983).

The percentage of T lymphocytes of atomic bomb survivors showed no change as a function of age or exposure dose. The percentage of T cells was slightly lower in malignant-tumor patients than in the control group, but was significantly higher in the group with chromosomal aberrations than in the control group. The percentages of phytohemagglutinin (PHA)-induced transformation of peripheral lymphocytes decreased significantly with age in the rad control group and the 200+rad exposure group, particularly so in the latter. The malignant-tumor group also showed lower percentages of PHA-induced transformation of lymphocytes of the chromosomal-aberration group were significantly depressed as compared with that of the control group. (36 refs.)

63910 Comments on 'An assessment of the role of microdosimetry in radiobiology' by Dudley T. Goodhead [*Radiat. Res.* 91, 45-76 (1982)] [and reply]. H.H.Rossi, A.M.Kellerer (Dept. of Radiology, Coll. of Physicians & Surgeons, Columbia Univ., New York, NY, USA), D.T.Goodhead.

Radiat. Res. (USA), vol.93, no.3, p.613-25 (March 1983).

A review of Goodhead dealt with a perspective of the evolving role of microdosimetry in the study of radiation effects in mammalian cells. The review was confined to the site concept. In this paper Rossi and Kellerer make a number of criticisms of Goodhead's review. In reply Goodhead refutes these criticisms. (46 refs.)

63911 Measurements of the human anterior chest wall by ultrasound and estimates of chest wall thickness for use in determination of transuranic nuclides in the lung. T.J.Sumerling, S.P.Quant (Nat. Radiological Protection Board, Chilton, Didcot, England).

Radiat. Prot. Dosim. (GB), vol.3, no.4, p.203-10 (1982).

The low energy photons on which the *in vivo* detection of plutonium isotopes and americium-241 is based are severely attenuated in body tissues. To assess the activity of these radionuclides in the lungs by external measurements it is severely attenuated in body tissues. To assess the activity of these radionuclides in the lungs by external measurements it is necessary to estimate or measure the thickness of tissues overlying the lungs. It is also desirable to distinguish between muscle and adipose tissues in the chest wall because of the difference in their attenuation properties. Diagnostic ultrasound machines developed for medical use are suitable for this purpose. Ultrasonic measurements of chest wall thickness have been made at the authors' laboratory since 1978. This paper summarizes their experience of these measurements and describes their present procedure for making the measurements. The concept of 'equivalent muscle chest wall thickness' is introduced and a method for calculating the parameter is given. Both chest wall thickness and equivalent muscle chest wall thickness have been found to correlate well with Quetelet's Index (weight divided by height squared). Residual correlations with other parameters have been examined. Empirical formulae are given that can be used to predict the chest wall thickness and equivalent muscle chest wall thickness of a subject of given weight, height and age. (14 refs.)

63912 On-line analysis of the femoral artery flow velocity waveform and its application in the diagnosis of arterial disease. T.J.Fulton, W.A.P.Hamilton, J.C.Graham, V.C.Roberts (Dept. of Biomedical Engng., King's Coll. Hospital, Medical School, London, England).

J. Biomed. Eng. (GB), vol.5, no.2, p.151-6 (April 1983).

Analysis of the instantaneous peak velocity waveform obtained from the common femoral artery can be used to provide an objective assessment of arterial disease in the leg. The calculation of waveform indices pulsatility index and rise time together with principal component analysis has been found to be the ideal method by which to assess the flow data on-line. (19 refs.)

63913 Human navigation by sound. A.D.Heyes (Dept. of Psychology, Univ. of Nottingham, Nottingham, England).

Phys. Technol. (GB), vol.14, no.2, p.68-75 (March 1983).

Discusses the development of electronic travel aids for the blind, considering in particular the use of IF and US devices. Problems associated with focusing, resolution and ranging are discussed and three methods of modulation are considered—pulse modulation, pulse repetition modulation and frequency modulation. Methods used for information processing and display are also discussed. As examples, the Sonic Guide (an FM ultrasonic aid) and the Sonic Pathfinder (a prototype pulse echo ultrasonic aid) are described. (7 refs.)

63914 Comparison of electrical field plethysmography with electrical impedance plethysmography. S.K.Guha, S.Anand (Centre for Biomedical Engng., Indian Inst. of Technol., New Delhi, India).

Ann. Biomed. Eng. (USA), vol.10, no.5, p.231-9 (1982).

As a means for assessing cardiac function, electrical field plethysmography (EFP) has been shown to have some features quite different from electrical impedance plethysmography (EIP). Here the two techniques are compared by using the two systems simultaneously on a subject and also with independent

use in different electrode configurations. The results conform with the view that EIP is related primarily to volumetric changes of the aorta, whereas EFP is affected predominantly by changes in cardiac dimensions and orientation. Because of this difference, the standard time differential formula used for EIP is not applicable for the computation of cardiac output from the EFP waveforms. An alternative method of computation based on the amplitude of the EFP waveform is suggested. (9 refs.)

63915 Monitoring of movement with radio frequency transducers. K.M.Jackson (Phys. Dept., Guys Hospital Medical School, London, England).

J. Biomed. Eng. (GB), vol.5, no.2, p.117-24 (April 1983).

Two approaches to the problem of monitoring human movement using radio frequency transducers are described. A simple two dimensional solution can monitor movement restricted to one plane, whilst a three dimensional transducer (linked to a computer), can follow movement in any plane. In both cases, by measuring the magnetic field produced by a set of small coils powered with high frequency current it is possible to calculate their relative displacement. If the coils are attached to the surface of the human body they can thus be used as a monitor of human movement. (9 refs.)

63916 Pseudoisochromatic plate design—Macbeth or tungsten illumination? G.M.Chioran, J.E.Sheedy (Ohio State Univ., Coll. of Optometry, Columbus, OH, USA).

Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.3, p.204-15 (March 1983).

Three sets of pseudoisochromatic plates were evaluated by photometry and calorimetry. The luminance contrast between the figure and background was measured and compared with a contrast detection threshold. The chromaticity coordinates of the figure and background were evaluated on the basis of how closely they approached a dichromatic line of confusion. The separation of the coordinates of the figure and background are a measure of the severity of the defect for which the plate tests. The plates were evaluated under both Macbeth (C) and tungsten (A) illuminants; two sets of plates were found to be better designed for tungsten illumination. (19 refs.)

63917 Construction, specification, and mathematical description of aspheric surfaces. G.Smith, D.A.Atchison (Dept. of Optometry, Univ. of Melbourne, Parkville, Australia).

Am. J. Optom. & Physiol. Opt. (USA), vol.60, no.3, p.216-223 (March 1983).

Rotationally symmetrical aspheric surfaces of spectacle lenses are constructed as either 'zonal aspherics' or 'continuous aspherics'. Zonal aspherics consist of annular zones surrounding a central zone with each zone being nominally spherical with progressively lower surface power the farther the zone is from the surface vertex. Aspheric surfaces are often specified by the radial drop in surface power from the center to the edge of the lens (e.g., Welsh Four-drop), but for assessment purposes the surface shape must be specified more precisely. The formulas for the description of continuous aspherics can be manipulated into different forms. Mathematical descriptions are given or developed which will enable theoretical assessment of the performances of all lenses with rotationally symmetrical aspheric surfaces. (5 refs.)

63918 Clinical nuclear magnetic resonance imaging. G.M.Bydder (Royal Postgraduate Medical School, London, England).

Br. J. Hosp. Med. (GB), vol.29, no.4, p.348-56 (April 1983).

This review considers the following topics: instrumentation; general aspects of NMR imaging; normal appearances; vascular disease of the brain; white-matter disease of the brain; cerebral tumours; paediatric neurological disease: the heart; the abdomen; the retroperitoneum and pelvis; future developments. (38 refs.)

63919 Initial clinical evaluation of whole body nuclear magnetic resonance (NMR) tomograph. I.R.Young, D.R.Bailes, M.Burl, A.G.Collins, D.T.Smith (Central Res. Labs., Thorn-EMI Ltd., Hayes, England), M.J.McDonnell, J.S.Orr, L.M.Banks, G.M.Bydder, R.H.Greenspan, R.E.Steiner.

J. Comput. Assisted Tomogr. (USA), vol.6, no.1, p.1-18 (Feb. 1982).

[received: April 1983]

A nuclear magnetic resonance (NMR) imaging system is described, and preliminary results from its clinical use are presented. The properties and detection of the magnetisation due to hydrogen protons are outlined, and a rotating frame is introduced to describe the motion of the magnetisation. Radiofrequency (RF) pulses are used to rotate the magnetisation, and slice selection is achieved using a 90° RF pulse and a magnetic field gradient. Data acquisition and image reconstruction are explained. Three scanning sequences are described: repeated free induction decay (FID), inversion-recovery, and spin-echo. These sequences produce images whose pixel values have different dependencies on hydrogen proton density, T_1 and T_2 . Inversion-recovery images shows striking differentiation between grey and white matter in the brain. The absence of bone artifact is a significant advantage over X-ray computed tomography in the posterior fossa where rapid repeated FID sequences can also be used to demonstrate flow effects. The considerable soft tissue contrast available with NMR is of value in demonstrating disease within the liver where T_1 appears to be a sensitive but relatively nonspecific diagnostic parameter. High resolution scans are of value in demonstrating the adrenal gland and spinal cord. (7 refs.)

63920 Combined flow cytometry and image cytometry of the same cytological sample. H.J.Tanke, A.M.J.Van Driel-Kulker, C.J.Cornelisse, J.S.Ploem (Dept. of Histochem. & Cytochem., Univ. of Leiden, Leiden, Netherlands).

J. Microsc. (GB), vol.130, pt.1, p.11-22 (April 1983).

Flow cytometry and image cytometry, two measuring techniques in the field of analytical cytology, can be used sequentially on the same cytological sample. Cells stained with a fluorochrome for the determination of, for example, DNA or RNA content are first analysed in suspension by flow cytometry. The results of the fluorescence analysis of the individual cells are presented after data processing as frequency histograms of the DNA or RNA content of all the cells of the sample. In these histograms certain cell populations such as those with an increased DNA content are defined and these are then selected for further investigation. This is achieved by sorting cells of interest into centrifugation buckets by means of electrostatic deflection of the droplets containing such cells. Sorted cell populations are then centrifuged on to glass slides and stained according to the acriflavine Feulgen-SITS staining procedure, a quantitative method for DNA and protein. Image cytometry of these stained cells is performed with a computer controlled television based image analysis system (LEYTAS). With this system abnormal cells with elevated DNA content or increased chromatin contrast are automatically detected, thereby eliminating almost all artefacts and normal cells. Subsequently detected objects are stored in grey-value memories after the automated analysis for visual examination by the cytologist. The possibilities of combined flow cytometry and image cytometry are illustrated in typical examples in the field of cervical, bladder and mammary cytology. (15 refs.)

63921 The possibilities offered by infrathermogrammetry for the diagnosis of the Raynaud phenomenon of vibrational origin. T.Kakosy, M.Orosz, J.Boczan.

Meres & Autom. (Hungary), vol.31, no.2, p.76-9 (1983). In Hungarian.

The authors have carried out an infrathermogrammetric examination of the hands on several healthy individuals, on people working under hand-arm vibration conditions and on others, suffering from Raynaud syndrome of non-vibrational origin, before and after cold-provocation. Five types of the infrathermogrammetric picture of the hands can be separated. The article describes characteristic features of these types and their diagnostic value. Application is recommended for aptitude tests of workers under vibrational effect, before employment and for periodic medical examinations. (6 refs.)

63922 Equipment for the clinical application of local microwave hyperthermia. B.M.Southcott (Dept. of Radiotherapy & Surgery, Charing Cross Hospital, London, England), P.B.Dunscombe, K.Gammampila, A.J.Stacey. *Med. Phys. (USA)*, vol.10, no.2, p.224-7 (March-April 1983).

The desirable features of equipment intended for the clinical application of local microwave hyperthermia are identified and the design of a machine incorporating these features is described. An assessment of the technical aspects of the performance of the equipment is given. (12 refs.)

63923 Microfluorometer for medical studies. G.V.Papayan, I.Ya.Barskii, V.V.Titov, S.S.Safinulina, V.V.Shchedrunov, O.E.Lebedev, Yu.A.Grukhin, V.V.Gushch.

Sov. J. Opt. Technol. (USA), vol.49, no.7, p.438-40 (July 1982). Translation of: *Opt.-Mekh. Prom.-st. (USSR)*, vol.49, no.7, p.34-6 (July 1982). [received: April 1983]

A microfluorometer is described that is intended for the simultaneous recording of two bands of the natural luminescence of biological specimens. The instrument is used to measure the luminescence intensity of biopsy specimens during endoscopic examination of patients as well as surgically removed material. The obtained results have shown promise for using the instrument in clinics to diagnose tumoral diseases. (3 refs.)

63924 CO₂ laser scalpel. K.Atsumi (Univ. of Tokyo, Tokyo, Japan), M.Nakajima, A.Ihara, K.Yoshida, K.Ono, J.Hiramoto, K.Sunago, S.Take-naka.

Sumitomo Electr. Tech. Rev. (Japan), no.22, p.260-3 (Jan. 1983).

Reports on the development of a CO₂ laser scalpel that has the following improved features: (1) easy-to-handle waveguide and control console; (2) suitable for a wide range of operations; and (3) highly safe system. In order to achieve these features, an improved waveguide, a handpiece with interchangeable tips, and a control console were developed. (3 refs.)

63925 Two-dimensional reconstructions from one-dimensional data by maximum entropy. S.Sibisi (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).

Topical Meeting on Signal Recovery and Synthesis with Incomplete Information and Partial Constraints, Incline Village, NV, USA, 12-14 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.FA11/1-4

The maximum entropy method (MEM) is a powerful information-theoretic approach to the inversion of many types of data in science and engineering. It has been used for reconstructing positive images in such areas as radio astronomy, medical tomography, plasma diagnostics and crystallography. Practical data are always corrupted by noise and are usually incomplete: for example, there may be missing projections or missing Fourier components. Also the instrumental response function may be incompletely known. These factors can lead to severely ill-posed inversion problems. The author applies the method here to Fourier transform nuclear magnetic resonance. (10 refs.)

63926 The implementation of a radiotherapeutic plan for patients with oral tumours in the moving field irradiation regimen. M.A.Kalinichenko, T.V.Khazova.

Med. Radiol. (USSR), vol.28, no.3, p.19-21 (March 1983). In Russian.

The authors propose an original means of the control of marking out and alignment for the implementation of a radiotherapeutic plan in the moving field irradiation regimen for patients with oral tumours. The purpose of the method is to get a cross-sectional tomogram of the zone under study and a one-time representation of the fluctuation center on it in accordance with the radiotherapeutic plan and marking out. To realize this goal a metal needle was used fixed on the tube of the tomograph X-ray tube in the plane that goes through the tube focus and pivotal axis round a patient. (6 refs.)

63927 The formation of dose distributions in combined radiotherapy of patients with endometrial carcinoma. R.E.Khachatryan, A.A.Gabelov, S.M.Vatnitskii.

Med. Radiol. (USSR), vol.28, no.3, p.22-5 (March 1983). In Russian.

The authors consider some features of the dose distribution of fields of a complex shape in γ -beam irradiation using γ -therapeutic units and electron linear accelerators in the complex of combined radiotherapy of patients with endometrial carcinoma. The authors have performed a comparative analysis of calculated and experimental results characterizing dose fields in the utilization of individually selected forming matrices and standard splitting units. It has been shown that the utilization of the forming matrices makes it possible to optimize γ -beam irradiation with a necessary screening of a primary tumour focus and a preset level of dose exposure in the pelvic lateral parts of zones of regional metastases. Spatial dose distribution with the help of matrices gives an opportunity to use intense intracavitary irradiation with high energy sources using an Agat-B unit. (5 refs.)

63928 Computerized program of the calculation of dose distribution formed with γ -radiation intracavity linear sources. V.F.Minenko, A.I.Golubovsky, I.G.Tarutin.

Med. Radiol. (USSR), vol.28, no.3, p.43-6 (March 1983). In Russian.

One can achieve a high precision in the dosing of a session of intracavity radiotherapy by rapid computation of the treatment time necessary for obtaining a certain dose in a pathological focus, taking account of the location of radiation sources in the irradiation. The authors have developed an algorithm and drawn up a program for the computer ES-1022 to calculate a dose rate in any point of an irradiated volume from the system of γ -radiation sources oriented arbitrarily in space. As part of a hard- and soft ware dosimetric complex, the program calculates the treatment time by a set dose. The program makes it possible to calculate the dose distribution in any present plane (up to 4 planes at a time) of an irradiated volume. (8 refs.)

63929 Evaluation of the efficacy of radiation therapy by means of a rated standard dose (RSD) under various conditions of irradiation. V.F.Minenko. *Med. Radiol. (USSR)*, vol.28, no.3, p.57-9 (March 1983). In Russian.

In the evaluation of efficacy or while comparing various irradiation schemes with the help of the RSD concept one should consider the effect of various conditions of the patient's irradiation (energy, a field size, dose rate, etc.) on the biological efficacy of adsorbed energy. The radiobiological effect of various irradiation schemes should be evaluated by a common scale; therefore factors altering dose biological efficacy should be considered within the limits of the same RSD formula. The incorporation in the RSD formula of an empirical expression of RBE dependence on the dose rate within the range of 0.13-300 Gh/hr. and factors of the dependence of dose biological efficacy on its spatial distribution (energy, a field size) allows one not only to consider more correctly changes in the dose for the patient's irradiation from session to session but also makes it possibly to apply it to fractionated and protracted irradiation schemes. (10 refs.)

63930 The choice of geometric parameters in the optimization of irradiation of cancer patients. A.G.Strakh, I.G.Tarutin.

Med. Radiol. (USSR), vol.28, no.3, p.59-62 (March 1983). In Russian.

The authors have devised an algorithm and made a program of 2-stage optimization of irradiation conditions. First the geometric parameters of irradiation are selected (field sizes, their number, a tangential shift of the field axis) proceeding from the peculiarities of the position of tumors, vital organs and tissues in space in respect to a source for each irradiation direction. Dose optimization is done in the 2nd stage. Doses are calculated on the basis of empirical expressions for the distribution of a dose of single γ - and inhibition radiation beams up to 42 MeV. Tissue inhomogeneity and surface curvature are taken into consideration by means of corrections. (6 refs.)

63931 The utilization of computer in the planning of radiotherapeutic volume for patients with oral tumors. T.V.Khazova, A.I.Strashinin, E.S.Dianina, E.A.Kuznetsov.

Med. Radiol. (USSR), vol.28, no.3, p.62-6 (March 1983). In Russian.

A series of dose maps have been obtained on the basis of typical isodose maps for moving irradiation of patients with oral tumors, the doses being selected with the help of a specialized computer and dose calculation program for computer ES 1020: in the main cross-sectional plane going through a tumor and in parallel planes 1 cm above and below from the main plane within the limits of an irradiation field +1 cm, dose fields have been formed in the sagittal (parasagittal) plane extending through the center of a tumor. (3 refs.)

63932 The utilization of time-dose-fractionation models in the planning of tumor radiotherapy. A.S.Pavlov, K.N.Kostromina, V.S.Datsenko, M.A.Fadeeva, A.L.Bocharov.

Med. Radiol. (USSR), vol.28, no.3, p.80-3 (March 1983). In Russian.

New methods of the fractionation of preoperative γ -beam therapy for breast carcinoma and intracavity irradiation of cervical cancer patients with ²⁵²Cf fast neutron sources have been devised and tested on the basis of the cumulative radiation effect and the system of time-dose-fractionation factors. In the selection of regimens for the intracavity irradiation fractionation, one should take into account the relative biological effectiveness of the type of radiation equal to 5 by the criterion of a direct response of a tumor within the 20-30 s γ -Cf relative biological effectiveness. Taking account of the short half-life of ²⁵²Cf source, fractionation schemes should be corrected from the view-point of the system of TDF factors not less than once in 2-3 mos. (11 refs.)

63933 Prevention of radiation injuries during multifractionation in radiation therapy. K.I.Zholkivier, I.F.Zevrieva.

Med. Radiol. (USSR), vol.28, no.4, p.3-6 (April 1983). In Russian.

A radiobiological substantiation of a method of multifractionation and a review of the results of its clinical application are presented. The authors have developed a method to calculate a cumulative radiation effect and the TDF factor in radiation therapy with multiple dose fractionation in the form of several sessions daily. This method can be used to prevent the radiation-caused complications. (25 refs.)

63934 Simulation of the organ blood flow in computer γ -scintigraphy.

B.N.Dmitriyev, I.V.Misochko, A.P.Kolgin, S.L.Kovarskii, S.V.Andronov.

Med. Radiol. (USSR), vol.28, no.4, p.28-31 (April 1983). In Russian.

The determination of the relative blood flow in organs is sometimes of greater diagnostic importance than the estimation of respective absolute indices. A detailed analysis of indispensable mathematical calculations is presented. The authors propose an algorithm and optimum sequence of calculations of relative organ perfusion using computer. The paper can be of wide applied importance. (1 ref.)

63935 PETT VI: a positron emission tomograph utilizing cesium fluoride scintillation detectors. M.M.Ter-Pogossian, D.C.Ficke, J.T.Hood, Jr. (Edward Mallinckrodt Inst. of Radiology, Washington Univ. School of Medicine, St. Louis, MO, USA), M.Yamamoto, N.A.Mullani.

J. Comput. Assisted Tomogr. (USA), vol.6, no.1, p.125-33 (Feb. 1982). [received: April 1983]

The authors designed and built a positron emission transverse tomograph (PETT VI), designed specifically for fast dynamic studies in the human brain and for cardiac studies in experimental animals. The scintillation detectors incorporated into this device are fitted with cesium fluoride crystals, selected because their short fluorescence decay allows the use of a short coincidence resolving time with a concomitant reduction of unwanted random coincidences. PETT VI utilizes four rings of 72 detectors simultaneously yielding seven tomographic sections. The short coincidence resolving time of the system permits rapid data acquisition for attenuation corrections and clinical dynamic studies with data acquisition times of less than a minute. (13 refs.)

63936 Dynamic computed tomography through interpolation. H.C.Lee, C.H.Leung (Dept. of Electrical Engng., McGill Univ., Montreal, Quebec, Canada).

J. Comput. Assisted Tomogr. (USA), vol.6, no.1, p.134-40 (Feb. 1982). [received: April 1983]

A method is proposed to reduce the requirement on the scanning speed for dynamic computed tomography of relatively fast moving objects such as the heart. From the projections measured at different times, a set of optimal projections is computed for reconstructing the image at any specified time within a permissible interval. In the method, the corresponding characteristic features of the measured projections at the same viewing angle are matched optimally by a nonlinear transformation. The matched projections are then used in an interpolation procedure to compute the projections required at the specified time. The method has been tested with mathematical phantoms that undergo partial expansion, contraction, and translational motion. The results show that the proposed method can provide acceptable images from data collected at scanning speeds that would otherwise produce severely blurred images by conventional methods. (15 refs.)

- 63937 Technical aspects of digitization X-ray image processing, especially digital subtraction angiography.** M.Pfeiler, P.Marhoff (Siemens AG, Erlangen, Germany). *Electromedica (Germany)*, vol.51, no.1, p.20-31 (1983). Digital subtraction angiography (DSA) has opened up numerous new diagnostic possibilities and enables a considerable increase in objective and subjective image quality. The authors make some observations on the subject of image quality, with special reference to the important criterion 'signal-to-noise ratio'. (15 refs.)
- 63938 'Native' computed tomography: a new radiological approach of the herniated lumbar disk.** M.Stienon, D.Baleriaux, L.Jeanmart (Inst. Brodet, Brussels, Belgium). *J. Belge Radiol.*, vol.65, no.5, p.449-54 (1982). In French. Describes the native-CT technique (thin slices, direct enlargement) and the normal anatomy of the lumbar vertebra. The authors demonstrate the semiology of the lumbar discal hernia in CT, either lateral or on the midline. Thirteen patients were surgically treated, out of a series of 26 examinations, and all of them confirmed the CT diagnosis. The advantages of native-CT are discussed: noninvasive method, simplicity of application, and ability to demonstrate other lesions that can clinically mimic a herniated disk. These characteristics allow CT to be the first choice technique of examination when a lumbar discal hernia is suspected, the more invasive techniques being reserved for patients with negative or noncontributive CT, or when another intraluminal pathology is suspected. (15 refs.)
- 63939 Single photon emission computerized tomography: a new dimension in nuclear medicine-system characterization.** L.A.A.Mortelmans, M.J.K.De Roos, P.Suetsens (Acad. Ziekenhuis St. Rafael, Leuven, Belgium). *J. Belge Radiol.*, vol.65, no.5, p.455-63 (1982). Single photon emission computerized tomography (SPECT), as a counterpart of the CAT scan, provides new diagnostic capabilities in nuclear medicine. Using a rotating gamma camera, studies may be performed with gamma emitting tracers using the conventional dose. A computer creates sections in several planes (horizontal, frontal, sagittal, oblique) by a filtered back projection method from 64 injections. A technical description of the apparatus and the basic principles of the reconstruction method are provided. The following performance characteristics of the SPECT system are reported: resolution in the transaxial plane, sensitivity, slice thickness, attenuation correction, lesion contrast, and alignment check. Notwithstanding the poor constant resolution (15-20 mm), an enhancement in contrast resolution is obtained that results in a higher diagnostic detection rate. Stability of the axis of rotation, excellent field uniformity correction, and camera-table alignment are required for the production of artefact free images. (9 refs.)
- 63940 Functional imaging of the brain.** F.A.Jolesz (Dept. of Radiology, Harvard Medical School, Boston, MA, USA). *Med. Instrum. (USA)*, vol.17, no.1, p.59-62 (Jan.-Feb. 1983). New neurophysiological methods such as 2-deoxy-D-glucose (2DG) autoradiography have stimulated rapid changes in emission imaging with radionuclides. It has been recognized that general imaging concepts and methods can be applied to many interactions of waves, particles, or fields within the body. X-ray computed tomography, single-photon emission computerized tomography, positron emission tomography, and nuclear magnetic resonance imaging have the potential to enable one to visually observe biochemical events and physiological processes in the brain, where one's knowledge is limited and one's eagerness to understand function is the greatest. (6 refs.)
- 63941 Physical aspects of a rotational total skin electron irradiation.** E.B.Podgorsek, C.Pla, M.Pla, P.Y.Lefebvre, R.Heese (Dept. of Radiation Oncology, McGill Univ., Montreal, Quebec, Canada). *Med. Phys. (USA)*, vol.10, no.2, p.159-68 (March-April 1983). A technique for rotational total skin electron irradiation is presented in which the patient stands on a slowly rotating platform (SSD=285 cm) in a large uniform linear accelerator electron field ($E_0=3.5$ MeV). The beam is scattered by the transmission ionization chamber and by a special lead/aluminum scattering filter, and then degraded by a sheet of Lucite. A Farmer chamber is used as a patient dose monitor and a method for absolute dose calibration is presented. The field is uniform to within $\pm 5\%$ for dimensions of 180×40 cm². The surface dose for rotational therapy is equal to 45% of the maximum dose in a stationary beam. The rotating beam exhibits a dose maximum on the surface, falls to 80% at 0.5 cm and has an X-ray contamination of $\sim 4\%$. The surface dose rate is about 25 cGy/min for the rotating beam. The rotational beam percentage depth dose distributions, calculated using stationary beam information, agree well with measured data. The stationary beam exhibits a dose maximum at 4 mm in tissue, a surface dose of 93%, 80% dose at a depth of 1 cm, a practical range of 1.75 cm, and an X-ray contamination of 2.5%. The rotational total skin electron irradiation significantly reduces the patient treatment and setup time and solves the problem of beam matching, when compared to standard multiple-beam techniques. (10 refs.)
- 63942 The effects of misregistration of the projections on spatial resolution of CT scanners.** M.F.Kijewski (Dept. of Environmental Health Sci., Harvard School of Public Health, Boston, MA, USA), P.F.Judy. *Med. Phys. (USA)*, vol.10, no.2, p.169-75 (March-April 1983). Misregistration of the projections in 360° computed tomographic (CT) scanners has been found to blur the image without generating artifacts. The effects of this error were investigated by analytical methods and by reconstruction of real and simulated data. The point-spread function which results from shifting each projection by a constant distance ϵ consists of a two-dimensional impulse function surrounding a region of negative density. The locus of the impulse function is a circle for parallel-beam geometry and a sixth-order curve for fanbeam geometry. The anisotropy and position dependence of the point-spread function in fanbeam geometry have been characterized. The line-spread function due to the error in parallel-beam geometry consists of two delta functions located at $\pm \epsilon$. In fanbeam geometry, the line-spread function consists of two delta functions separated by approximately 2ϵ , with the locations of the impulses dependent on the position and orientation of the line. This error, combined with other sources of blurring, results in a system edge-response function which contains a flat region at one-half the maximum density. (26 refs.)
- 63943 The technical characteristics of matched filtering in digital subtraction angiography.** S.J.Riederer (General Electric Co. Medical Systems, Milwaukee, WI, USA), A.L.Hall, J.K.Maier, N.J.Pelc, D.R.Enzmann. *Med. Phys. (USA)*, vol.10, no.2, p.209-17 (March-April 1983). The technical characteristics of a new digital fluorographic image processing method called matched filtering are presented. This technique, a type of extensive temporal integration, takes a weighted sum of images acquired during passage of a contrast bolus through some area of interest. The weight of each image is governed by the magnitude of the contrast bolus in that image. An essential requirement of the matched filter is that its integral be zero. It is shown for equal exposure rates and typical bolus characteristics that matched filtering provides a factor of two higher signal-to-noise ratio (SNR) than conventional methods for bolus transit times of 10 s or higher. Equi-

valently, matched filtering can yield images with quality comparable to conventional digital subtraction angiography (DSA) at a factor of four less patient exposure. The SNR obtained with matched filtering is shown to be within 30% of an ideal bound. Comparisons of matched filtering to standard recursive methods and simple integration are made. Experimental canine studies are presented which compare matched filtering with conventional DSA. (16 refs.)

- 63944 A detailed experimental and theoretical comparison of the angular and energy dependencies of grid transmission.** H.Bernstein (Rancho Los Amigos Hospital, Univ. of Southern California, Downey, CA, USA), E.P.Muntz, J.Schreckendgust, D.J.Klein, K.Lee. *Med. Phys. (USA)*, vol.10, no.2, p.218-23 (March-April 1983). Grid transmission characteristics have been predicted, with good agreement demonstrated between experiment and theory. Differences between the present work and an earlier theoretical analysis have been noted. It is shown that comparison between experiment and theory can lead to a sensitive method for determining grid parameters. Generally, the derived grid parameters deviate somewhat from manufacturer supplied data. Use of the manufacturer's nominal parameters can lead to large errors in predicting grid transmission. (17 refs.)
- 63945 Transportation of short-lived positron emitters from a medical cyclotron to a remote imaging suite.** J.A.Corrêa, W.H.Buculewicz, H.W.Strauss, N.M.Alpert, G.L.Brownell, J.M.Taveras (Phys. Res. Lab., Massachusetts General Hospital, Boston, MA, USA), V.Ferrari. *Med. Phys. (USA)*, vol.10, no.2, p.228-31 (March-April 1983). This paper describes a system for the transport of compounds labeled with short-lived positron emitting isotopes from a clinical cyclotron to a remote imaging suite. The system consists of a pneumatic transport line for the sending of batch lots of radioactive material and a pressurized gas line for the continuous transmission of radioactive gases. Experimental performance of both systems has been measured and a simple model for the pressurized gas line is compared to experimental results. The radiation dosimetry and safety aspects of the systems are also discussed. (5 refs.)
- 63946 Characteristics of Mevatron 77 15-MV photon beam.** J.M.Paul, R.F.Koch, F.R.Khan, B.S.Devi (Dept. of Radiation Therapy, Northwest Community Hospital, Arlington Heights, IL, USA). *Med. Phys. (USA)*, vol.10, no.2, p.237-42 (March-April 1983). The characteristics of 15-MV photon beam of Mevatron 77 have been examined with respect to clinical parameters. Some of the characteristics of this 15-MV photon beam are different from those of similar machines used in radiotherapy. The tissue-maximum ratio values have been determined experimentally for SAD 100 cm and percentage depth dose values have been determined from tissue-maximum ratio data. It is found that the experimentally determined PDD values for SSD 80, 100, and 120 cm are within $\pm 1\%$ of the calculated data. The scatter-maximum ratio data have been calculated from the experimentally determined zero area attenuation coefficient and tissue-maximum ratio data and are presented as function of depth and radii of circular fields. The relative dose factors have been determined both for square and rectangular fields. The relative dose factor for rectangular fields depends on the two pairs of jaws differently and the maximum difference is about 1.5%. The flatness and symmetry are within the specifications set by the manufacturer. (13 refs.)
- 63947 Regional silver content of radiographic film determined by X-ray fluorescence compared with optical densitometry.** W.H.Oldendorf, M.A.Astrahan (VA Medical Center Brentwood, Los Angeles, CA, USA). *Med. Phys. (USA)*, vol.10, no.2, p.246-7 (March-April 1983). The regional silver content of radiographic film measured by X-ray fluorescence is compared to light absorption measured by a densitometer. Silver content analysis appears to permit a greater dynamic range of useful exposure levels than does light absorption densitometry. This improvement in latitude, however, is not considered great enough to warrant development of a complex system for scanning silver distribution in radiographic applications. (1 ref.)
- 63948 Feasibility of noninvasive analysis of lead in the human tibia by soft X-ray fluorescence.** L.Wielopolski, J.F.Rosen, D.N.Slatkin, D.Vartsky, K.J.Ellis, S.H.Cohn (Brookhaven Nat. Lab., Medical Res. Center, Upton, NY, USA). *Med. Phys. (USA)*, vol.10, no.2, p.248-51 (March-April 1983). A postmortem study was conducted to assess the feasibility of measuring bone lead concentrations noninvasively in vivo. Characteristic L X-rays were induced with an external source of ¹²⁵I in the superficial tibial cortex of the intact legs of six adults who had no history of occupational exposure to lead. Tibial lead concentrations in the same bones subsequently determined by flameless atomic absorption spectroscopy varied from 15 to 35 $\mu\text{g Pb/g}$ wet weight. The upper limit for the modern normal range of lead in the bone is about 25 mg Pb/g wet tissue. The linear correlation coefficient (r) between the measurements made with X-ray fluorescence and lead concentration by absorption spectroscopy was 0.90. Radiation doses of 10 mGy (1 rad) to 1 cm² of skin, with associated doses to the marrow of adjacent bone of about 0.6 mGy (60 mrad), yielded net lead fluorescence signals ranging from one to seven times the standard deviation of background. (30 refs.)
- 63949 A study of problems with inventory control of I-125 seeds.** H.L.McMurry, E.L.Chaney, M.Kirsch (Radiation Therapy Div., Univ. of North Carolina School of Medicine, Chapel Hill, NC, USA). *Med. Phys. (USA)*, vol.10, no.2, p.252-3 (March-April 1983). A stringent inventory control protocol was implemented to determine the fate of I-125 seeds used for interstitial implants. Results show where emphasis is needed to limit seed loss. (no refs.)
- 63950 Repair of the energy slit on an AECL Therac-20 accelerator.** J.Pipman, O.Carpenter (Dept. of Medical Phys., Memorial Sloan-Kettering Cancer Center, New York, NY, USA). *Med. Phys. (USA)*, vol.10, no.2, p.257-8 (March-April 1983). Instabilities in the beam symmetry of the authors' AECL Therac-20 accelerator were traced back to a minute water leak in the energy defining slit. (no refs.)
- 63951 Comments on 'Radiation leakage from electron applicator assembly on a linear accelerator' [and reply].** D.Jones (Northwest Medical Phys. Center, Seattle, WA, USA), A.J.Schneider. *Med. Phys. (USA)*, vol.10, no.2, p.259 (March-April 1983). Jones comments on a technical note by Schneider (see *ibid.*, vol.9, p.761, 1982) which identifies an important radiation leakage problem. In that note Schneider proposed a method for all but eliminating the radiation leakage. Jones says that this method did not work for him. In reply Schneider says that he was able to reduce leakage to 2-5% using this method, and that apparently the leakage is a machine specific characteristic. (no refs.)

63952 A regularized iterative algorithm for limited-angle inverse Radon transform. M. Defrise (Vrije Univ. Brussel, Brussels, Belgium), C. De Mol. *Opt. Acta (GB)*, vol.30, no.4, p.403-8 (April 1983). The tomography problem is investigated when the available projections are restricted to a limited angular domain. It is shown that a previous algorithm proposed for extrapolating the data to the missing cone in Fourier space is unstable in the presence of noise because of the ill-posedness of the problem. A regularized algorithm is proposed, which converges to stable solutions. The efficiency of both algorithms is tested by means of numerical simulations. (16 refs.)

63953 Geometric deconvolution of artifacts in limited view computed tomography. R.M. Rangayyan (Electrical Engng. Dept., Univ. of Manitoba, Winnipeg, Canada), R. Gordon.

Topical Meeting on Signal Recovery and Synthesis with Incomplete Information and Partial Constraints, Incline Village, NV, USA, 12-14 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.FA2/1-3. Limited-view image reconstruction and computed tomography suffer from a systematic geometric distortion. The authors present results of Fourier deconvolution techniques to correct the artifacts. (no refs.)

63954 Localization from projections based on detection and estimation of objects. D.J. Rossi (Schlumberger-Doll Res., Ridgefield, CT, USA), A.S. Willsky.

Topical Meeting on Signal Recovery and Synthesis with Incomplete Information and Partial Constraints, Incline Village, NV, USA, 12-14 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.FA3/1-4. An object-based probabilistic model is used in reconstructing a field from limited noisy projection measurements. The performance of maximum likelihood object location estimation is characterized. (7 refs.)

63955 Tomographic imaging with limited view angle using an expansion on a set of eigenfunctions adapted to space-limited objects. L. Garnerio (Inst. d'Optique, Univ. de Paris XI, Orsay, France), J. Brunol.

Topical Meeting on Signal Recovery and Synthesis with Incomplete Information and Partial Constraints, Incline Village, NV, USA, 12-14 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.FA4/1-4. In many radiation imaging applications, such as X-ray computerized tomography or nuclear medicine, tomographic systems have been recently developed, which image an object from an angularly restricted number of projections. It is well known that in such a case, some Fourier components are missing, and thus analytical reconstructions, such as Fourier synthesis can no longer be used. But, the algebraic methods allow one to take advantage of 'a priori' informations on the object, in order to recover the missing data. Many authors have proposed different reconstruction techniques, that combine limited projection data with a priori object information through iterative revisions in both image and transform spaces. These methods in general consume much computer time. The authors propose here a new approach of the problem, based on the fact that generally the imaged organs or objects do not fill the whole detector field. The knowledge of their boundaries allows one to find, for each class of objects of the same extent, a new set of expansion functions, which are more appropriate than a Fourier expansion. The expansion of the object distribution on this new set of functions allows the object reconstruction from projection data by a mere operation of matrix multiplication. The terms of the resulting linear system of equations are the same for each object of same extent, and so the corresponding matrix inversion has to be performed only once. (4 refs.)

63956 Linear estimation with a size constraint. M.J. Lahart (Naval Res. Lab., Washington, DC, USA).

Topical Meeting on Signal Recovery and Synthesis with Incomplete Information and Partial Constraints, Incline Village, NV, USA, 12-14 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.FA5/1-4. Correlation coefficients between spectral components of a space-limited image are calculated and used to estimate missing components. The technique is used for bandwidth extrapolation and recovery of missing views in computed tomography. (4 refs.)

63957 Bayesian approach to limited-angle CT reconstruction. K.M. Hanson (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA), G.W. Weckung.

Topical Meeting on Signal Recovery and Synthesis with Incomplete Information and Partial Constraints, Incline Village, NV, USA, 12-14 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.FA6/1-4. Artifact reduction in limited-angle CT reconstruction is demonstrated by use of the Bayesian approach, which estimates an appropriate null-space contribution to the reconstruction. (8 refs.)

63958 The use of a priori information in image reconstruction from limited data. B.P. Medoff, W.R. Brody, A. Macovski (Stanford Univ., Stanford, CA, USA).

Topical Meeting on Signal Recovery and Synthesis with Incomplete Information and Partial Constraints, Incline Village, NV, USA, 12-14 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.FA7/1-4. An operator framework for limited data image reconstruction that applies to arbitrary scanning geometries and to arbitrary patterns of missing line integral data, is introduced. This framework is not based on a frequency domain interpretation, and hence can be used when the pattern of missing data does not correspond to a missing sector in the frequency domain. The operator framework allows the reconstruction algorithm to incorporate a wide class of a priori information about both the line integral data and the underlying density. (8 refs.)

63959 Incorporation of prior constraints in tomographic reconstructions from coded images. R.G. Paxman (Optical Sci. Center, Univ. of Arizona, Tucson, AZ, USA), G.R. Gindi, H.H. Barrett.

Topical Meeting on Signal Recovery and Synthesis with Incomplete Information and Partial Constraints, Incline Village, NV, USA, 12-14 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.FA8/1-4. The iterative Jacobi method is used to reconstruct 2-dimensional functions from 1-dimensional coded image data sets. The folding of prior constraints into the iterations improves the reconstructions. (no refs.)

63960 Inverse scattering reconstructions from incomplete Fourier space data. N.H. Farhat (Moore School of Electrical Engng., Univ. of Pennsylvania, Philadelphia, PA, USA).

Topical Meeting on Signal Recovery and Synthesis with Incomplete Information and Partial Constraints, Incline Village, NV, USA, 12-14 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.FA9/1-4. Shows that 3-D tomographic inverse scattering reconstruction of a scattering object is obtainable from data lying on a curved surface, rather than within a volume, of its accessed Fourier space as would ordinarily be required. (12 refs.)

63961 Deblurring and three-dimensional reconstruction from multiple linear-tomograms. S. Kawata (Dept. of Appl. Phys., Osaka Univ., Osaka, Japan), J. Sklansky.

Topical Meeting on Signal Recovery and Synthesis with Incomplete Information and Partial Constraints, Incline Village, NV, USA, 12-14 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.FA10/1-5.

The image of the tomogram obtained by a conventional X-ray tomographic machine is degraded by the superposition of motion-blurred images of non-pivotal planes. The authors introduce a method to eliminate these blurred images from a tomogram. In this method a set of tomograms, each focused on one of a set of parallel planes, are combined to form a three-dimensional reconstruction of blur-free tomograms. This approach is equivalent to the inversion of a linear system. By a mathematical analysis of linear-motion tomography, they found that linear-motion tomography is restricted to angularly-limited frequency information. An iterative matrix inversion algorithm with the constraints of nonnegativity and finite-extent is applied to the reconstruction of the plane of interest from a set of tomograms. (9 refs.)

87.60L Preparation of radioactive materials for medical and biomedical uses

63962 An $^{18}\text{O}_2$ -target for the high yield production of ^{18}F -fluoride. R.J. Nickles, R.D. Hichwa, M.E. Daube, G.D. Hutchins, D.D. Congdon (Medical Phys. Dept., Univ. of Wisconsin, Madison, WI, USA).

Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.3, p.625-9 (March 1983). A high-pressure target for the production of ^{18}F -fluoride via $^{18}\text{O}(p, n)^{18}\text{F}$ is described. A small-volume chamber receives a standard 10 mL, glass test tube with a silvered interior. The $^{18}\text{O}_2$ target gas is admitted, irradiated, then retrieved without losses into a reservoir by cryogenic pumping. At 10-MeV proton energy, 150 mCi/ μA end-of-saturated-bombardment (EOSB) activities of ^{18}F are conveniently deposited on the inner surface of the target liner. This liner is removed and serves as the reaction flask for various syntheses needing precursor ^{18}F -fluoride. Production of the simple fluoralkane CH_3^{18}F has been chosen as the standard reaction, due to its clinical demand in the assessment of regional cerebral blood flow. (21 refs.)

63963 Measurement of activity yields for $^{12}\text{C}(\gamma, n)^{11}\text{C}$, $^{14}\text{N}(\gamma, n)^{13}\text{N}$, and $^{16}\text{O}(\gamma, n)^{15}\text{O}$ reactions as a function of electron beam energy and angle from the electron beam using thick target produced bremsstrahlung. H.V. Pittsgrud (Nuclear Medicine Lab., Univ. of Cincinnati Medical Center, Cincinnati, OH, USA).

Med. Phys. (USA), vol.10, no.2, p.147-54 (March-April 1983). The calculation of activity yields from practical photoneuclear target systems designed to produce short-lived positron emitting radionuclides for nuclear medicine purposes requires certain basic information. These include a knowledge of the photon source (bremsstrahlung energy spectrum and intensity as a function of angle from the electron beam) and the γ, n activation cross section of the secondary target element. A lack of adequate information concerning these parameters motivated the present study in which activity yields for the reactions $^{12}\text{C}(\gamma, n)^{11}\text{C}$, $^{14}\text{N}(\gamma, n)^{13}\text{N}$, and $^{16}\text{O}(\gamma, n)^{15}\text{O}$ were measured as a function of energy of and angle from the electron beam between 16 and 30 MeV and 0° and 30.5° , respectively. The data indicate highly complex relationships between the activity yield and the experimental variables. Also indicated are possible applications of the data to indicate the energy of an electron beam producing a given bremsstrahlung field in which activation measurements are made. (6 refs.)

87.60M Radiation dosimetry

63964 Dosimetric substantiation of mean fractionation during irradiation of bone metastases of breast carcinoma. T.G. Ratner, G.D. Monzul, L.A. Kulikov, V.G. Sakharovskaya.

Med. Radiol. (USSR), vol.28, no.3, p.11-14 (March 1983). In Russian. Proceeding from the drawing of maps with biologically ineffective percentage doses the authors provide a dosimetric substantiation of γ -beam irradiation of different parts of the bony skeleton. It has been shown that to choose a therapeutic plan in the utilization of a nonstandard scheme of fractionation, the calculation of the TDF factor by Orton's tables is safe and illustrative. By way of example maps are given of ineffective doses used in the irradiation of bone metastases in breast cancer patients with metastases to different parts of the skeleton. (7 refs.)

63965 Dose distributions of fast electrons with an energy of 7-24 MeV in the electromagnetic formation of a beam. R.S.Shambulov, G.V.Khavan, T.S.Saibekov, N.A.Azhigaliev, A.D.Shuinbekov. *Med. Radiol. (USSR)*, vol.28, no.3, p.14-18 (March 1983). In Russian. The formation of a wide beam is found necessary for a clinical application of a fast electron beam. An electromagnetic method of formation has been worked out, and dose distributions of fast electrons formed by this method have been compared in the tissue equivalent medium with those formed with the help of thin dispersion foils. The effect of some of the individual units of the forming device in these two methods has been assessed. The experiment was conducted on medical beta-trons B-15 and B-5M-25 manufactured in the USSR. The depth dose distributions of fast electrons along the beam central axis in the electromagnetic formation for electrons with an energy of 7-24 MeV are presented. It has been established that the beam intensity in the electromagnetic formation is higher than in the utilization of dispersion foils, and the depth dose distribution is also better. (6 refs.)

63966 Stability of optimum problem solution to determine optimum physical and technical conditions of irradiation. L.Ya.Klepper. *Med. Radiol. (USSR)*, vol.28, no.3, p.33-8 (March 1983). In Russian. The problem of the determination of optimum physical and technical plans of irradiation is often due to the problems of linear programming. To solve such a problem, it is necessary to calculate a matrix of conditions (dose rate in the system of distributed control points in the body during irradiation in different present directions). The author studies the influence of errors of the calculation of dose rates upon the optimum irradiation plans. It has been established that though the task of determining optimum plans is a correct one, convergence of the solution of a disturbed problem to an initial one occurs extremely slowly. The optimum values of the functionals of a disturbed problem converge more rapidly to the functional of an initial problem. The comparison of optimum irradiation plans or optimum and traditional irradiation plans seems difficult. To compare different irradiation plans, it is more convenient to use the values of a specific function (optimization criteria). (8 refs.)

63967 Regularities of the dose field formation in placing ^{252}Cf and ^{60}Co sources on the same plane. V.N.Ivanov, B.M.Vtyurin, L.F.Ivanova, Yu.R.Kondzharya. *Med. Radiol. (USSR)*, vol.28, no.3, p.38-42 (March 1983). In Russian. A computerized study was made of a change in the correlation between the sizes of an irradiated volume and the distribution of sources. Criteria have been established for the utilization of ^{252}Cf and ^{60}Co sources of different active length and design placed on the same plane. The reference dose rate and its derivatives have been chosen as the main parameters that characterize a dose field. A dosimetric analysis was performed using the data for an absorbed dose of neutrons in the tissue, taking account of the high RBE of ^{252}Cf fast neutrons, and a slight change of the local RBE value near the source. The irradiated volume was evaluated by introducing the 3 linear parameters of length, thickness and width. The results obtained are presented graphically. They are used for a dosimetric control of the clinical trials of ^{252}Cf and ^{60}Co sources in the treatment of patients with tumors of the tongue, oral cavity fundus, lip and other sites. (8 refs.)

63968 Dosimetric characteristics of thermoluminescent detectors for inhibitory and electron radiation of a betatron B5M-25. V.I.Popov, N.Ya.Motrii. *Med. Radiol. (USSR)*, vol.28, no.3, p.49-55 (March 1983). In Russian. The authors present the results of experimental and theoretical determinations of coefficients of the transition from thermoluminescent detector readings to an absorbed dose in water, and the correlation between the detector readings and the depth in a phantom for betatron inhibitory and electron radiations. Comparative measurements of absorbed doses have been made with a ferrous sulphate system and 2 dosimeters with ionization chambers. The measurement data have been confirmed theoretically, making it possible to use small-size autonomous glass detectors in clinical dosimetry including those for the direct measurement of irradiation dose patients receive, to control the results of the dosimetric planning of radiation therapy. Theoretical correlations obtained can be used for the prognosis of behaviour of thermoluminescent detectors in the fields of inhibitory radiation of high energies and arbitrary spectral composition as well as for electron spectra with energies up to 25 MeV. (13 refs.)

63969 Analytical description of dose fields from accelerated electrons. V.A.Kozlov, O.N.Denisenko. *Med. Radiol. (USSR)*, vol.28, no.3, p.56-7 (March 1983). In Russian. The authors present a simple expression describing dose fields in the water phantom from the betatron B5M-25 electron beam using the Fermi-Dirac distribution function. The peculiarity of these expressions is the utilization of parameters that reflect the main characteristics of a dose field—the depth distribution of 50% of the isodose and the projection of the zone of a dose decline along the beam axis and in its transverse cross section. The expressions proposed here could be also used for other electron accelerators. (4 refs.)

63970 Time dose distribution in radiation therapy planning. I.F.Zevrieva. *Med. Radiol. (USSR)*, vol.28, no.4, p.58-62 (April 1983). In Russian. Until recently the effect of a dose fractionation regimen was disregarded in radiation therapy planning. A method devised for the calculation of isodose maps made it possible to obtain iso-effective distributions where radiation exposures in different dose fractionation regimens are presented in the form of isoline in TDF units. The method of the calculation of iso-effective maps allowed one to analyse the effect of the procedure of the implementation of a radiotherapeutic plan and the conditions of dose rate fixing. The author cites by way of an example the calculation of a 3-field static irradiation of esophageal cancer with 5 fractions a week. All possible variants of the implementation of this therapeutic plan were studied. Daily irradiation of all the planned fields has been shown to be optimum. This conclusion is corroborated by the literature data. The absolute value of the TDF factor in the adjacent healthy organs and tissues increases noticeably using in the calculations isodose curves fixed to the dose in the focus depth as compared to fixing on the dose on the surface. Isoeffective maps can be successfully used for an analysis of clinical and therapeutic results. (9 refs.)

63971 Application of inhalation retention functions to in vivo measurement. M.H.Johnson (Knolls Atomic Power Lab., Schenectady, NY, USA), M.T.Ryan, K.F.Eckerman, K.W.Skrable. *Radiat. Prot. Dosim.* (GB), vol.3, no.4, p.197-201 (1982). Recent radiation protection recommendations place joint constraints on the annual dose equivalent from external irradiation and the annual intake of radionuclides. The inhalation intake of workers acutely exposed to photon emitting radionuclides can be estimated from measurements of activity burdens in the respiratory tract and the time dependence of retention derived from the respiratory clearance model. Functions describing the fraction of the inhaled material retained in the respiratory tract are derived and their application to evaluation of the radiological status of an exposed worker noted. (8 refs.)

63972 Radiation absorbed dose estimates for positron emission tomography (PET): inert gases ^{19}Ne and ^{77}Kr . K.J.Kearfoot (George Cotzias Lab. of Neuro-Oncology, Memorial Sloan-Kettering Cancer Center, New York, NY, USA).

Health Phys. (GB), vol.44, no.3, p.235-41 (March 1983). Detailed estimates of radiation absorbed dose based on solubility data and the distribution of body water and fat are presented for ^{19}Ne and ^{77}Kr , useful PET rCBF imaging agents. The steady-state inhalation of 75 mCi of ^{19}Ne and the bolus inhalation of 18 mCi of ^{77}Kr should result in comparable imaging statistics for typical protocols and lung radiation absorbed doses less than approx. 0.5 rad. A model for both steady-state and bolus inhalation techniques for soluble gases used for these radiation absorbed dose calculations is also presented. (18 refs.)

63973 Kerma transmission through steel for a p(66)Be(49) neutron beam: an update. R.K.Ten Haken, M.Awschalom, I.Rosenberg (Fermi Nat. Accelerator Lab., Batavia, IL, USA). *Health Phys.* (GB), vol.44, no.3, p.277-81 (March 1983). The measurements reported show that, in the design of a target shield for a therapeutic neutron beam source to be mounted on an isocentric gantry, considerable weight may be saved using 5 cm of polyethylene in place of 5 cm of steel, especially in the outer layers. Furthermore, for beam-off protection of medical personnel, the outer 2.5 cm of steel may be replaced with 2.5 cm of lead without significant loss of beam-on protection to the patient. (10 refs.)

63974 Dose calibrator response to brachytherapy sources: a Monte Carlo and analytic evaluation. J.F.Williamson (Dept. of Therapeutic Radiology, Univ. of Minnesota Hospitals, Minneapolis, MN, USA), R.L.Morin, F.M.Khan. *Med. Phys.* (USA), vol.10, no.2, p.135-40 (March-April 1983). It is well known that the dose calibrator response/unit exposure rate depends significantly upon source energy. However, investigation of ^{137}Cs , ^{192}Ir , and ^{226}Ra brachytherapy sources by empirical, analytical, and Monte Carlo techniques shows that source filtration significantly affects the calibrator reading to exposure rate conversion factor. The results demonstrate that for each clinically used filtration thickness an exposure calibrated standard source is required to establish the response of the well chamber. An interesting consequence of this analysis is that the Sievert point dose algorithm for clinical sources overestimates the dose on the order of 3% at distances of approximately 3.5 cm from the source. (19 refs.)

63975 The application of multiple scattering theory to therapeutic electron dosimetry. D.Jette (Dept. of Therapeutic Radiology, Rush-Presbyterian-St. Luke's Medical Center, Chicago, IL, USA), A.Pagnamenta, L.H.Lanzl, M.Rozenfeld. *Med. Phys.* (USA), vol.10, no.2, p.141-6 (March-April 1983). Fermi-Eyges multiple scattering theory for electrons is explained, and a general three-dimensional formalism is developed for its application to problems of therapeutic electron dosimetry. The formalism is illustrated by a number of elementary examples: a rectangular beam, an isotropic point source, and a scanning line source. (9 refs.)

63976 Absorbed dose determination for interstitial ^{125}I boost therapy. F.M.Waterman, K.A.Strubler (Dept. of Radiation Therapy & Nuclear Medicine, Thomas Jefferson Univ. Hospital, Philadelphia, PA, USA). *Med. Phys.* (USA), vol.10, no.2, p.155-9 (March-April 1983). Iodine-125 implants are being used to boost external beam treatments of unresectable pancreas and lung tumors. Calculations of the ^{125}I activity required to achieve a specific average peripheral dose are presented as a function of the average tumor dimension for spherical, ellipsoidal, and cylindrical implants. Both uniform and random seed spacings are investigated. The results indicate that the average peripheral dose is relatively insensitive to the seed distribution as well as to the seed activity. The average tumor dose is typically 20% greater than the average peripheral dose. (5 refs.)

63977 Some theoretical derivations relating to the tissue dosimetry of brachytherapy nuclides, with particular reference to iodine-125. R.G.Dale (Dept. of Medical Phys., Charing Cross Hospital, London, England). *Med. Phys.* (USA), vol.10, no.2, p.176-83 (March-April 1983). Using a Monte Carlo computer technique, tables of parameters have been derived which are of use in the dosimetry of brachytherapy nuclides in a variety of tissues and organs. From the results, it has been possible to derive relationships linking the composition of a tissue with the dose received at any location around an implanted source. Other factors, such as the relative importance of scattered radiation, spectral degradation, and integral dose, are also discussed. In particular, attention is drawn to possible dosimetric problems arising from the clinical use of ^{125}I . (26 refs.)

63978 Monte Carlo estimates of specific absorbed fractions for an I-125 point source in water. G.S.Burns, D.E.Raeside (Dept. of Radiological Sci., Univ. of Oklahoma Health Sci. Center, Oklahoma City, OK, USA). *Med. Phys.* (USA), vol.10, no.2, p.197-8 (March-April 1983). Monte Carlo estimates of eight specific absorbed fractions associated with an I-125 point source in water are presented for distances ranging from 1-10 cm. (6 refs.)

63979 A new approach to CT pixel-based photon dose calculations in heterogeneous media. J.W.Wong, R.M.Henkman (Dept. of Medical Biophys., Princess Margaret Hospital, Toronto, Ontario, Canada). *Med. Phys.* (USA), vol.10, no.2, p.199-208 (March-April 1983). The effects of small cavities on dose in water and the dose in a homogeneous nonunit density medium illustrate that inhomogeneities do not act independently in photon dose perturbation, and serve as two constraints which should be satisfied by approximate methods of computed tomography (CT) pixel-based dose calculations. Current methods at best satisfy only one of the two constraints and show inadequacies in some intermediate geometries. The authors have developed an approximate method that satisfies both these constraints and treats much of the synergistic effect of multiple inhomogeneities correctly. The method calculates primary and first-scatter doses by first-order ray tracing with the first-scatter contribution augmented by a component of second scatter that behaves like first scatter. Multiple-scatter dose perturbation values extracted from small cavity experiments are used in a function which approximates the small residual multiple-scatter dose. For a wide range of geometries tested, the authors' method agrees very well with measurements. The average deviation is less than 2% with a maximum of 3%. In comparison, calculations based on existing methods can have errors larger than 10%. (28 refs.)

63980 Quantitative determination of tolerance doses for preoperative and postoperative radiotherapy of bones. R.Datta (Dept. of Radiology, Louisiana State Univ. Medical Center, Shreveport, LA, USA), S.Saha. *Med. Phys.* (USA), vol.10, no.2, p.243-5 (March-April 1983). A method has been developed for the quantitative determination of the tolerance doses for preoperative and postoperative radiotherapy of bones in New Zealand white rabbits. The midshaft osteotomy was carried out on both ulnae

of each rabbit. Localized radiation of 2000, 3000, and 4000 rad (20, 30, and 40 Gy) was given in daily fractions of 500 rad to different groups of rabbits. The diaphyseal area of one forearm of each rabbit was irradiated and the other forearm was used as a control. After healing, the mechanical strength of each ulna was measured. The end point is defined as 'strength reduction dose-63' (SRD₆₃), i.e., the dose which would be expected to reduce the mechanical strength of the irradiated, fractured, and healed bone compared with the contralateral unirradiated diaphysis by 63%. The SRD₆₃s for preoperative and postoperative radiotherapy were 4350 rad (43.5 Gy) and 6200 rad (62 Gy), respectively, with a 500 rad (5 Gy)/fraction schedule. Through the use of the nominal standard dose (NSD) formula at 300 rad (3 Gy)/fraction and five fraction per week, these SRD₆₃s are equivalent to 5700 rad (57 Gy) and 8100 rad (81 Gy), respectively. (4 refs.)

63981 Surface doses for acrylic versus lead acrylic blocking trays for Co-60, 8-MV, and 17-MV photons. F.J.Bova, L.W.Hill (Div. of Radiation Therapy, Coll. of Medicine, Univ. of Florida, Gainesville, FL, USA). *Med. Phys. (USA)*, vol.10, no.2, p.254-6 (March-April 1983). Clear acrylic trays are commonly used on teletherapy units to support free-hand and custom-molded blocks for photon beam irradiation. While these trays have many desirable physical characteristics, they have the disadvantage of degrading the buildup region by contribution of low-energy electrons to the patient's surface. Recently, clear leaded acrylic has been introduced and suggested as a replacement for acrylic. The effect of the lead acrylic on the buildup region was investigated for cobalt-60, 8-MV, and 17-MV X-ray beams. The lead acrylic was found to decrease the surface dose compared to acrylic. Except for cobalt-60, the lead acrylic results in a higher dose than an open wire tray. (11 refs.)

63982 Calculation of low-energy neutron dose indices and depth doses in the ICRU tissue sphere. Y.-L.Shue, A.B.Chilton (Nuclear Engng. Program, Univ. of Illinois, Urbana, IL, USA). *Radiat. Res. (USA)*, vol.93, no.3, p.421-43 (March 1983). Detailed neutron dose distributions were calculated for the ICRU tissue sphere for broad, parallel beams of incident neutrons with 10 different energies ranging from thermal to 0.3 MeV. The calculation was carried out by the Monte Carlo method on the CYBER 175 computer of the University of Illinois. From these calculated data, a set of fluence-to-dose-index conversion factors, needed to establish the allowable limits for exposure to external neutron beams, was obtained. Normalized depth doses along the principal axis at depths of 0.007, 0.3, and 1.0 cm are also provided. The fluence-to-dose-index conversion factors are compared to previous conversion factors based on cylindrical phantoms, and any differences are explained. (21 refs.)

63983 Scientific and administrative bases of radiological protection. H.J.Dunster (Nat. Radiological Protection Board, Chilton, England). *Radiol. Prot. Bull. (GB)*, no.51, p.15-21 (March 1983).

Considers the question of how should, collectively, the proper level of exposure of a worker to ionising radiation be chosen. The author identifies how the scientific and social aspects of this question inter-relate, points out some of the more difficult issues and indicates a possible way forward. He considers the situation as it is today, with existing knowledge, existing problems and existing attitudes. (no refs.)

63984 Classification of radionuclides. K.B.Shaw (Nat. Radiological Protection Board, Chilton, England). *Radiol. Prot. Bull. (GB)*, no.51, p.22-3 (March 1983). Considers the classification scheme given in Annex 1 of the Euratom Directive of 15.7.80 (Off. J. Eur. Comm., no.L246/1). This classification is based on a scale of potential harmfulness. Another classification scheme, developed initially to provide numerical quantities for use in the designation of areas and in establishing quantities appropriate to the notification of incidents, is also considered (K.B. Shaw and S.A. Beach, NRPB report, to be published). (4 refs.)

63985 ¹³⁷Cs content of deer: Savannah River Plant vs. South Carolina Coastal Plain herds. J.R.Watts, E.W.Rabon, A.S.Dicks (Savannah River Lab., E.I. du Pont de Nemours & Co., Aiken, SC, USA).

Health Phys. (GB), vol.44, no.3, p.272-4 (March 1983). The ¹³⁷Cs distribution of deer of both Savannah River Plant and the South Carolina Coastal Plain (SCCP) are qualitatively described by a log normal distribution. For the five years 1975-9 the SCCP means are higher at the 0.005 significance level for three years and at the 0.05 significance level for two years. It is postulated that the sterile, moist, sandy soils of the SCCP in combination with high water tables and some specific radionuclide-concentrating plants were the major factors resulting in high fall-winter accumulation of ¹³⁷Cs in meat of SCCP deer. (15 refs.)

63986 Characterization of the oscillographic method for measuring indirect blood pressure. L.A.Geddes, M.Voelz, C.Combs, D.Reiner, C.F.Babbs (Biomedical Engng. Center, Purdue Univ., West Lafayette, IN, USA). *Ann. Biomed. Eng. (USA)*, vol.10, no.6, p.271-80 (1982).

In this study, human subjects and dogs were used to determine the ability of the oscillographic method to indicate systolic and diastolic pressure. In the human studies, the auscultatory method was used as the reference. In the animal studies, directly recorded blood pressure was used as the reference. The ability of the sudden increase in cuff pressure oscillations during cuff deflation to indicate systolic pressure was examined and found to overestimate systolic pressure slightly in man, but more in animals. Systolic pressure was encountered when the cuff pressure oscillations were about one half of their maximum amplitude. However, in both man and animals the ratio was not constant; although the range was less in man than in animals. Diastolic pressure was encountered when cuff-pressure oscillation amplitude was about 0.8 of the maximal amplitude. This ratio for diastolic pressure was not constant over a range of diastolic pressure. The range of variability was less for man than for the dog. (13 refs.)

63987 The human tibia: static testing in bending by an in vivo method. I.D.Stein (US Veterans Administration Medical Center, East Orange, NJ, USA), G.Granik. *Ann. Biomed. Eng. (USA)*, vol.10, no.6, p.281-94 (1982).

Describes a method for static testing of the human tibia in bending in the living subject. A prototype device for carrying out the test has been fabricated. Model testing indicating that the device and model system are inherently accurate and reliable. However, the biological system is more complex, and while more than 200 tests have been conducted with perfect safety. The variability of replicate tests suggests that the method does not yet have general clinical utility. In some subjects, that variance is relatively small, possibly because they are more relaxed and perhaps also for anatomical reasons. In two subjects, postmortem tests correspond very well with antemortem tests on the tibiometer. It is concluded that with further refinements the method may have clinical potential, if only in carefully selected subjects. (11 refs.)

63988 A comparison of methods for measuring event-related potentials. E.Callaway, R.Halliday, R.I.Herning (Langley Porter Psychiatric Inst., Univ. of California, San Francisco, CA, USA).

Electroencephalogr. & Clin. Neurophysiol. (Netherlands), vol.55, no.2, p.227-32 (Feb. 1983).

Visual event-related potentials (ERPs) were recorded from 21 hyperactive children under 2 attention conditions (passive and active) and 4 doses of stimulant drug (methylphenidate). This data base was used to evaluate several methods of ERP component measurement. These methods were (1) conventional visual peak and trough selection; (2) automatic feature extraction based on peaks; (3) automatic feature extraction based on segments; (4) gross amplitude measures; (5) principal components analysis on normalized data and latency-adjusted data. No one method emerged as the best overall. Rather it is the case that different methods are best suited to different purposes, and criteria for choosing methods are outlined. (6 refs.)

63989 Laser etched bifilar fine wire electrode for skeletal muscle motor unit recording. R.M.Nelson (Dept. HHS, Nat. Inst. for Occupational Safety & Health, Morgantown, VA, USA), G.L.Soderberg. *Electroencephalogr. & Clin. Neurophysiol. (Netherlands)*, vol.55, no.2, p.238-9 (Feb. 1983).

To selectively record a limited number of skeletal muscle motor unit action potentials, a bifilar fine wire electrode was developed. Two 8 μ m fine wires were braided together, a hook formed, and ends insulated. A round beam pulsed laser etched a 5 μ m piece of insulation from each wire near the hooked end. Bipolar recordings from a select number of skeletal muscle motor units were obtained from these two uninsulated 5 μ m areas. Reactive and capacitative components for each set of electrodes were measured. These electrodes were selective in recording from 3 to 5 single motor unit action potentials at low isometric tension levels. (4 refs.)

63990 Nonlinear fluid systems identified by random noise input. E.Delavault, G.Saumont, R.Georges (Inst. Nat. de la Sante et de la Recherche Medicale, Hopital Xavier Bichat, Paris, France). *J. Appl. Physiol. (USA)*, vol.53, no.6, p.1643-9 (Dec. 1982). [received: April 1983]

The usual impedance measurement by Fourier analysis leads to undetectable errors when applied to nonlinear fluid systems where a nonlinear pressure drop $p=K.v^2$ adds to the linear pressure-flow relationship, but processing series of impedance data with various input levels allows the measurement of such systems. This new method has been tested on simulations, nonlinear resistances, and intubation tubings. It gives accurate estimates of the nonlinear coefficient K together with the true linear impedance of the measured system. This way, the usual respiratory impedance measurement may be applied to intubated patients, as the respiratory impedance of the subject can be separated from the linear behavior of the endotracheal tube or cannula. (23 refs.)

- 63991 A new method for measurement of respiratory resistance.** C.F.Shaw, S.T.Chiang, Y.C.Hsieh, J.Milic-Emili, C.Lenfant (Dept. of Physiology, Nat. Yang-Ming Medical Coll., Taipei, Taiwan). *J. Appl. Physiol. (USA)*, vol.54, no.2, p.594-7 (Feb. 1983).
A new method for measuring the resistance of the total respiratory system is presented. The method uses a device comprising a solenoid valve, a multiperforated plate, and a pneumotachograph. The multiperforated plate serves as a constant resistor (R_k) that is used to partially occlude the airway opening, thus rapidly and briefly reducing airflow during natural expiration. If it is assumed that the driving pressure remains constant during the very short period the airway is partially occluded, the respiratory flow immediately preceding the addition of R_k (V) and the flow reduction during partial occlusion (ΔV) allow calculation of the resistance of the total respiratory system. The resistance of 14 normal subjects and 18 patients with chronic obstructive pulmonary disease (COPD) was measured with this new method as well as with the body plethysmographic method: 90% of the interrupter values fell within ± 0.6 cm $H_2O \cdot l^{-1} \cdot s$ of the plethysmographic values, and all fell within ± 0.8 cm $H_2O \cdot l^{-1} \cdot s$. (11 refs.)
- 63992 Time series methods in the monitoring of intracranial pressure. II. Comparative study and initial assessment.** R.Allen (Dept. of Anaesthesia, Univ. of Leeds, Leeds, England). *J. Biomed. Eng. (GB)*, vol.5, no.2, p.103-9 (April 1983).
For pt.I see *ibid.*, vol.5, no.1, p.5-18, 1983. The primary objective of monitoring intracranial pressure (ICP) is to detect a reduction in brain compliance at an early stage in order to be able to initiate corrective therapy and thus ensure that an adequate cerebral perfusion is maintained. This paper describes studies aimed at assessing the value of several time series analysis techniques as a basis for a scheme of monitoring ICP. The theoretical foundations for this work were laid in pt.I. The paper begins with the outline of a suite of computer programs that were written to implement the techniques selected. Early results from studies with the programs are presented and the discussion is directed towards explaining practical aspects and limitations of the methods that were experienced. It is concluded that the most promising avenue for future development is the use of a dynamic linear model with a recursive parameter estimator within an adaptive framework. The direction of this future work is presented. (19 refs.)
- 63993 Static response of a simple piezoelectric load cell [biomechanical applications].** M.Lord, D.M.Smith (Bioengng. Centre, Univ. Coll. London, London, England). *J. Biomed. Eng. (GB)*, vol.5, no.2, p.162-4 (April 1983).
The design of a simple load cell is presented. The cell is based on piezoelectric methods employing charge amplification, and such a system inevitably results in DC drift. The optimization of the drift characteristics to yield quasistatic operation is discussed. (1 ref.)
- 63994 Complications of and improvements to breathing circuit monitors for anaesthesia ventilators.** J.A.McEwen, L.C.Jenkins (Vancouver General Hospital, Vancouver, Canada). *Med. Instrum. (USA)*, vol.17, no.1, p.70-4 (Jan.-Feb. 1983).
Despite significant improvements in the safety of anesthetic equipment in recent years, disconnection in the patient breathing circuit remains one of the most common types of preventable anesthetic mishaps. Many currently available breathing-circuit monitors cannot reliably detect several hazardous conditions in the breathing circuit. An improved breathing circuit monitor has been developed that reliably detects realistic simulations of many hazardous conditions. The software algorithm in this monitor stores the normal pressure waveform in the patient circuit, evaluates the ongoing waveform in terms of sets of absolute and relative criteria, and warns the operator when such criteria are not satisfied. A comprehensive technical and clinical evaluation is underway. (9 refs.)
- 63995 A device to quantify passive resistance to motion of the leg.** G.F.Harris, S.J.Larson, A.Sances,Jr., D.C.Hemmy (Medical Coll. of Wisconsin, Milwaukee, WI, USA), E.A.Millar. *Med. Instrum. (USA)*, vol.17, no.1, p.75-8 (Jan.-Feb. 1983).
A device has been developed to quantify passive resistance to motion of the leg in both ambulatory and nonambulatory subjects. This device was used to monitor the progress of 11 children with cerebral palsy, who received chronic cerebellar implants for the relief of hypertonus. (13 refs.)

- 63996 Functional stimulation—instrumentation and clinical relevance.** T.M.Srinivasan, K.Srinivasa Rao (Biomedical Engng. Div., Indian Inst. of Technol., Madras, India). *CSIO Commun. (India)*, vol.9, no.1, p.22-9 (Jan.-March 1982). [received: March 1983]
Functional electrical stimulation (FES) is accepted as a proven method of rehabilitation in various conditions of central and peripheral nervous system defects. Thus stimulation of cerebral and cerebellar cortex for prosthetic and postural rehabilitation, stimulation of cardiac muscles, phrenic nerve, spinal motor pool for bladder control, drop foot and related conditions etc. have become a clinical reality. The author deals with an electric peroneal brace used for correction of drop foot and clinical evaluation procedures for assessing the parameters and improvements in gait. This corrective method enables long term rehabilitation due to the apparent ability of central neurons to relearn this lost function. (11 refs.)
- 63997 A pressure curve monitor for intratracheal jet ventilation.** G.A.Baer, J.A.Malmivuo, P.P.Talonen (Electronics Lab., Tampere Univ. of Technology, Tampere, Finland). *J. Biomed. Eng. (GB)*, vol.5, no.2, p.134-6 (April 1983).
Most of the complications during intratracheal jet ventilation for laryngomicroscopy are due to the unnoticed wearing off of laryngeal muscle relaxation. Recovering laryngeal muscle function will, by slightly narrowing the size of the glottis, influence the slope of the quickly rising part of the pressure curve, when influences on maximum airway pressure are still not detectable. An electronic device incorporating the window comparator technique monitors the pressure curve and sets off an alarm before changes in maximum airway pressure or recovery of muscle strength in the forearm are detectable. The pressure curve monitor could be useful also with intratracheal jet ventilation for treating adult respiratory deficiency and with conventional ventilators during anaesthesia to detect the wearing off of muscle relaxation. (9 refs.)
- 63998 A battery powered constant current stimulator.** K.M.Jackson, H.T.Denyer (Dept. of Phys., Guy's Hospital Medical School, London, England). *J. Biomed. Eng. (GB)*, vol.5, no.2, p.165-6 (April 1983).
A versatile portable, constant current stimulator is described. The low active component count (2 CMOS integrated circuits, 5 transistors), and internal batteries make it a low cost safe design. Inadvertent false operations are detected by an LED which illuminates when the desired stimulus current has not been delivered. (no refs.)
- 63999 Effect of defibrillation energy on pacing threshold.** L.Rubin (Tuxedo Memorial Hospital, New York, NY, USA), P.Hudson, J.Driller, L.Dick, A.Villanueva. *Med. Instrum. (USA)*, vol.17, no.1, p.15-17 (Jan.-Feb. 1983).
After an episode of electrical defibrillation, periods of increased pacing threshold may cause lack of pacing in pacemaker patients. This effect is independent of the energy applied during defibrillation, although the data suggest that the most rapid return to predefibrillation pacing thresholds occurs after minimal energy countershocks. (7 refs.)
- 64000 Effects of myocardial infarction on catheter defibrillation threshold.** C.F.Babbs, R.L.Paris, W.A.Tacker,Jr., J.D.Bourland (Biomedical Engng. Center, Purdue Univ., West Lafayette, IN, USA). *Med. Instrum. (USA)*, vol.17, no.1, p.18-20 (Jan.-Feb. 1983).
Changes in ventricular defibrillation threshold following coronary occlusion were determined, using an electrode catheter designed for use with an automatic implantable defibrillator. Acute myocardial ischemia was produced without thoracotomy in 10 dogs (experimental group) by embolization with a plastic bead injected via a catheter into the left coronary artery. A control group of 4 dogs had only saline injected into the artery. Defibrillation threshold was measured at 15-min intervals from 1 hour before embolization to 2 hours after embolization. In the control group, voltage, current, energy, and impedance were unchanged after injection of saline into the coronary artery, and india ink perfusion revealed no ischemic areas. In the experimental group postembolization threshold current and energy were significantly higher than pre-embolization values: 0.47 vs. 0.40 A/kg and 1.01 vs. 0.80 J/kg, respectively ($p < 0.01$). The magnitude of the peak change in threshold current after embolization was positively correlated ($r = 0.79$) with the size of the ischemic zone, determined by weighing unstained areas after india ink perfusion. Defibrillation threshold for a catheter electrode configuration increased for at least 2 hours following onset of acute myocardial ischemia. This finding must be

- accounted for in the design and use of an automatic implantable defibrillator. (8 refs.)

87.70J Prosthetics and other practical applications

- 64001 A comparative study of tear evaporation rates and water content of soft contact lenses. T.H.Cedarstaff, A.Tomlinson (Indiana Univ., School of Optometry, Bloomington, IN, USA). *Am. J. Optom. & Physiol. Opt. (USA)*, vol.60, no.3, p.167-74 (March 1983). Tear evaporation rates were measured by resistance hygrometry in a group of five subjects wearing soft contact lenses ranging in initial water content from 38 to 70%. The water content of the lenses before and after wear was measured by a 'wet blot weighing' technique using a chemical balance. The placing of all types of soft lenses on the eye disrupts the tear film sufficiently to produce significant increases in evaporation. This increase in tear evaporation was not found to be related to the initial water content of the soft lens. Water lost by dehydration of the lens material made a relatively minor contribution to the increase in evaporation from the eye during lens wear. (14 refs.)
- 64002 Studies on the stress behaviour in the bone/cement interface in total hip replacement. D.Gebauer, W.Winter, H.Hager (Inst. für Sporttraumatologie, Tech. Univ. München, München, Germany). *Biomed. Tech. (Germany)*, vol.28, no.4, p.79-83 (April 1983). In German. Numerous studies on the problem of aseptic loosening in total hip replacement reveal the importance of biomechanical overloading in the interface between bone and cement. Since there are no measured data on the stresses present in the interface, the authors attempted to obtain initial information on the stress situation in the cup and the interface by means of a two-dimensional simulation model. The experiments showed that the interface is loaded by relatively high traction and shearing stresses which can be explained by the deformation of the bone-simulation model. These stresses might play a significant part in the cup-loosening process, quite apart from the shearing stresses induced by joint friction. (2 refs.)
- 64003 Adaptive microcomputer control of an artificial knee in level walking. A.Bar, G.Ishai, P.Meretsky, Y.Koren (Julius Silver Inst. for Biomedical Engng., Technion, Haifa, Israel). *J. Biomed. Eng. (GB)*, vol.5, no.2, p.145-50 (April 1983). An experimental microcomputer controlled prosthesis is discussed, where knee damping is governed by kinematic signals, picked up from both legs. The control algorithm is based on division of the walking cycle into ten stages; each stage characterized by an appropriate damping level which governs the restraining moment at the knee, as functionally required. Stage identification is carried out by the kinematic inputs. The experimental prosthesis was tested on one amputee, the first author of this paper. The control system was found

to be more advantageous than a conventional valve system in significantly reducing hip muscular effort on the prosthetic side. Gait symmetry is also improved. (10 refs.)

87.80 BIOPHYSICAL INSTRUMENTATION AND TECHNIQUES

- 64004 Simple computer method for evaluation of lateral diffusion coefficients from fluorescence photobleaching recovery kinetics. E.J.J.Van Zoelen, L.G.J.Tertoolen, S.W.de Laat (Hubrecht Lab., Internat. Embryological Inst., Utrecht, Netherlands). *Biophys. J. (USA)*, vol.42, no.1, p.103-8 (April 1983). A method is presented for the analysis of fluorescence photobleaching recovery curves. Based on the simplified kinetic expression of J. Yguerabide et al. (see *ibid.*, vol.40, p.69-75, 1982), a linearization procedure is described that permits unequivocal determination of all diffusion parameters. The presence of additional membrane flow or multiple diffusion coefficients can easily be detected by this method, and simple corrections for the presence of these alternative recovery processes can be made by the use of a regular mini-computer. The validity of the method is tested on simulated recovery curves, varying the contribution of flow, multiple diffusion coefficients, and statistical noise due to counting error. (9 refs.)
- 64005 Studying microbial growth processes with a microcomputer. K.F.Thompson, T.M.Roberts (Dept. of Chem., Bedford Coll., London, England). *Lab. Microcomput. (GB)*, vol.1, no.3, p.11-14 (Autumn 1982). Describes a system based on the Research Machines RML 380Z microcomputer to collect data on energy changes associated with microorganism growth, analyse the data, and produce output on cassette tape or line printer. Data acquisition is carried out in Z80 machine-code, while analysis is performed using BASIC programs. (no refs.)
- 64006 A new system for ventilating with high-frequency oscillation. Y.K.Ngeow, W.Miltzner (Dept. of Anesthesiology & Critical Care Medicine, Johns Hopkins Univ., Baltimore, MD, USA). *J. Appl. Physiol. (USA)*, vol.53, no.6, p.1638-42 (Dec. 1982). [received: April 1983] Describes simple high-frequency oscillation systems that incorporate a CO₂ absorber and supply O₂ on a need basis. These systems have the advantage of easy control of mean airway pressure and airway hydration and negligible loss of oscillatory tidal volume. Experiments done at constant tidal volume showed that as frequency (and hence total ventilation) increased, arterial CO₂ tension Paco₂ decreased. The fall in Paco₂ occurred until frequency reached approximately 20 Hz; above 20 Hz further increases in frequency had little or no effect on Paco₂. Because of their practical advantages the techniques described here may be quite useful in a clinical setting where an oscillator, rather than jet-type high-frequency, ventilation system is desired. (11 refs.)
- 64007 A feedback system to control blood flow in dog lung lobes. R.E.Brake, D.K.Adcock, R.L.Scott, J.C.Gabel (Dept. of Anesthesiology, Univ. of Texas Medical School, Houston, TX, USA). *J. Appl. Physiol. (USA)*, vol.53, no.6, p.1650-2 (Dec. 1982). [received: April 1983] An electromechanical feedback system has been developed to control blood flow to the lower left lung lobe of dogs. Blood flow is measured with an electromagnetic flowmeter. The feedback system compares the blood flow signal to an adjustable reference voltage and causes a motor to turn. The direction of motor rotation depends on the relative magnitude of the flow signal and the reference. The motor pushes the plunger or a syringe that is attached to a balloon in the right pulmonary artery. Inflation of the balloon causes increased blood flow to the lower left lobe. The authors have used the system to control lobe blood in three dogs. (2 refs.)
- 64008 Automated techniques for the study of lung alveolar stereological parameters with the IBAS image analyser on optical microscopy sections. J.P.Rigaut (Lab. de Biologie du Dev., UER Experimentale Biomedicale de Bobigny-Paris Nord, Bobigny, France), P.Berggren, B.Robertson. *J. Microsc. (GB)*, vol.130, pt.1, p.53-61 (April 1983). In the case of lung alveoli, the good contrast of the features allows the use of a fully automated image analysing procedure, yielding many of the desirable stereological parameters which can be estimated on optical microscopy slides: alveolar volume and surface densities, a form factor and average mean integral curvature. With the authors' program, specially designed for the IBAS image analyser (Kontron Bildanalyse, Munich, BRD), the whole automated process takes an average of 28 s per field. The image analyser-obtained stereological estimates compare well with those given by point and intersection counting methods. Some difficulties inherent in image analysers arise when measuring alveolar boundary lengths: a scheme is therefore proposed which eliminates the image-edge errors, with no sampling bias, by comparing three different frames inside each field. A solution to the problem of estimating automatically the positive and negative tangent counts, necessary for the curvature calculations, is also proposed. The authors' program has been applied routinely to the study of premature newborn rabbit lung alveoli, as part of a study dealing with an evaluation of the possibility of preventing the respiratory distress syndrome by the administration of heterologous surfactant. (32 refs.)
- 64009 The correlation of light and electron microscope observations. W.T.Perrie, D.M.Webb (Wolf Neuropathology Labs., Midland Centre for Neurosurgery & Neurology, Warley, England). *J. Microsc. (GB)*, vol.130, pt.1, p.73-7 (April 1983). A technique is described to allow electron microscopic investigation of a specific feature of a section on a glass slide. A section on a glass slide (previously treated with a silicone release agent) is processed as required for light microscopy. The section is then impregnated with Araldite and cured with an epoxy resin block on top of it. The section and block are removed from the side and viewed with a light microscope. The selected area for ultrastructural study remains under continuous observation while the block is trimmed. Semi-thin (1 μ m) sections retain the original staining for light microscopy and ultra-thin sections are stained with heavy metals in the normal manner. The authors show how an inflammatory lesion in a large area of muscle in a case of polymyositis may be quickly located and studied at the ultrastructural level. (14 refs.)

64010 A routine flat embedding method for electron microscopy of microorganisms allowing selection and precisely orientated sectioning of single cells by light microscopy. O.L.Reymond, J.D.Pickett-Heaps (Dept. de Biologie Vegetale, Univ. de Geneve, Geneve, Switzerland). *J. Microsc. (GB)*, vol.130, pt.1, p.79-84 (April 1983).

A simple method is described to embed material in resin, in the form of microscope slides, to observe it with high resolution light microscopy, to select, orient and section it for TEM. This method can be applied to many kinds of material but is particularly useful for the study of rare or tiny plant or animal microorganisms from field or culture. A diamond scribe, translucent hydrosoluble resin release agent, translucent and smooth resin stubs and a longitudinally perforated block-holder for ultramicrotome are the specific tools of this method. (11 refs.)

64011 BSE Z contrast imaging of uranium stained pores in the avian eggshell. H.Silyn-Roberts (Dept. of Zoology, Univ. of Auckland, Auckland, New Zealand).

J. Microsc. (GB), vol.130, pt.1, p.111-14 (April 1983).

A method is described for estimating the number of blocked pore channels and pore density and spatial distribution by the staining of the exterior pore openings of unobstructed pores with uranyl acetate, and identification of them using backscattered electron atomic number contrast imaging in the scanning electron microscope. (9 refs.)

64012 Enhancement of contrast in living and fixed specimens by the use of fibre optics. A.M.C.Burgess (Dept. of Anatomy & Histology, London Hospital Medical Coll., London, England).

J. Microsc. (GB), vol.130, pt.1, p.123-4 (April 1983).

A method is described which enhances the contrast of living and fixed specimens examined with the stereomicroscope. It consists of immersing the ends of flexible fibre optic light sources together with the specimen in the fluid used for examination. It is reported that not only does this method increase the contrast of living specimens but that it may also be applied to specimens being prepared as thin sections of freeze fracture surfaces for examination with the transmission electron microscope. A further method of enhancement of contrast is suggested which involves the fitting of light filters of complementary colours, one to each of the fibre optic light sources, before immersion with the specimen. (3 refs.)

64013 Measurement of cardiac pressure-length loops using an improved sonomicrometer. Accuracy and effect of respiration. K.Matre, J.Lekven (Surgical Res. Lab., Univ. of Bergen, Bergen, Norway).

J. Biomed. Eng. (GB), vol.5, no.2, p.110-16 (April 1983).

A transit-time sono-micrometer for measurement of myocardial dimensions is described. Crystals of frequencies 1-10 MHz can be used, enabling a large range of distances to be measured. The meter has two channels, operated in sequence to avoid interference between channels. By combining local muscle segment length with the left ventricular pressure in open-chest cats, the pressure-length loop for that segment was continuously displayed. A calibration procedure was developed, permitting calibration to be registered on a recorder and on a storage monitor at any time. Detailed interpretation of loops from normal and ischaemic segments of the left ventricle is presented. Variation of the loop form with respiration is demonstrated, which clearly necessitates a standardized reference point in the respiratory phase for comparing loops from two or more experimental situations. (16 refs.)

64014 A versatile localization system for microscopic multiparametric analysis of cells. H.H.Thaw, I.Rundquist, U.Johnsson, I.Svensson, V.P.Collins (Dept. of Pathology II Univ. of Linköping, Linköping, Sweden).

Microsc. Acta (Germany), vol.87, no.2, p.159-67 (March 1983).

A new, simple and relatively inexpensive electronic digital position readout (DPRO) system which can be applied to the rapid localization and recovery of microscopic material is described. It is based upon a commercially available digital position readout system which is routinely utilized by industry for small machine tools and measuring equipment. This has been mounted onto the stage of various microscopic instrumentation to provide X and Y coordinates relative to an arbitrary reference point. The integration of small computers interfaced to scanning interferometric, microdensitometric and fluorescence microscopes were used to demonstrate the reliability, versatility and ease of application of this system to problems of multiparametric measurements and analysis of cultured cells. The system may be expanded and applied to clinical material to obtain automatized, multiparametric measurements of cells in hematology and clinical cytology. (15 refs.)

64015 Biological applications of picosecond spectroscopy. E.F.Hilinski, P.M.Rentzepis (Bell Labs., Murray Hill, NJ, USA).

Nature (GB), vol.302, no.5908, p.481-7 (7 April 1983).

Technological advances in picosecond spectroscopy have permitted the mechanisms of various chemical, physical and biological processes to be elucidated and understood to a greater degree than ever before. By means of picosecond emission, absorption and Raman spectroscopy, one can probe and measure directly the transient intermediates and kinetics of primary events in complex biological processes. A description of two current types of laser systems—solid-state and synchronously pumped dye lasers—and their application to determining the primary events in the biological processes of dissociation of oxy- and carboxymyoglobin, excited-state relaxation of porphyrins and visual transduction, illustrate the power of picosecond spectroscopy. (47 refs.)

64016 A new method of scanning electron microscopy for imaging biological tissues. A.Boyd, S.A.Reid (Dept. of Anatomy & Embryology, Univ. Coll. London, London, England).

Nature (GB), vol.302, no.5908, p.522-3 (7 April 1983).

Reports a method by which histological sections mounted on glass slides can be imaged in the SEM at a resolution higher than that obtained using conventional light microscopy. The method exploits the facts that the ordinary, cheap light microscope slide is strongly cathodoluminescent, yet the standard histological (7 μ m) section is of such a mass thickness that it absorbs a significant proportion of electrons with energies (5-20 keV) usually used in biological SEM. Thus the measure of the glass cathodoluminescence signal is the measure of the electron flux passing through the specimen. (1 ref.)

64017 Detection of signal of rapid eye movements. M.Nishikawa, N.Ishii, A.Iwata, N.Suzumura (Faculty of Engng., Nagoya Inst. of Technol., Nagoya, Japan).

Trans. Inst. Electron. & Commun. Eng. Jpn. Part D (Japan), vol.J66D, no.1, p.33-40 (Jan. 1983). In Japanese.

Signals of rapid eye movements show the state of a sleeping stage called REM. Differential operations with smoothing are effective in the extraction of the signals. First, to remove noise from the data of the rapid eye movements, the authors developed a Wiener filtering method, which extracts the reciprocal phase signals of the movements. Second, they applied a correlation method, which characterized the negative correlation of the movements. The latter method was found to be useful in the signal detection of the movements. (8 refs.)

64018 Observation and simulation of unstained DNA images in bright field TEM. C.Quintana (Unité de Recherche, INSERM, Paris, France), N.Bonnet.

Ultramicroscopy (Netherlands), vol.10, no.3, p.253-61 (1982).

Images of unstained, unshadowed DNA prepared by the Kleinschmidt method have been obtained in bright field TEM with a usable contrast. Operating conditions include a strong defocus and a highly coherent illuminating beam. Observations suggest that a specific interaction exists between the nucleic acid and the carrier protein: cytochrome C. Computer simulations of beam-specimen interaction and of image formation were performed. The calculated dependence of contrast on defocus agrees qualitatively with the experimental results. The authors conclude that experiments with unstained biological specimens are feasible and are necessary (in spite of difficulties) to corroborate results obtained with stained material. (30 refs.)

87.90 OTHER TOPICS IN BIOPHYSICS, MEDICAL PHYSICS, AND BIOMEDICAL ENGINEERING

64019 At what wavelengths should we search for signals from extraterrestrial intelligence? C.H.Townes (Univ. of California, Berkeley, CA, USA).

Proc. Natl. Acad. Sci. USA, vol.80, no.4, p.1147-51 (Feb. 1983).

It has often been concluded that searches for extraterrestrial intelligence (SETI) should concentrate on attempts to receive signals in the microwave region, the argument being given that communication can occur there at minimum broadcasted power. Such a conclusion is shown to result only under a restricted set of assumptions. If generalized types of detection are considered—in particular, photon detection rather than linear detection alone—and if advantage is taken of the directivity of telescopes at short wavelengths, then somewhat less power is required for communication at infrared wavelengths than in the microwave region. Furthermore, a variety of parameters other than power alone may be chosen for optimization by an extraterrestrial civilization. Hence, while partially satisfying arguments may be given about optimal wavelengths for a search for signals from extraterrestrial intelligence, considerable uncertainty must remain. (6 refs.)

64020 Time adjustment on 1983 June 30.

I.A.U. Circ. (USA), no.3790, 1 pp. (7 April 1983).

It is announced that a positive leap second will be introduced on 1983 June 30 such that the sequence of UTC second markers will be: 1983 June 30^d23^h59^m59^s, 30^d23^h59^m60^s, July 1st00^h00^m00^s. From 1982 July 1 to 1983 June 30 the difference UTC-TAI=-21^s, beginning 1983 July 1, UTC-TAI=-22^s. (no refs.)

64021 Earth measurement as part of a unified geodesy—foundations, state-of-the-art, and trends of development. G.W.Hein.

Z. Vermessungswes. (Germany), vol.108, no.3, p.93-104 (March 1983). In German.

After reviewing the main goals of geodesy, the determination of the figure of the Earth is considered mathematically within the framework of an integrated or operational model determining in one unified approach three-dimensional geocentric coordinates as well as the functionals of the gravity potential (geoid, deflections of the vertical, etc.). Current geodetic measurement techniques and new techniques likely to come into use soon are considered. The state-of-the-art of accuracy, resolution and other parameters is discussed. Trends and prospects of future geodetic technology are considered. (26 refs.)

64022 The choice of the datum of a trigonometric net for interpolation of points. K.R.Koch.

Z. Vermessungswes. (Germany), vol.108, no.3, p.104-11 (March 1983). In German.

The definition of a datum for a geodetic network in the case of a densification by additional points is discussed. The datum should be established such that the trace of the covariance matrix of the estimated coordinates of the additional points and of the points of the network connected with the additional points becomes minimal. It is shown that such a datum can be readily obtained by means of the matrix which contains a basis of the nullspace of the coefficient matrix for the model of the parameter estimation. The choice of such a datum is demonstrated by an example. (7 refs.)

91.25 GEOMAGNETISM AND PALAEOMAGNETISM; GEOELECTRICITY

64023 Annual report for magnetic observatories—1980. G.Jansen van Beek, R.L.Coles (Earth Phys. Branch, Energy, Mines & Resources Canada, Ottawa, Canada). *Geomagn. Ser. Earth Phys. Branch (Canada)*, no.23, p.1-90 (1983). In English, French.

In 1980, the Earth Physics Branch operated a network of 12 magnetic observatories. Several variation stations were also operated for parts of the year. The author describes the station sites, the instrumentation and the methods of data reduction and distribution. (15 refs.)

64024 On the resolving power of the VLF method. V.Bezvoda (Faculty of Sci., Charles Univ., Czechoslovakia), K.Segeth. *Pure & Appl. Geophys. (Switzerland)*, vol.120, no.2, p.348-64 (1982). The mathematical tools, used for the modelling of the electromagnetic field of the harmonic plane wave in the two-dimensional inhomogeneous medium (the case of *E*-polarization), are presented. Further, the resolving power of some parameters, that are measured in the VLF and VLF-R methods, is compared in the case of two vertical conductive dykes. To this aim, all the usual parameters of the VLF method and the most important parameter of the VLF-R method (ρ_n) have been chosen. Two groups of models that differ in resistivities have been considered. In each of the groups the distance of the dykes is variable. The parameters $|H_z|$, which has shown most promising in this respect, is examined also from the point of view of the sensibility to geological noise. The results of the modelling are illustrated by two examples of the results of field measurements. (15 refs.)

64025 A Fourier transform method for the interpretation of self-potential anomalies due to two-dimensional inclined sheets of finite depth extent. D.Atchuta Rao, H.V.Ram Babu, G.D.J.Sivakumar Sinha (Nat. Geophys. Res. Inst., Hyderabad, India). *Pure & Appl. Geophys. (Switzerland)*, vol.120, no.2, p.365-74 (1982). The self-potential anomaly due to a two-dimensional inclined sheet of finite depth extent has been analysed in the frequency domain using the Fourier transform. The expression of the Fourier amplitude and phase spectra are derived. The Fourier amplitude and phase spectra are analysed so as to evaluate the parameters of the sheet. Application of this method to two anomalies (synthetic and field data) has given good results. (7 refs.)

64026 Palaeomagnetism of Africa and Madagascar. A.Brock (Appl. Geophys. Unit, Univ. Coll. Galway, Galway, Ireland). In book: *Paleoreconstruction of the continents*, M.W.McElhinny, D.A.Valencio [Ed.], p.65-76. Washington, DC, USA: American Geophysical Union (1981), 194 pp.

Palaeomagnetic results from Africa have increased substantially in number since 1970 especially for the Precambrian. Noteworthy is the now very complete coverage of the Mesozoic, together with a good comparison between Madagascar and Africa which yields a paleoposition for Madagascar close to the East African coast. The Paleozoic is less well covered and much of the Karroo Supergroup remains to be sampled in detail. The Precambrian data is of very variable quality, but it helps to define the apparent polar wander path with greater certainty than previously. Many gaps remain, however, and a much higher density of data will be required. Careful multi-component studies have begun to appear and these must play an increasingly important role in the future work. (96 refs.)

64027 A review of the paleomagnetism of Australia and Antarctica. B.J.J.Embleton (Div. of Mineral Phys., CSIRO, North Ryde, NSW, Australia). In book: *Paleoreconstruction of the continents*, M.W.McElhinny, D.A.Valencio [Ed.], p.77-92. Washington, DC, USA: American Geophysical Union (1981), 194 pp.

Australia and East Antarctica were juxtaposed for the whole of Paleozoic and Mesozoic time. Post-Archean unity of the crustal nuclei that comprise the main Australian platform has been demonstrated, but insufficient Precambrian palaeomagnetic data from East Antarctica preclude confirmation of its Proterozoic reconstruction to Australia. Apparent polar wander (APW) relative to Australia is reasonably well understood for the Phanerozoic and the Proterozoic to about 2500 Myr. Problems highlighted include the resolution of APW between 2300 and 1800 Myr and between 1800 and 1700 Myr. Nor is it clear in which hemisphere Australia resided during the Early Paleozoic. A complex Mesozoic drift history for Australia has been elucidated following the recognition and discrimination between multi-component magnetisation vectors. Cenozoic APW reflects Australia's general northward drift since its separation from Antarctica 53 Myr ago. Data from the Antarctic Peninsula do not support post-Late Cretaceous oroclinal bending and show that little latitudinal movement has taken place in the last 100 Myr. (110 refs.)

64028 Phanerozoic palaeomagnetism of the Indian plate and the India-Asia collision. C.T.Klootwijk (Res. School of Earth Sci., Australian Nat. Univ., Canberra, Australia), C.Radhakrishnamurti. In book: *Paleoreconstruction of the continents*, M.W.McElhinny, D.A.Valencio [Ed.], p.93-105. Washington, DC, USA: American Geophysical Union (1981), 194 pp.

Summarizes Phanerozoic palaeomagnetic data from Peninsular and Extrapeninsular Indo-Pakistan obtained during the last decade. The data are interpreted in terms of Indo-Pakistan's drift with reference in particular to post-collisional deformation of Extrapeninsular Indo-Pakistan and south central Asia. Compilation of a Precambrian apparent polar wander path seems ambiguous because of poor age control and insufficient evidence for a primary or a secondary origin of the palaeomagnetic data. (75 refs.)

64029 Palaeomagnetism of South American rocks and the dynamic processes related with the fragmentation of western Gondwana. J.F.A.Vilas (Dept. de Ciencias Geologicas, Ciudad Univ., Buenos Aires, Argentina). In book: *Paleoreconstruction of the continents*, M.W.McElhinny, D.A.Valencio [Ed.], p.106-14. Washington, DC, USA: American Geophysical Union (1981), 194 pp.

Reliable South American palaeomagnetic data, presented during the last decade, are reviewed. These data define the different episodes of the geodynamic evolution of western Gondwana. The Palaeomagnetic and sea-floor spreading data are used to define the movements associated with the fragmentation of western Gondwana and the origin of the South Atlantic. (43 refs.)

64030 Pre-Neogene palaeomagnetism of Japanese islands (and vicinities). S.Sasajima (Dept. of Geology & Mineralogy, Kyoto Univ., Kyoto, Japan). In book: *Paleoreconstruction of the continents*, M.W.McElhinny, D.A.Valencio [Ed.], p.115-28. Washington, DC, USA: American Geophysical Union (1981), 194 pp.

A set of rigorous criteria has been applied to the Japanese pre-Neogene palaeomagnetic data to discriminate the normal palaeomagnetic data from anomalous ones which could have been influenced by various causes such as local tectonic movements, local geomagnetic anomalies and geomagnetic reversals of polarity. A set of apparent polar wander paths since Cretaceous time for southwest and northeast Honshu, the main island of Japan, has been drawn. Several anomalous palaeomagnetic poles suggest extensive tectonic movements. A plausible Cretaceous reconstruction map of Honshu is presented, along with its tectonic evolutionary history. The paleolatitudinal variation of SW Honshu since the Upper Carboniferous is obtained. (83 refs.)

64031 Palaeomagnetism of southeast and east Asia. N.S.Haile. In book: *Paleoreconstruction of the continents*, M.W.McElhinny, D.A.Valencio [Ed.], p.129-35. Washington, DC, USA: American Geophysical Union (1981), 194 pp.

The decade 1970-1979 saw the first palaeomagnetic work in southeast Asia, providing a useful constraint on palaeomagnetic reconstructions. The results enable a start to be made in defining boundaries of 'microplates' or major structural blocks in the region. Southeast and east Asia have an extremely complex tectonic history, and are a region of the world with very sparse palaeomagnetic data available. The results so far, although scattered, are sufficient to demonstrate the potential of the method for elucidating the tectonic and paleogeographic history of the region. (26 refs.)

64032 Pre-Carboniferous palaeomagnetism of Europe north of the Alpine orogenic belt. J.C.Briden (Dept. of Earth Sci., Univ. of Leeds, Leeds, England), B.A.Duff. In book: *Paleoreconstruction of the continents*, M.W.McElhinny, D.A.Valencio [Ed.], p.137-49. Washington, DC, USA: American Geophysical Union (1981), 194 pp.

Pre-Carboniferous palaeomagnetic data for Europe north of the Hercynian front and some areas within the Hercynian belt are reviewed and catalogued. A tentative apparent polar wander (APW) path for the Baltic Shield and the British Isles is presented which implies over 180° of relative polar shift in late Proterozoic and early Paleozoic time. Incorporation of Armorican data into this path implies that Armorica may have been attached to northern Europe and that any 'proto-Hercynian' ocean between this northern continent and Gondwana in the Paleozoic lay to the south of the Armorican massif. Comparisons of APW data from northern Europe and North America suggests that these areas may have been joined at least for some intervals within the late Proterozoic or early Paleozoic. (61 refs.)

64033 Pre-Cenozoic palaeomagnetism of southern Europe/Middle East. H.Wensink (Inst. voor Aardwentschappen Utrecht, Utrecht, Netherlands). In book: *Paleoreconstruction of the continents*, M.W.McElhinny, D.A.Valencio [Ed.], p.151-7. Washington, DC, USA: American Geophysical Union (1981), 194 pp.

The southern Europe-Middle East palaeomagnetic data have been divided into smaller units. In general, these smaller areas can be regarded as individual structural provinces. Palaeomagnetic studies of the Italian Peninsula, Iran and Afghanistan, Iberia and the Bay of Biscay, are reviewed. The structural evolution, of both Pannonia and south-eastern Europe is still poorly understood. (78 refs.)

64034 Palaeomagnetism of North America: a brief review. R.Van der Voo (Dept. of Geological Sci., Univ. of Michigan, Ann Arbor, MI, USA). In book: *Paleoreconstruction of the continents*, M.W.McElhinny, D.A.Valencio [Ed.], p.159-76. Washington, DC, USA: American Geophysical Union (1981), 194 pp.

An updated version of the apparent polar wander path of the North American craton is presented. Displaced terranes and possible microplates are identified which have yielded pole positions divergent from the cratonic apparent polar wander path; these displaced terranes are found on the eastern as well as the western side of the North American craton. (364 refs.)

64035 Palaeomagnetism of the Soviet Union. A.N.Khranov (All Union Oil Res., Geological Prospecting Inst., Leningrad, USSR), G.N.Petrova, D.M.Pechersky. In book: *Paleoreconstruction of the continents*, M.W.McElhinny, D.A.Valencio [Ed.], p.177-94. Washington, DC, USA: American Geophysical Union (1981), 194 pp.

Reviews the contributions Soviet palaeomagnetic researchers have made on three topics: synthesis of palaeomagnetic data on Russian and Siberian plates and surrounding areas; studies of events in tectonically active zones; and geodynamical characteristics of the palaeomagnetic field. The review is followed by a complete table of pre-Neogene valid palaeomagnetic poles from the territory of the USSR and key references for the period 1970-1979. (29 refs.)

64036 Marine magnetic anomalies from the western Philippine Sea: implications for the evolution of marginal basins. Tai-Chang Shih (Geophys. Lab., Univ. of Texas, Austin, TX, USA).

In book: *Tectonic and geologic evolution of southeast asian seas and islands*, D.E.Hayes [Ed.], p.49-75. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

A set of newly processed data is presented together with all available magnetic anomaly data from the West Philippine Basin. These combined data have made it possible to deduce the lineation patterns in this basin and to interpret the tectonic history of the western Philippine Sea. The correlations of magnetic anomalies agree very well with DSDP results and the inferred history of plate motions also agrees well with land geology of the area. The correlations indicate that the crust of the West Philippine Basin started to form before anomaly 25 time (~59 m.y. BP), probably at the ridge that was the southern boundary of the Pacific plate at that time. The West Philippine marginal basin, however, was probably formed by the entrapment of oceanic crust following the reorganization of plate boundaries in the Pacific about 40 m.y. BP. Spreading in this basin was active until anomaly 7A time (~26 m.y. BP). Estimates of the past plate motion and paleolatitude, from phase shifting the magnetic anomalies, suggest that the West Philippine Basin has

drifted north about 15° - 20° and has undergone clockwise rotation of about 50° - 70° since 35-40 m.y. BP. (72 refs.)

64037 Paleomagnetism of Truk Islands, eastern Carolines and of Saipan, Marianas. M.Fuller, J.R.Dunn, G.Green, Jin-Lu Lin, R.McCabe, K.Toney, I.Williams (Dept. of Geological Sci., Univ. of California, Santa Barbara, CA, USA).

In book: *Tectonic and geologic evolution of southeast asian seas and islands*, D.E.Hayes [Ed.], p.235-45. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

Paleomagnetic results from Miocene flows from the Truk Islands reveal stable magnetization having a declination of $+2^{\circ}$ and an inclination of $+6^{\circ}$, with an α_{95} of 6.8 and a k of 45.4. This is different from the present dipole field at the 95% confidence level. Ten sites are included in the analysis so that major departures from the true mean field direction due to secular variation should have been eliminated. The result gives an ancient latitude of 3° N with a $\pm 3^{\circ}$ confidence interval, which is consistent with proposed rotation about the Hawaiian hot spot pole at a rate of $1.3^{\circ}/10^6$ years for the past 10 million years. The directions of magnetization of flows of Eocene and Miocene age from Saipan reveal a mean direction of magnetization rotated clockwise from the present field direction. Although there are fewer results available from Saipan than from Truk, the results appear to be recording some tectonic rotation and not simply secular variation. The Marianas limestone of Pleistocene age has a direction of magnetization concordant with the present field. These results from Truk and Saipan reveal that tectonic models can indeed be tested in island arc and oceanic island environments by paleomagnetic observations. It is also clear that the paleomagnetism of such islands suffers from inadequate numbers of available sites and difficulties in establishing tectonic control. The similarity of the rotation observed at Saipan and Guam strongly suggests that tectonic models of the Marianas must account for major rotation of the southern end of the Marianas since their formation. (10 refs.)

64038 Paleomagnetic synthesis for southeast Asia: constraints on plate motions. R.D.Jarrard (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA), S.Sajima.

In book: *Tectonic and geologic evolution of southeast asian seas and islands*, D.E.Hayes [Ed.], p.293-316. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

Paleomagnetic data from Southeast Asia have been compiled, graded as to reliability, and compared and synthesized to investigate their usefulness in constraining models for the plate tectonic evolution of the region. Polar paths for the major plates, Pacific, Philippine, and Asian, are only approximately known at present. The Pacific plate has undergone a northward motion of 2-4 cm/y for the past 100 m.y., with little rotation. In contrast, the Philippine plate may have been rotating clockwise during the last 60 m.y., with 4-10 cm/y of northward motion (at least for the last 20 m.y.). The northeast portion of the Asian plate experienced about 25° C of clockwise rotation and negligible latitudinal shift since the Cretaceous. On the southeastern part of the Asian plate, the Malay Peninsula, West Kalimantan (Borneo), and southwestern Sulawesi yield very similar late Mesozoic poles, suggesting little subsequent differential movement between these areas and indicating about 50° of counterclockwise rotation and little latitudinal shift during the Tertiary. Paleomagnetic results from islands arcs emphasize the role of small block rotations behind trenches. (147 refs.)

91.30 SEISMOLOGY

64039 Spreading of slip from a region of low friction. M.Comminou (Univ. of Michigan, Ann Arbor, MI, USA).

Acta Mech. (Austria), vol.47, no.1-2, p.65-71 (1983).

Recent models of earthquake faults involve heterogeneous slip regions along the faults. Some of this work suggests the following problem: two solids of different material properties are pressed together and sheared. Then, slip propagates asymmetrically from a region of low friction. (6 refs.)

64040 A boundary layer theory for Rayleigh waves in a porous, fluid-filled half space. M.A.Foda (Kuwait Inst. for Sci. Res., Safat, Kuwait), C.C.Mei.

Int. J. Soil Dyn. & Earthquake Eng. (GB), vol.2, no.2, p.62-5 (April 1983).

The application of Biot's poro-elasticity equations to the propagation of seismic waves in saturated rock is studied. This theory assumes that the rock is linearly elastic and that the pore fluid obeys Darcy's law. In this article a general boundary layer approximation of Biot's equation is used to study rapidly damped elastic waves in a half-space. (12 refs.)

64041 Amplification of P, SV, and Rayleigh waves by two alluvial valleys. M.Dravinski (Dept. of Mech. Engng., Univ. of Southern California, Los Angeles, CA, USA).

Int. J. Soil Dyn. & Earthquake Eng. (GB), vol.2, no.2, p.66-77 (April 1983).

A plane strain model for the amplification of harmonic waves by two alluvial valleys of arbitrary shape embedded in a half-space is investigated by using a boundary integral method. Perfect bonding between the valleys and the half-space is assumed. The displacement field is evaluated throughout the elastic medium for linearly elastic, homogeneous and isotropic materials so that the continuity conditions between the valleys and the half-space are satisfied in a mean-square-sense. Numerical results are presented for two semi-elliptical valleys for the incident plane P, SV, and Rayleigh waves for different angles of incidence (for P and SV-waves), frequency of incoming waves, and material properties of the valleys. The results indicate the following: (1) different incident waves caused different surface displacement amplification; (2) the presence of additional valleys may change the surface motion field significantly; (3) a strong ground motion amplitude appears to be very sensitive to the frequency of incoming waves and depends on material properties of the valleys and the half-space. (25 refs.)

64042 Seismicity and earthquake hazard in Trinidad and Tobago, West Indies. J.B.Sherpherd, W.P.Aspinall (Seismic Res. Unit, Univ. of the West Indies, St. Augustine, Trinidad).

Earthquake Eng. & Struct. Dyn. (GB), vol.11, no.2, p.229-50 (March-April 1983).

The two-island Republic of Trinidad and Tobago in the eastern Caribbean has enjoyed increased physical and industrial development in recent years; however, these islands have been subjected to damaging earthquakes during their history and an up-to-date risk assessment is needed. The authors examine two approaches to quantifying this problem: (a) the risk estimated pro-

babilistically using recent instrumental data and (b) the hazard inferred from regional tectonic movements. The probabilistic approach indicates that peak ground accelerations with a probability of exceedance of 10 per cent in 50 years could range from 0.23 g in Tobago to 0.36 g in North-West Trinidad. Tectonic considerations suggest that a maximum-moment earthquake occurring directly under either land mass could generate accelerations as high as 0.6 g; the probability of occurrence of such an event is estimated to be about 2 per cent in 50 years for Trinidad and about a tenth this risk for Tobago. (50 refs.)

64043 A coda-length magnitude scale for New England. M.P.Chaplin, S.R.Taylor, M.N.Toksoz (Dept. of Earth & Planetary Sci., MIT., Cambridge, MA, USA).

Earthquake Not. (USA), vol.51, no.4, p.15-22 (Oct.-Dec. 1980). [received: April 1983]

An empirical coda-length (signal duration) magnitude scale is developed to estimate magnitudes for earthquakes in New England. The formula is based on the mean signal duration, T (in seconds), measured from 45 local earthquakes and is given by: $m_b(Lg) = 2.21 \log_{10}(T) - 1.70$. For epicentral distances less than 600 km, the distance dependence is found to be negligibly small in comparison to other errors. Regional variations in signal duration suggest higher attenuation in southeastern New England than in New Hampshire. (12 refs.)

64044 The Charlevoix earthquake of 19 August 1979 and its seismo-tectonic environment. H.S.Hasegawa, R.J.Wetmiller (Earth Phys. Branch, Energy, Mines & Resources Canada, Ottawa, Canada).

Earthquake Not. (USA), vol.51, no.4, p.23-37 (Oct.-Dec. 1980). [received: April 1983]

The focal mechanism has been determined for an intermediate-magnitude earthquake in the most seismically active region in Eastern Canada. On August 19, 1979, an $m_b(Lg)$ 5.0 earthquake occurred in the Charlevoix seismic zone, under the St. Lawrence River near the town of St. Fidele and La Malbaie, Quebec. The P-wave nodal solution indicates thrust faulting on both nodal planes. From an analysis of surface wave data of the main shock, an estimate of focal depth falls in the range 6-11 km, in agreement with after-shock data. A mean value of the aftershock area is 3.5 km^2 , which is taken to represent the fault area of the main shock, and under the assumption of a circular fault, the stress drop of the main shock is estimated to be 50 bars. Because of the presence of zones of weakness in the epicentral area, the direction of maximum principal stress is only loosely constrained. (35 refs.)

64045 Field investigation and fault plane solution of the Bath, Maine earthquake of April 18, 1979. J.J.Pulli, R.R.Stewart, J.C.Johnston, K.M.Tubman, A.Michaels (Dept. of Earth & Planetary Sci., MIT, Cambridge, MA, USA).

Earthquake Not. (USA), vol.51, no.4, p.39-46 (Oct.-Dec. 1980). [received: April 1983]

On April 18, 1979 an $m_b(Lg)$ 4.0 earthquake occurred near Bath, Maine, and was followed by a number of aftershocks within five hours. A four-station temporary network was deployed around the epicenter for three days and recorded two possible aftershocks. Intensity interviews were also conducted with fifty-five residents of the area. Many residents reported observing intensity effects similar to those of historical New England earthquakes, such as booming sounds rather than low-frequency rumblings normally associated with ground shaking. Reports of unusual animal behavior prior to the earthquake were given by a number of the residents. The fault plane solution was determined for this event. (7 refs.)

64046 The Giles County, Virginia, seismic zone. G.A.Bollinger (Virginia Polytech. Inst., Blacksburg, VA, USA), R.L.Wheeler.

Science (USA), vol.219, no.4588, p.1063-5 (4 March 1983).

A well-defined seismic zone detected in Virginia has an orientation that is not related to the surrounding geologic structures. The orientation of the zone appears to be related to features below the Appalachian overthrust belt. A damaging earthquake that is important in evaluating seismic hazard in the southeastern United States may have occurred in the zone in 1897. (18 refs.)

64047 The tsunami of 23 November 1969 at Kamchatka and certain aspects of its occurrence. Yu.A.Zayakin (Petrovavsk-Kamchatskii Hydrometeorological Obs., USSR).

Sov. Meteor. & Hydrol. (USA), no.12, p.60-5 (1981). Translation of:

Meteorol. & Gidrol. (USSR), no.12, p.77-83 (1981).

A tsunami that occurred as a result of a severe earthquake in the southwestern Bering Sea is described and analyzed. The contours of the tsunami source are determined and the calculated tsunami-wave propagation times are charted. The causes of the tsunami are discussed, and it is concluded that a suspension flow formed after the earthquake and was one of the factors in the formation of the tsunami. It is proposed that the Kurile-Kamchatka tsunamigenic belt be extended northward along the continental slope to the parallel of 58° N. (9 refs.)

64048 Magnitude scale and quantification of earthquakes. H.Kanamori (Seismological Lab., California Inst. of Technol., Pasadena, CA, USA).

Tectonophysics (Netherlands), vol.93, no.3-4, p.185-99 (1983).

Despite various shortcomings, the earthquake magnitude scale is one of the most fundamental earthquake source parameters to be used for catalogs. Although use of a uniform scale is desirable, it is not always possible because of changes in instrumentation, the data reduction method and the magnitude formula, the station distribution, etc. As a result, various magnitude scales have been developed and are currently in use. Recent development in seismometry and earthquake source theories provide more quantitative source parameters than the magnitude. In order to maintain continuity and uniformity of the data, it is important to relate these magnitude scales and the new parameters. In view of this importance, relations between different magnitude scales are examined with an emphasis on the difference in the period of the waves used for the magnitude determination. Use of several magnitude scales determined at different periods provides a convenient method for characterizing earthquakes.

64049 A scheme for the classification of earthquakes. G.Purcaru, H.Berckhemer (Inst. fur Meteorologie und Geophys., J.W. Goethe Univ., Frankfurt/Main, Germany).

Tectonophysics (Netherlands), vol.93, no.3-4, p.201-2 (1983).

A schematic classification of earthquakes in terms of 'earthquake classes' developed earlier (Purcaru and Berckhemer, 1979, 1982) is further quantified and analyzed from a unified point of view. This multiple classification reflects the non-similarity of earthquakes and allows a unified systematization of departures from the similarity law with respect to the basic features characterizing the source process, i.e. 'FM': faulting mode (f), 'C': complexity (j), 'G': geometry (k), 'S': strain/stress (l), 'F': frequency content (m) and 'T': temporal (n). An earthquake can thus be represented as a 6-dimensional vector (j,k,l,m,n) and a 'reference earthquake' was introduced as representative of the class of earthquakes obeying the similarity law. The departures of the components k,l,m,n from those characterizing the class of the reference earthquake were used to introduce various classes of earthquakes, although

they have been only partially defined quantitatively. For a further quantization, the problem is resolved by prescribing adequate limits to classes on the basis of useful criteria derived from source parameter relations.

64050 Amplitude curves of seismic waves on the basis of HMS: observations, comparisons, conceptions. J.Vanek (Geophys. Inst., Czechoslovak Acad. of Sci., Prague, Czechoslovakia), N.V.Kondorskaya, I.V.Fedorova, L.Christoskov.

Tectonophysics (Netherlands), vol.93, no.3-4, p.203 (1983).

On the basis of 32 seismic stations selected in the region of the Eurasian continent, a homogeneous magnitude system (HMS) was established by the method of successive optimization of station corrections and magnitude calibrating functions. The HMS calibrating functions were constructed for longitudinal (PV, PH), shear (SV, SH) and surface (LV, LH) waves recorded by broad band instruments, and for PVs recorded by short period instruments. Dependence of periods of longitudinal, shear and surface waves on epicentral distance was derived. The detailed results are presented in a series of papers being published in the Bulgarian Geophysical Journal (for first two papers on PV, PVs, and PH see Bulg. Geophys. J., 4(2): 74-84 (1978); 7(4): 19-27 (1981)).

64051 Magnitude: the relation of M_L to m_{BLG} . R.B.Herrmann, O.W.Nuttl (Dept. of Earth & Atmospheric Sci., Saint Louis Univ., St. Louis, MO, USA).

Tectonophysics (Netherlands), vol.93, no.3-4, p.204 (1983).

The M_L or local magnitude, scale, was developed to quantify southern California earthquakes. The M_L scale is a measure of the maximum ground motion in the period range of about 0.3-1 sec, as recorded by a standard Wood-Anderson torsion seismograph. In 1973 Nuttl proposed an m_{BLG} scale for eastern North America earthquakes. The m_{BLG} scale is a measure of the ground motion caused by the vertical component of higher-mode Lg waves, of period 1.0 sec. It was set up so that it was numerically equal to m_b as obtained from 1-sec period teleseismic P-wave amplitudes, called m_{bP} . Thus the M_L and m_{BLG} scales, as defined, are independent of each other. Furthermore, the coefficient of anelastic attenuation of 1-sec period waves in California is almost an order of magnitude greater than it is in eastern North America. Observational data show that the near-field excitation of 1-sec period Lg waves by crustal earthquakes is essentially the same throughout the world for earthquakes of a given m_{bP} , after the m_{bP} is corrected for anomalous attenuation in the asthenosphere beneath the epicenter. Using this fact and an independent knowledge of the coefficient of anelastic attenuation for California earthquakes, a formula for m_{BLG} is developed for California. When this formula is applied to earthquakes occurring near the California and Utah WWSN stations, it is found that the m_{BLG} values are numerically equal to M_L as determined by Wood-Anderson seismographs, for earthquakes of magnitude 3-5.

64052 Source parameters of recent strong earthquakes in northeastern Iran from long-period surface waves. M.Niazi, H.Kanamori (TERA Corp., Berkeley, CA, USA).

Tectonophysics (Netherlands), vol.93, no.3-4, p.205 (1983).

The observed R_2 and R_3 phases of the September 16, 1978, Tabas, Iran earthquake across the IDA network are inverted to derive the gross source parameters of the main shock. The synthetic seismograms computed for the inferred source model are compared with observations. The agreement is generally good at most of the stations. However, unexpected asymmetrical observations at CMO, KIP and PFO stations in the northeast-southwest azimuthal directions are observed which cannot be explained by directivity alone. Possible factors responsible for these observations may include regional heterogeneities or the departure of fault plane from simple planar geometry. The resulting focal mechanism agrees with nearly pure reverse mechanism with a NW-SE strike. The seismic moment estimates range from 1.1 to 1.5×10^{27} dyne-cm. Starting with the geologic field data of the Qainat earthquakes of November 14, and 27, 1979, the R_2 and G_2 phases on the ultralong period instruments at Pasadena and Berkeley are analyzed to estimate their seismic source moments.

64053 Empirical magnitude and spectral scaling relations for mid-plate and plate-margin earthquakes. O.W.Nuttl (Dept. of Earth & Atmospheric Sci., St. Louis Univ., St. Louis, MO, USA).

Tectonophysics (Netherlands), vol.93, no.3-4, p.207-23 (1983).

Published values of body-wave magnitude m_b , surface-wave magnitude, M_s , and seismic moment, M_0 , for mid-plate and plate-margin earthquakes, are analyzed, to determine their inter-relationship and to develop scaling laws for earthquake spectra. All of the plate-margin earthquakes used in the study occurred near the border of the Pacific Ocean. The mid-plate earthquakes occurred in both continental plate interiors and oceanic plate interiors. The relations studied include, m_b - M_s , m_b - M_0 and M_s - M_0 .

64054 Characteristics of multiple shocks: wave pattern, extent and orientation of focal regions. I.V.Gorbulova (Inst. of Phys. of the Earth, Moscow, USSR).

Tectonophysics (Netherlands), vol.93, no.3-4, p.225-32 (1983).

A new approach to the interpretation of P and S waves, whereby the temporal process of radiation of multiple shock waves is taken into account, is suggested.

64055 Magnitudes of New Zealand earthquakes: a comparison of magnitudes calculated by different methods. A.J.Haines (Seismological Obs., Wellington, New Zealand).

Tectonophysics (Netherlands), vol.93, no.3-4, p.245-8 (1983).

Before the introduction in 1977 of new procedures for calculating the local magnitudes of New Zealand earthquakes, these were calculated using a derivative of Richter's method for Southern California. There are systematic differences between the magnitudes calculated by the two methods which are functions of position, magnitude and the types of seismometer recording the event. Usually the difference is small, though, for large earthquakes in particular, it can be close to unity. Differences of order unity are often observed between m_b values reported by the ISC and both sets of local magnitudes. There appears to be no relationship between the local magnitudes, which now allow for the nature of wave propagation below New Zealand, and those reported by the ISC.

64056 Regional relationships among earthquake magnitude scales.

D.H.Chung, D.L.Bernreuter (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).

Tectonophysics (Netherlands), vol.93, no.3-4, p.249-50 (1983).

Various magnitude scales commonly used and the interrelationships among them are reviewed. It is shown that problems exist with all of the magnitude scales being used in the United States. When using regional catalogs, for example, it is often necessary to determine how the reported magnitudes were determined. Often such information is not available, although the potential errors are quite large.

64057 Determination of spectral properties of earthquakes from their magnitudes. R.Nortmann, S.J.Duda (Inst. fur Geophys., Univ. Hamburg, Hamburg, Germany).

Tectonophysics (Netherlands), vol.93, no.3-4, p.251-75 (1983).

Following the recommendation of the 'IASPEI Commission on Magnitudes' from 1967, P-wave magnitudes of distant earthquakes are being computed with the aid of the calibration functions of Gutenberg and Richter (1956). With the development of the instrumental seismology, especially in view of the availability of broad-band recordings, the question arises whether the functions are still adequate. In this investigation new calibration functions for P- and S-waves are presented, which are not only dependent on epicentral distance and focal depth, but also on the period of the spectral component of the wave. The determination of calibration functions is based on the currently most plausible global models for the velocity and anelasticity distribution. Taking into account the effective bandwidth of the instruments employed, eventually leads to the so-called spectral magnitudes. From the spectral magnitudes $m(T)$, the energy density spectrum $E(T)$ of the respective wave can readily be computed. The corresponding formula is $E(T) = 10^{2m(T)-1.4}$, with $E(T)$ in joules per hertz.

64058 Amplitude-periodband diagrams and amplitude spectra of teleseismic body waves. A.Plesinger, J.Vanek, C.Sobotova (Geophys. Inst., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).

Tectonophysics (Netherlands), vol.93, no.3-4, p.277-88 (1983).

The relation between amplitude-periodband (APB) diagrams and Fourier spectra of teleseismic P- and S-waves was analyzed using displacement-proportional signals derived from magnetic tape records of the feedback-controlled broadband velocigraph operating at the KHC seismic station. Most Fourier spectra and all the APB diagrams of the wave groups investigated exhibit a more or less pronounced maximum and do not correspond to the shape of theoretical far-field spectra for the Brune model. Contrary to Fourier spectra, APB diagrams have an unambiguously defined level and are not influenced by truncation, incorrect zero level and other disturbing effects.

64059 Determination of a magnitude calibration function using short-period readings of PKP. G.Kowalle (Central Inst. for Phys. of the Earth, Acad. of Sci., Potsdam, Germany), B.Tittel, P.Bornmann.

Tectonophysics (Netherlands), vol.93, no.3-4, p.289-94 (1983).

On the basis of PKP-readings of the seismological station network of the GDR magnitude calibration functions were derived. Since 1975 one of these calibration functions for distances $D > 145^\circ$ is routinely used for magnitude determination at Collm-Station. Deviations from the m_b -values published by the World Date Centres are normally not larger than 0.2 magnitude units. For the distance range from 110° to 165° another calibration function was determined on the basis of USGS-data. Significant regional differences were found for calibration functions for several subduction zones, possibly indicating differences in the elastic properties and structure of the upper mantle in these regions.

64060 Normal, blue and red earthquakes—a new way of earthquake classification on the basis of body-wave magnitudes. S.J.Duda, R.Nortmann (Inst. fur Geophys., Univ. Hamburg, Hamburg, Germany).

Tectonophysics (Netherlands), vol.93, no.3-4, p.295-306 (1983).

Monochromatic magnitudes, based on P- and on S-waves, provide a means to recognize differences in the spectral contents of body-waves radiated from earthquake foci. New, synthetic magnitude calibration functions taking into account periods of waves recorded, improve the consistency of magnitude figures assigned routinely to earthquakes. First results of a world-wide regionalization of earthquakes according to their spectral character are presented. The preponderance of short-period radiation in one class of earthquakes, and of long-period radiation in another is seen.

64061 Relationships among the source parameters of earthquakes in Europe. D.Prochazkova (Geophys. Inst., Czechoslovak Acad. of Sci., Prague, Czechoslovakia).

Tectonophysics (Netherlands), vol.93, no.3-4, p.307-11 (1983).

Earthquake source parameters such as the seismic moment, the source dimension, the stress drop, the average of the relative displacement of the two sides of a fault, the seismic energy, etc. can serve as an important data base for describing the source and the seismic regime of the individual focal regions. These source parameters were calculated on the assumption that the mechanism of earthquakes can be described by a double couple, and taking into account the conclusions from the workshop of the ESC-Subcommission on Focal Mechanism in Budapest 1980 (Udias, 1980).

64062 Considerations for the body-wave magnitude determination in the Recent Earthquake Data Report of the United States Geological Survey. S.Miyamura (Oki Electric Industry Co. Ltd., Tokyo, Japan).

Tectonophysics (Netherlands), vol.93, no.3-4, p.313-18 (1983).

Discusses the implications of including m_b -determinations with periods longer than 2 or 3 seconds in the Recent Earthquake Data Reports (EDR) of the US Geological Survey. Previously these longer periods were not included. (1 ref.)

64063 Seismic triggering effect of tidal stress. Ding Zhong-Yi, Jia Jin-Kang, Wang Ren (Dept. of Geology, Peking Univ., Peking, China).

Tectonophysics (Netherlands), vol.93, no.3-4, p.319-35 (1983).

The tidal stress field of a layered, spherically symmetric Earth due to the Sun and Moon is used to investigate its relationship to the occurrence of earthquakes. For 70 severe earthquakes which occurred in or near China during the last 24 years, the tidal stress was calculated in spherical polar coordinates at the focus at the time of occurrence. The normal and tangential stress components along the slip direction on the earthquake fault plane were then found by a coordinate transformation. Coulomb's criterion of shear fracture is used to determine whether these stress components will trigger the earthquakes or not. The results show that of the 70 earthquakes, 43 have been subjected to a triggering effect and for the 18 events that occurred in north China, 14 have been triggered. It may be concluded that for shallow strike-slip earthquakes there is a significant triggering effect, while for oblique-slip and dip-slip earthquakes the tidal stress has only a small triggering effect.

64064 Spectra of the earthquake sequence February-March, 1981, in south-central Sweden. O.Kulhanek, T.Van Eck, N.John, K.Meyer, R.Wahlstrom (Seismological Dept., Uppsala Univ., Uppsala, Sweden).

Tectonophysics (Netherlands), vol.93, no.3-4, p.337-50 (1983).

On February 13, 1981 a relatively strong earthquake occurred in the Lake Van region in south-central Sweden. The shock had a magnitude of $M_L = 3.3$ and was followed within three weeks by three aftershocks, with magnitudes $0.5 \leq M_L \leq 1.0$. The focal mechanism solution of the main shock indicates reverse faulting with a strike in the N-S or NE-SW direction and a nearly horizontal compressional stress. The aftershocks were too small to yield data for a full mechanism solution, but first motions of P-waves, recorded at two stations, are consistent for the aftershocks. Dynamic source parameters, derived from Pg- and Sg-wave spectra, show similar stress drops for the main shock (2 bar) and the aftershocks (1 bar), while the differences in seismic

moment ($1.5 \cdot 10^{20}$ resp. $4 \cdot 10^{18}$ dyne cm), fault length (0.7 resp. 0.2 km) and relative displacement (0.15 resp. 0.03 cm) are significant.

64065 The spatial distribution of earthquakes, focal mechanism solutions, and subducted lithosphere in the Philippine and northeastern Indonesian Islands. R.K. Cardwell, B.L. Sacks, D.E. Karig (Dept. of Geological Sci., Cornell Univ., Ithaca, NY, USA).

In book: *Tectonic and geologic evolution of southeast Asian seas and islands*, D.E. Hayes [Ed.], p.1-35. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

The spatial distribution of earthquake hypocenters and earthquake focal mechanism solutions is used to estimate the three-dimensional configuration of lithosphere that is subducted beneath the Philippine and northeastern Indonesian islands and to estimate the geometry and nature of plate boundaries in the region. The data set consists of well-located hypocenters selected from seismological bulletins. Focal mechanism solutions for 134 earthquakes, including 68 new solutions, are correlated with tectonic features of the region. The Philippine region consists of an aggregate of island arcs lying between the Philippine Sea Plate and the Southeast Asian Plate. Convergence between the Philippine Islands and the eastern boundary of the Southeast Asian Plate appears to have occurred along the Manila Trench, Negros Trench, and Cotabato Trench. The lithosphere of the Celebes Basin has also been subducted along the western portion of the North Sulawesi Trench to a depth of over 200 km beneath the north arm of Sulawesi. Convergence between the Philippine Islands and the western boundary of the Philippine Sea Plate occurs along the East Luzon Trough and the Philippine Trench. (66 refs.)

64066 The nature of seismicity patterns before large earthquakes. H. Kanamori (Seismological Lab., California Inst. of Technol., Pasadena, CA, USA).

Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.1-19

Various seismicity patterns before major earthquakes have been reported in the literature. Although many earthquakes are preceded by all, or some, of these patterns, their detail differs significantly from event to event. In order to examine the details of seismicity patterns on as uniform a basis as possible, the author makes space-time plots of seismicity for many large earthquakes by using the NOAA and JMA catalogs. Among various seismicity patterns, preseismic quiescence appears most common, the case for the 1978 Oaxaca earthquake being the most prominent. Although the nature of other patterns varies from event to event, a common physical mechanism may be responsible for these patterns; details of the pattern are probably controlled by the tectonic environment and the heterogeneity of the fault plane. A simple asperity model is introduced to explain these seismicity patterns. (76 refs.)

64067 Precursory seismicity patterns: stalking the mature seismic gap. R.E. Habermann (Cooperative Inst. for Res. in Environmental Sci., Univ. of Colorado, Boulder, CO, USA).

Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.29-42

Mature seismic gaps are defined as gaps in which a possible precursor has been identified. The seismic gap hypothesis by itself provides an excellent means of narrowing spatial limits along plate boundaries within which the great earth quakes of the next several decades are expected. Seismicity rates measured teleseismically are tested as a possible indicator of maturity in the regions of eleven recent large events. (33 refs.)

64068 Seismicity and tectonics of the central New Hebrides island arc. B.L. Sacks, R.K. Cardwell (Dept. of Geological Sci., Cornell Univ., Ithaca, NY, USA), J.-L. Chatelain, M. Barazang, J.-M. Marthelot, D. Chinn, R. Louat. Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.93-116

The seismicity of the central New Hebrides convergent plate boundary is investigated with three sets of data: (1) large earthquakes ($M_s > 6.9$) for the past 75 years, (2) moderate-sized earthquakes ($m_b = 4.5$ and $M_s < 7.0$) during the past 20 years, and (3) small earthquakes ($m_b = 2.5$ to 4.5) located by local networks for several intervals of 1-2 months each since 1975 and continuously since mid-1978. Tectonic features are also discussed. (67 refs.)

64069 The 1906 San Francisco earthquake and the seismic cycle. W.L. Ellsworth, A.G. Lindh, W.H. Prescott, D.G. Herd (US Geological Survey, Menlo Park, CA, USA).

Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.126-40

The cyclic nature of strain accumulation and release in great earthquakes on the San Andreas fault appears to have modulated the historic pattern of seismicity in northern coastal California. Fedotov (1968) and Mogi (1968) recognized a similar seismic cycle accompanying great earthquakes in the subduction zones of the Western Pacific. The cycle consists of an extended period of quiescence after a major earthquake, followed by a period of increased activity that leads to the cycle-controlling earthquake and its fore-shocks and aftershocks. The reemergence of $M \geq 5$ earthquakes since 1955 within the latitudes of the 1906 surface rupture to the north of San Jose, after an extended period of quiescence following 1906, lead the authors to conclude that the region is entering the active stage of the cycle. (53 refs.)

64070 Earthquake hazard in the Hellenic Arc. M. Wyss (Dept. of Geological Sci., Univ. of Colorado, Boulder, CO, USA), M. Baer.

Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.153-72

The seismicity of the Hellenic arc is studied as a function of space and time by two methods. Firstly, data on large and great historic earthquakes are reinterpreted with the purpose of identifying seismic gaps along this plate boundary. The authors that the 8 great and 3 large earthquakes which occurred along the Hellenic arc between 1805 and 1926 can be interpreted as shallow sources along the plate boundary. Based on macroseismic data the authors propose approximate locations and size of these earthquakes. It appears that the entire Hellenic plate boundary can be considered to be a seismic gap of class 1, 2, and 3 depending on the segment. Secondly, a systematic analysis of the shallow seismicity (< 100 km) showed that the rate decreased by about 80% in the western third and portions of the eastern third of the arc. Combining the seismic gap and the seismicity rate data suggest that ruptures of about 120 ± 40 km lengths ($M = 7.3/4 \pm 1/2$) may be expected to occur along the Hellenic plate boundary near 22.5 to 23.5° E and 26.5 to 27.5° E between now (1983) and 1990. (49 refs.)

64071 A review of geological evidence for recurrence times of large earthquakes. K.E. Sieh (Div. of Geological & Planetary Sci., California Inst. of Technol., Pasadena, CA, USA).

Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.181-207

The geological record of the past several thousand years contains valuable information for evaluating the earthquake potential of the Earth's major fault systems. Geologists have begun to characterize past and, presumably, future behavior of active faults and recurrence intervals for large earthquakes by studying 1) uplifted marine terraces, 2) fault-scarp morphology, 3) physiographic features offset along faults, and 4) faulted or otherwise deformed young sediments. (97 refs.)

64072 Repeat time of great earthquakes along simple plate boundaries. L.R. Sykes, R.C. Quittmeyer (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).

Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.217-47

Repeat times of large earthquakes are obtained for 12 segments of simple plate boundaries of the convergent type and three of the transform type for which two or more large shocks are known to have occurred at nearly the same place. Repeat time is related not only to the relative plate velocity but also to the geometry of the rupture zone. The data support the time-predictable model wherein the time interval between two large shocks is proportional to the displacement in the preceding event. When the time interval between two previous large shocks in an area is known and the ratio of their displacements can be determined, the time interval between the last large shock and a future earthquake can be estimated with much greater accuracy. An application of this calibrating technique to six regions in which three or more shocks are known to have occurred is presented. (100 refs.)

64073 Great detachment earthquakes along the Himalayan Arc and long-term forecasting. L. Seeber, J.G. Armbruster (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).

Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.259-77

Examines the surface effects of great Himalayan earthquakes, and infers the extent of the associated ruptures. Some spatial and temporal constraints on the next great earthquakes are to be inferred from the reconstruction in space and time of the previous ruptures. The tectonic model is discussed. (73 refs.)

64074 Specification of a soon-to-occur seismic faulting in the Tokai District, central Japan, based upon seismotectonics. K. Ishibashi (Internat. Inst. of Seismology & Earthquake Engng., Ibaraki, Japan).

Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.297-332

The 'Tokai earthquake' expected in the Tokai district, the Philippine Sea coast of central Japan, is the most important target now in the Japanese earthquake prediction program. Its long- and short- prediction efforts are among the most advanced cases in the world. The author reviews in detail the long-term prediction research of this earthquake and presents the most probable fault model. The expected event is considered an interplate earthquake due to the underthrusting of the Philippine Sea plate beneath southwest Japan at the Nankai-Suruga trough. (165 refs.)

64075 Long- and intermediate-term seismic precursors to earthquakes—state of the art. M. Reyners (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).

Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.333-47

Rikitake [1975, 1979] has made a thorough classification of earthquake precursors, both seismic and nonseismic. The author concentrates on research carried out since 1977, with special reference to false alarms and negative results. (113 refs.)

64076 Crustal deformation studies and earthquake prediction research. W. Thatcher (US Geological Survey, Menlo Park, CA, USA).

Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.394-410

Geodetic measurements have diverse applications in studies related to earthquake hazard mitigation and prediction. The author considers three areas where such measurements are particularly useful: first, in the assessment of long-term earthquake hazard; secondly, in monitoring for possible precursory crustal deformation; and thirdly, in constraining the mechanism of stress build up and release in the brittle crust. (48 refs.)

64077 Neotectonic deformation, near-surface movements and systematic errors in US leveling measurements: implications for earthquake prediction. R. Reilinger, L. Brown (Dept. of Geological Sci., Cornell Univ., Ithaca, NY, USA).

Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.422-40

Reviews some factors that must be considered when attempting to extract tectonic information, especially those relevant to earthquake prediction, from historic leveling observations. Evidence on the extent and nature of systematic errors nontectonic movements, and tectonic deformation (both earthquake related deformation and tectonic movements unassociated with earthquakes) from US leveling measurements is presented. Specific criteria to help recognize suspect movements are developed and illustrated by application to a reevaluation of certain southern California leveling results of particular interest in earthquake prediction. (51 refs.)

64078 A preliminary analysis of reported changes in ground water and anomalous animal behavior before the 4 February 1975 Haicheng earthquake. D. Qidong, J. Pu (Inst. of Geology, State Seismology Bur., Beijing, China), L.M. Jones, P. Molnar.

Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.543-65

Examines the spatial and temporal distributions of some 570 reports of changes in ground water and 670 reports of anomalous animal behavior in the three months before the Haicheng earthquake (4 February 1975, $M = 7.3$). These changes and anomalies were reported from a very large area, extending more than 150 kilometers in nearly all directions from the epicenter with no concentration near it. There are suggestions (1) of correlations in time and space of the two types of anomalies with the ground water changes preceding the aberrant animal behavior by a day or two, (2) of a greater concentration of reports near major active faults than far away from them, and (3) of migrations in time of the area in which there were frequent observations. The

data suggest that some animals may have responded to a shaking of the ground due to foreshocks and others may have sensed changes in the ground water. (9 refs.)

91.35 EARTH'S INTERIOR STRUCTURE AND PROPERTIES

64079 Leg 82 of the International Program of Ocean Drilling (IPOD): normal or abnormal ocean crust on the Mid-Atlantic Ridge; Geochemical properties. H.Bougault (Centre Océanologique de Bretagne, Brest, France), S.Cande, W.Mills, D.Curtis, R.Neuser, D.Christie, M.Rideout, J.Etoubleau, N.Drake, J.Brannon, B.Weaver, D.Echols, M.Clark, J.M.Khan, I.Hill. *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.1, p.97-102 (10 Jan. 1983). In French.

On Leg 82, the Glomar Challenger sampled the Ocean crust at nine sites west and southwest of the Azores Triple Junction. Shipboard analysis for key trace elements showed that the relationship between chemical characteristics of basalts and geodynamics are not as simple as predicted by some pre-cruise hypotheses. Preliminary results (example: enriched basalts and depleted basalts recovered in the same hole) allow the prediction that onshore studies (example: isotopes of Sr, Nd and Pd) will provide important information for fundamental geochemistry, magmatic processes and mantle heterogeneity. Additional highlights were the discovery of serpentinite and altered gabbro at three sites at shallow depth; the recovery of an almost complete sediment section from Oligocene through early Pleistocene; the discovery of sea-water underpressure in the basement 35 My old. (17 refs.)

64080 **Io-U dates of a coral formation from the last interglacial age on the Brazilian coast. Use of ^{232}Th as a tracer.** M.Bernat (Univ. de Nice, Nice, France), L.Martin, A.Bittencourt, G.V.Boas. *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.3, p.197-200 (24 Jan. 1983). In French.

Four coral samples taken in a quarry near the town of Ilheus (Bahia State, Brazil) analyzed by an α spectrometry method for ^{230}Th and uranium isotopes (using ^{229}Th and ^{232}U as tracers) gave a mean age of 123500 years. These first dates confirm the general stability of the Atlantic coast since that time. (13 refs.)

64081 **A reference section of the oceanic crust: leg 83 of the International Program of Ocean Drilling (IPOD) near the Costa Rica rift, eastern Pacific Ocean.** R.N.Anderson (Lamont-Doherty Geological Obs., Palisades, NY, USA), J.Honnorez, C.Laverne. *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.4, p.281-6 (31 Jan. 1983). In French.

Drilling during IPOD leg 83 has established the most complete reference section to date through the upper oceanic crust. For the first time, a drilling has reached the dike-zone and metamorphosed basalt. (7 refs.)

64082 **Gneissic intercalations within a tectonic unit from the Piedmont Ophiolite Nappe in the Western Alps: Record of a subducted continental margin?** U.Pognante. *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.5, p.379-82 (7 Feb. 1983). In French.

A tectonic unit from the Piedmont Ophiolite Nappe is distinguished by the association of calc-schists (schistes lustrés) with albite gneiss of continental origin and with manganese-rich quartzites. This association and the Alpine H.P. evolution suggest that the unit described represents the product of large scale transpositions in subduction environment of a part of the thinned apulian (?) continental margin bordering the Piedmont-Ligurian ocean basin. (10 refs.)

64083 **The allochthony of the 'Zone des Diapirs' in Northern Tunisia.** V.Perthuisot, H.Rouvier (Ecole Normale Supérieure Lab. Geologie, Paris, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.5, p.393-6 (7 Feb. 1983). In French.

It is impossible to accept the allochthony of the whole diapir zone and the recent age of the Triassic extrusions. The ancient and permanent connections between each diapir and its sedimentary surroundings are proved by field evidence and confirm the ante-alpin age of the most extrusive structures. (16 refs.)

64084 **Discovery of a new nappe from the north-east in the Parnassus zone (Greece).** P.-J.Combes (Univ. des Sci. et. Tech. du Languedoc, Montpellier, France). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.5, p.397-400 (7 Feb. 1983). In French.

An important klippe between Arachova and Davlia belongs to a thrust sheet coming from the northern Parnassus margin, south of Tithorea. This was probably drawn to the Parnassian substratum when the pelagonian nappe overthrust, but only after the beotian nappe appeared. Later a transverse sinistral fault with the uplift of the septentrional region induced the Arachova klippe break-down and its translation to the east. (7 refs.)

64085 **A seismic refraction line along the axis of the southern Piedmont and crustal thicknesses in the southeastern United States.** A.E.Kean, L.T.Long (School of Geophys. Sci., Georgia Inst. of Technol., Atlanta, GA, USA).

Earthquake Not. (USA), vol.51, no.4, p.3-13 (Oct.-Dec. 1980). [received: April 1983]

Arrival times of Pn and Sn phases from southeastern United States earthquakes listed in the Earthquake Data Reports from July 1970 to June 1977 show a scatter of 2 seconds. In contrast, the Pq phase arrivals show a scatter of only 0.5 seconds. The difference in scatter was interpreted as indicating variation in the depth to the Moho. In order to evaluate Moho depths, a detailed refraction line and crustal model were developed along the axis of the Southern Piedmont Province from central Georgia across South Carolina.

Accurately located recent earthquakes and explosions occurring and recorded along the axis of the Southern Piedmont Province were used to define the travel time curves. Crustal thicknesses in the southeastern United States are computed from Pn-Pg times by comparison to the Southern Piedmont crustal model. Moho depths were measured for the mountains of north Georgia, eastern Tennessee and western North Carolina. (9 refs.)

64086 **Uranium disequilibrium dating of phosphate deposits from the Lau Group, Fiji.** K.K.Roe, W.C.Burnett (Dept. of Oceanography, Florida State Univ., Tallahassee, FL, USA), A.I.N.Lee. *Nature (GB)*, vol.302, no.5909, p.603-6 (14 April 1983).

Uranium-series methods of absolute age determinations were first applied to fossil coral reefs and more recently to fossil bone, marine apatite and insular apatite. Past sea level stands, climatic conditions, primary productivity, and other factors are thought to be influential in the deposition of avian guano and subsequent insular phosphorite formation. Some deposits appear to have formed during high stands of the sea while others may be related to glacial epochs. The authors report an attempt to determine the absolute age of two phosphate deposits in the Lau Group, Fiji, by uranium-series disequilibrium techniques, in order to assist in the evaluation of their origin in terms of known palaeoclimatic information. (28 refs.)

64087 **Rates of sedimentation, and stratigraphical completeness.** J.C.Tipper (Dept. of Geology, Univ. College Galway, Galway, Ireland). *Nature (GB)*, vol.302, no.5910, p.696-8 (21 April 1983).

The most obvious result of sedimentation processes is the change in the thickness of accumulated sediment with time. Whenever the net change over a period of time is positive, a record is left of a sedimentation system's existence, a stratigraphical section. For the stratigrapher, the problem that such a section poses is to determine the detailed correspondence of thickness to time: for the sedimentologist, the problem is to infer the nature of the parent sedimentation system, and to estimate its parameters. A simple stochastic model is used to: (1) illustrate some basic stratigraphical results of elastic sedimentation processes; (2) offer an explanation for the commonly cited systematic decrease of mean sedimentation rate with increasing time span; and (3) assess the concept of stratigraphical completeness. (8 refs.)

64088 **Noble gas constraints on the layered structure of the mantle.**

I.Kaneoka (Geophys. Inst., Univ. of Tokyo, Tokyo, Japan).

Nature (GB), vol.302, no.5910, p.698-700 (21 April 1983).

Several chemical models of mantle structure have been proposed based on isotopic data such as Sr, Nd, Hf and Pb in volcanic rocks from both oceanic and continental areas. The most popular of these are two chemical models of the vertically-layered mantle: (1) that it is a depleted mantle from which mid-oceanic ridge basalt (MORB) is derived and (2) that it is a fertile mantle from which a mantle plume may arise. However, these models are almost always based on solid elements, such as Sr, Nd, Hf and Pb isotopes, and do not fully reflect the noble gas data. Because noble gases are liable to be lost from the solid Earth when a mantle differentiation occurs on a global scale in the upper mantle, the data on noble gas isotopes could give constraints on the structure of the mantle that differ from those by solid element isotopes. Based on a consideration of $^3\text{He}/^4\text{He}$ and $^{40}\text{Ar}/^{36}\text{Ar}$ ratios of recent samples, the author argues that the observed data suggest that mixing occurs between the source materials of a mantle plume and of MORB. The data seem to favour the model which assumes that the source of a typical mantle plume is deeper than that of MORB. (15 refs.)

64089 **Mantle eclogite and carbonate as sources of sodic carbonatites and alkalic magmas.** A.H.Treiman, E.J.Essene (Dept. of Geological Sci., Univ. of Michigan, Ann Arbor, MI, USA).

Nature (GB), vol.302, no.5910, p.700-3 (21 April 1983).

At mantle pressures, partial melts of peridotite + CO_2 are carbonate-rich, but contain insufficient sodium to form most carbonatites and associated silicate magmas. A possible source rock is eclogite, and extrapolations from experiments suggest that eclogite + CO_2 will coexist with melt along geotherms of low heat flow. Thermochemical calculations yield high carbonate activities, and imply that the melt is carbonatitic. The melt can be modelled in the system jadeite-calcite- CO_2 and will, on emplacement, form mineral assemblages characteristic of a wide range of alkalic rocks. The tectonic settings of carbonatites are consistent with an origin as partial melts of eclogite + carbonate + CO_2 under areas of low surface heat flow, and suggest that carbonatite emplacement is not related to mantle hotspots. (39 refs.)

64090 **A geophysical approach to the granite batholith under the eastern Southern Uplands, Scotland.** E.Lagios (Seismological Lab., Athens Univ., Athens, Greece), R.G.Hipkin.

Pure & Appl. Geophys. (Switzerland), vol.120, no.2, p.375-88 (1982).

From interpretation of the Bouguer gravity and aeromagnetic anomalies in south-east Scotland it is concluded that a massive granite batholith underlies the greater part of the eastern Southern Uplands. The granite model which was computed earlier from gravity anomalies in the Tweeddale area fits the observed magnetic anomalies closely, if a normal magnetization of 0.095 A m^{-1} is assigned, similar to values found for exposed local granites. Further gravity modelling shows that, apart from the Tweeddale Lammermuir Fault. A model for the East Lothian volcanics was computed from their electromagnetic anomalies, then their gravitational effect was combined with that estimated for the Devonian and Carboniferous sediments and the result stripped off the observed gravity field. The residual gravity anomalies were used to generate a two-dimensional model for the granite north of the Lammermuir Fault. The expected tectonic consequences of a massive granite batholith in the eastern Southern Uplands are studied. (21 refs.)

64091 **The lithosphere in the Central-eastern Mediterranean area.** G.Calcagnile (Istituto di Geodesia e Geofisica, Univ. di Bari, Bari, Italy), F.D'Ingo, P.Farrugia, G.F.Panza.

Pure & Appl. Geophys. (Switzerland), vol.120, no.2, p.389-406 (1982).

The lithosphere beneath the central-eastern Mediterranean area has been investigated by inversion of the regional dispersion relations derived from analysis of surface waves. It is possible to distinguish several types of crust with average S-wave velocities in the range 3.0-3.8 km/sec, and thicknesses varying from a minimum of about 30 km, which corresponds to the Apennines, Crete and Otranto Channel regions, to a maximum of about 51 km beneath the Ionian Sea, which can be considered as a submerged continent. Associated with these crustal features, large lateral variations have been detected in the lithosphere thickness which varies from a minimum of about 30 km corresponding to the Tyrrhenian Sea and south of Crete to a maximum of about 130 km corresponding to south-eastern Alps and north-central Greece, while the sub-Moho S-wave velocity varies in the range 4.2-4.8 km/sec. The constraint furnished by the results to the geological-tectonic setting of the investigated area, characterized by the continent-continent collision between Africa and Europe, is pointed out. (46 refs.)

64092 Primitive helium in diamonds. M.Ozima, S.Zashu (Univ. of Tokyo, Tokyo, Japan).

Science (USA), vol.219, no.4588, p.1067-8 (4 March 1983).

Thirteen diamond stones from various unspecified mines in South Africa were analyzed for the isotopic ratio of helium-3 to helium-4. Values of the ratio ranged from less than 10^{-7} to $(3.2 \pm 0.25) \times 10^{-4}$. The latter value is higher than the primordial helium-3/helium-4 ratio meteorites and close to the ratio for the solar-type helium. Such extremely high values may represent primitive helium that evolved very little (that is, showed very little increase in radiogenic helium-4) since the formation of the Earth. (9 refs.)

64093 Timing and chemistry of igneous events associated with the Southern Oklahoma Aulacogen. M.C.Gilbert (Dept. of Geological Sci., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).

Tectonophysics (Netherlands), vol.94, no.1-4, p.439-55 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).

Igneous activity in the Southern Oklahoma Aulacogen of North America was concentrated in the early rifting stages of aulacogen development. The time span over which liquids rose may not have exceeded 50 m.y. and certainly terminated before the Upper Cambrian. Igneous activity began with three basaltic liquids, stratigraphically identifiable but perhaps not all distinct genetically. This was followed by one large rhyolitic-granite episode of A-type character. One final basaltic event ended the activity. All the basaltic types seem to be tholeiitic showing more kinship with either the older, Proterozoic North American Midcontinental Rift or the northern part of the Cenozoic Rio Grande Rift, than the Cenozoic East African Rift. Two major uplifts occurred: one between the earlier basalts and the rhyolite, and one much later, after all igneous activity was over, in the Pennsylvanian.

64094 The Morton-Black hypothesis for the thinning of continental crust—revisited in western Afar. P.Mohr (Dept. of Geology, Univ. Coll., Galway, Ireland).

Tectonophysics (Netherlands), vol.94, no.1-4, p.509-28 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).

Geological observations along the western margin of Afar show that the Morton-Black model, in which thinning of upper continental crust at a nascent continental margin is accomplished through block faulting and tilting, is not wholly applicable. Rather, dikes are concentrated into swarms, suggestive of important direct dilatation. Faults are concentrated into sets, within which no block-tilting steeper than 45° is observed. Therefore attenuation of the Afar margins requires a significant role for processes other than block tilting, and in some margin sectors the transition from continental to neo-oceanic crust may be relatively abrupt.

64095 Accumulation of fossil fuels and metallic minerals in active and ancient rift lakes. E.I.Robbins (US Geological Survey, Reston, VA, USA).

Tectonophysics (Netherlands), vol.94, no.1-4, p.633-58 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).

A study of active and ancient rift systems around the world suggests that accumulations of fossil fuels and metallic minerals are related to the interactions of processes that form rift valleys with those that take place in and around rift lakes. The deposition of the precursors of petroleum, gas, oil shale, coal, phosphate, barite, Cu-Pb-Zn sulfides, and uranium begins with erosion of uplifted areas, and the consequent input of abundant nutrients and solute load into swamps and tectonic lakes. Hot springs and volcanism add other nutrients and solutes. The resulting high biological productivity creates oxidized/reduced interfaces, and anoxic and H_2S -rich bottom waters which preserves metal-bearing organic tissues and horizons. Postdepositional processes in rifts include high heat flow and a resulting concentration of the organic and metallic components that were dispersed throughout the lakebeds. Postdepositional faulting brings organic- and metal-rich sourcebeds in contact with coarse-grained host and reservoir rocks. A suite of potentially economic deposits is therefore a characteristic of rift valleys.

64096 Geothermal resources of rifts: a comparison of the Rio Grande Rift and the Salton Trough. C.A.Swanberg (Teledyne Geotech. Garland, TX, USA).

Tectonophysics (Netherlands), vol.94, no.1-4, p.659-78 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).

The Rio Grand Rift and the Salton Trough are the best developed rift systems in the United States and both share many features common to rifts in general, including geothermal resources. These two first have different tectonic and magmatic histories, however, and these differences are reflected in the nature of their geothermal resources. The Salton Trough is a well developed and successful rift. Quaternary silicic magmatization has occurred and several of the geothermal resources are associated with recent rhyolitic intrusions. Localized upper crustal melting is a distinct possibility and there is increasing speculation that very high temperature ($>300^\circ\text{C}$) geothermal fluids may underlie a large portion of the central trough at depths in excess of 4 km. Low temperature geothermal resources associated with shallow hydrothermal convection are less common. In contrast, the Rio Grande Rift is less well developed. The geothermal resources within the Rio Grande Rift do not correlate well with these young basalts. Rather, the quality of geothermal resources are low temperature ($<100^\circ\text{C}$) and result from forced hydrothermal convection which discharges at constrictions within or at the end of the major sedimentary basins. High temperature resources are less common.

64097 Crustal structure of the Molucca Sea collision zone, Indonesia. R.McCaffrey, E.A.Silver (Earth Sci. Board, Univ. of California, Santa Cruz, CA, USA), R.W.Raitt.

In book: *Tectonic and geologic evolution of southeast asian seas and islands*, D.E.Hayes [Ed.], p.161-77. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

Seismic refraction profiles run within the Molucca Sea of eastern Indonesia reveal a thick, low-velocity layer (collision complex) which is inferred to be the source of the large negative free air gravity values associated with this arc-arc collision zone. Thicknesses of low-density material of up to 15 km beneath 2 km of water can account for the free air gravity anomaly, which reaches values as low as -230 mGal. Complex travel time curves and high seismic attenuation are characteristic of refraction profiles run within the Molucca Sea collision complex. The collision complex can be interpreted as being composed of two distinct constant velocity layers. The overall similarity between travel time curves coupled with anomalous travel times on the scale of a few kilometers suggests the internal structure of the collision complex to be that of blocks with dimensions of the order of several tens of kilometers embedded in a deformed matrix showing a continuous and nearly linear increase in compressional velocity with depth. (27 refs.)

64098 Crustal structure across the Mariana island arc. S.L.LaTraille, D.M.Hussong (Inst. of Geophys., Univ. of Hawaii, Honolulu, HI, USA).

In book: *Tectonic and geologic evolution of southeast asian seas and islands*, D.E.Hayes [Ed.], p.209-21. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

Crustal structure across the Mariana island arc system from the Pacific plate to the Mariana Trough has been determined from 26 explosion seismic refraction profiles along a 750-km east-west line at 18°N latitude. In the northern Mariana Basin, old Pacific plate crust east of the Mariana Trench has an average thickness of 7 km, but unusually thick layers have seismic velocities of 3.1-4.3 and 5.3-5.9 km/s. The thick upper layers with low seismic velocities may be a result of midplate seamount volcanism related to the nearby Magellan seamounts. On the western side of the trench, thick sequences of low-velocity fore arc material (3.3-4.3 km/s) are found. The uppermost sediments decrease in thickness toward the trench, whereas underlying rocks with velocities between 3.5 and 5.8 km/s increase in thickness toward the trench. A relatively continuous layer with velocities from 6.1 to 6.5 km/s occurs across the entire fore arc at a depth of about 7 km. Moho velocities were not detected beneath the fore arc. In the Mariana Trough, an actively extensional back arc basin, the crust is laterally heterogeneous but in general has low seismic velocities and an average total thickness of only about 5 km. The crust may thin toward the center of the basin, where attenuation of seismic energy increases. The young back arc basin crust has seismic velocity structure similar to that found in slow-spreading midoceanic ridges. (32 refs.)

64099 1980 update of heat flow in the east and southeast Asian seas. R.N.Anderson (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).

In book: *Tectonic and geologic evolution of southeast asian seas and islands*, D.E.Hayes [Ed.], p.319-26. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

Heat flow in the marginal basins of east and southeast Asia either agrees with heat predicted for the basin's age from lithospheric cooling plate models or is highly variable (order-of-magnitude variations over tens of kilometers). However, marginal basins do have large depth versus age discrepancies in comparison to those of midoceanic ridge-generated lithosphere. Thus this elevation difference must be caused not by thermal contrasts but by dynamic or density variations unrelated to the geothermal structure of the lithosphere. Heat flow in the arc-trench gap is much more complex than was previously thought, the accretionary prism having low heat flow and the fore arc basin having considerably higher heat flow. (30 refs.)

91.40 VOLCANOLOGY

64100 Variations of the temperature, melt composition and water pressure during olivine crystallization in oceanic rocks from the Piton Fournaise volcano (Reunion Island, 1966 eruption). A.Sobolev (Acad. of Sci., Moscow, USSR), R.Clocchiatti, P.Dhamelincourt. *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.4, p.275-80 (31 Jan. 1983). In French.

An optical thermometry study of melt inclusions trapped in olivine phenocrysts obtained from the Piton Fournaise volcano shows that these minerals crystallized in the temperature range of 1240 to 1195°C \pm 10°C with a simultaneous change of the melt composition (MgO content from 9 to 7.6% wt). It is also noticed that the observed rise of the homogenization temperature with the duration of experiments and the simultaneous oxidation of the melt can be inferred as direct signs of water existence in the basalt system. Water occurrence in the CO₂ bearing coexisting fluid and melt inclusions was proved using a Raman laser microprobe. The spectra were obtained at a temperature near the critical point of H₂O and the p(H₂O)/p(CO₂) ratio was measured. (16 refs.)

64101 Surface deformation in volcanic rift zones. D.D.Pollard, P.T.Delaney, W.A.Duffield, E.T.Endo, A.T.Okamura (US Geological Survey, Menlo Park, CA, USA).

Tectonophysics (Netherlands), vol.94, no.1-4, p.541-84 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981). The principal conduits for magma transport within rift zones of basaltic volcanoes are steeply dipping dikes, some of which feed fissure eruptions. Elastic displacements accompanying a single dike-like emplacement elevate the flanks of the rift relative to a central depression. Concomitant normal faulting may transform the depression into a graben thus accentuating the topographic features of the rift. If eruption occurs the characteristic ridge-trough-ridge displacement profile changes to a single ridge, centered at the fissure, and the erupted lava alters the local topography. To investigate this process the authors compute the elastic displacements and stresses in a homogeneous, two-dimensional half-space driven by a pressurized crack that may breach the surface. A derivative graphical method permits one to estimate the three geometric parameters of the dike and the mechanical parameter from a smoothly varying displacement profile. Direct comparison of measured and theoretical profiles may be used to estimate these parameters even if inelastic deformation, notably normal faulting, creates discontinuities in the profile.

64102 The petrology and tectonics of Recent volcanism in the central Philippine Islands. A.F.Divis (Environmental Sci. Associates, Wheat Ridge, CO, USA).

In book: *Tectonic and geologic evolution of southeast asian seas and islands*, D.E.Hayes [Ed.], p.127-44. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

Recent volcanism in the central Philippines occurs along two principal north-south chains. The eastern Bicol chain probably results from subduction in shallow dipping zone associated with the Philippine Trench. An older, more steeply dipping zone tends northward from the Sulu (Sibutu-Basilan) arc to northwestern Luzon and has tholeiitic, calc-alkaline, and shoshonitic eruptive centers which may be the result of subduction in the Manila and Sulu trenches. The Bicol chain and the western Zambales-Zamboanga chain erupt lavas which are principally pyroxene-hornblende andesites. Phreatic eruptions of alkaline-andesite affinity occur along an east-west zone in central Luzon that may be a 'leaky transform fault' joining the most active portions of the Philippine and Manila Benioff zones. Systematic trace element variations within and between the Bicol and Zambales-Zamboanga volcanic arcs suggest an origin by partial melting of the subducted slab with secondary crustal contamination and crystal fractionation having only a minor role in magma evolution. A 'pseudoisochron' relationship between ⁸⁷Sr/⁸⁶Sr and ⁸⁷Rb/⁸⁶Sr yields an apparent age of approximately 51.8 m.y. It is inferred that this relation may be derived by sequential anatexis of mineral phases showing isotopic disequilibrium. Regional zonation of trace elements in lavas parallels that reported for subduction zone depth variation in porphyry copper, molybdenum, and tin deposits in southwestern North America and the Andes. (49 refs.)

64103 Geochemistry and K/Ar ages of volcanics dredged in the Philippine Sea (Mariana, Yap, and Palau Trenches and Parece Vela Basin). L.Becallava, G.Macciotta (Istituto di Petrografia, Univ. di Parma, Parma, Italy), C.Savelli, G.Serri, O.Zeda.

In book: *Tectonic and geologic evolution of southeast asian seas and islands*, D.E.Hayes [Ed.], p.247-68. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

Volcanic rocks dredged from inner and outer walls of the Mariana, Yap, and Palau trenches show different petrogenetic affinities related to different original tectonic settings. From the Pacific side of the trenches, either ocean floor tholeiites, generated at diverging plate margins, or ocean island tholeiites and alkali basalts, probably related to off-ridge volcanism, have been recovered. Dredge hauls from Yap and Palau near-shore trench walls yielded volcanic rocks belonging to island arc tholeiite and calc-alkalic series, respectively. From the near-shore slope of the Mariana Trench, in addition to island arc magmatic products (boninites, andesites, and low-Ti basalts), tholeiitic and transitional basalts possibly generated during interarc spreading were also found. The constant presence in the inner trench walls of island-arc-

interarc-derived products can be attributed to a progressive consumption, by subduction, of faulted blocks from the leading edge of the overriding island arc plate. From a general reconstruction of the volcanic events in the area it appears that the inception of interarc spreading for the Parece Vela Basin and Mariana Trough took place after the magmatic activity ceased in the respective remnant arcs and long before a new island arc volcanism started to the east. (102 refs.)

64104 Primitive arc volcanism and a boninite series: examples from Western Pacific island arcs. A.Meijer (Dept. of Geosci., Univ. of Arizona, Tucson, AZ, USA).

In book: *Tectonic and geologic evolution of southeast asian seas and islands*, D.E.Hayes [Ed.], p.269-82. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

Recent drilling, dredging, and field studies have delineated an unusual series of high Mg, low Ti lavas in several western Pacific island arcs. Included in this series are olivine-bronzite andesites long known as boninites. On the basis of their distinctive chemical characteristics, the high Mg, low Ti lavas are discussed as a separate magma series—the boninite series. Relative to the arc tholeiite series, rocks of the boninite series are enriched in refractory elements such as Mg, Ni, and Cr, are depleted in the high-field-strength ions Ti, Zr, Y, and rare-earth elements, and are generally higher in primary volatile contents. In the Mariana and Bonin arcs, Late Eocene to Oligocene boninite series lavas are invariably associated with older lavas of the arc tholeiite series. Field and laboratory studies suggest the arc tholeiite and boninite series magmas were derived from the mantle wedge overlying the Mariana-Bonin subduction zone. Melting of the wedge, driven by the introduction of a fluid phase exsolved from the subducted lithosphere, initially produced arc tholeiite series magmas and, later, less voluminous boninite series magmas. The production of boninite series magmas apparently requires unusually high geothermal gradients in the mantle overlying a subduction zone. (77 refs.)

91.45 PHYSICS OF PLATE TECTONICS

64105 Dating on the extensive tectonism in the North-Aegean region (Greece): palynologic data. N.Lyberis (Lab. de Geodynamique, Univ. Paris VI, Paris, France), J.Sauvage.

C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.1, p.107-10 (10 Jan. 1983). In French.

The North Aegean trough and the associated subsiding basins are the most relevant features of the North Aegean area. Their occurrence is due to an extensive tectonic phase posterior to the compressive phase of the Middle Miocene. Palynologic analysis of samples taken from two adjacent islands (Samos and Thasos) allow an upper Miocene age to be given for the opening of the North Aegean trough. (16 refs.)

64106 Prospect for numerical information on finite rock strain from the separation of magnetic anisotropy components. L.Daly, B.Henry (Lab. de Geomagnetisme, Saint-Maur, France).

C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.2, p.153-6 (17 Jan. 1983). In French.

A method permitting the separation of low field susceptibility anisotropies (i) from ferrimagnetics, and (ii) from the matrix, was proposed previously in the case where principal axes are identical. This method is extended to the general case. It consists of analysing anisotropies on neighbouring specimens of a sample; the differences are due to a variation of respective percentages of the two mineralogical parts, whereas the strain rate is constant. An application is given, in which data on the isothermal remanent magnetization anisotropy allow the checking of the validity of the method, which opens up the prospect for calibrating finite strain in rocks. (10 refs.)

64107 Initial premises for construction of a mathematical model of island arc formation. M.A.Ivakhnenko (Inst. of Cybernetics, Acad. of Sci., Ukrainian SSR).

Sov. Autom. Control (USA), vol.15, no.3, p.80-4 (May-June 1982). Translation of: *Avtomatika (USSR)*, vol.15, no.3, p.81-4 (May-June 1982). [received: April 1983]

Examination of the lineaments of the Earth's surface, including the island arcs, leads one to conjecture that they were formed by wave process. Measurements of distances between such lineaments and midocean ridges, followed by statistical processing of the results, verifies the wave theory. The nature of these waves is similar to that of wind waves, but the role of wind is played by the flow of the mantle material. Mechanical and chemical waves can also participate in this process, and this should be taken into account in construction of a model of the process of formation of island arcs. (7 refs.)

64108 The role of rifting in the tectonic development of the midcontinent, USA. G.R.Keller (Dept. of Geological Sci., Univ. of Texas, El Paso, TX, USA), E.G.Lidiak, W.J.Hinze, L.W.Braile.

Tectonophysics (Netherlands), vol.94, no.1-4, p.391-412 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).

Recent studies have proposed the existence of several major ancient rift zones in the midcontinent region of North America. Although the dating of some of these rifts are subject to question, an analysis of these 'paleo-rifts' reveals three major episodes of rifting: Keweenaw (~1.1 b.y. BP), Eocambrian (~600 m.y. BP), and Early Mesozoic (~200 m.y. BP). The extent of these events, documents that rifting has played a major role in the tectonic development of the midcontinent region. This role goes well beyond the initial rifting event because these features display a strong correlation with Paleozoic basins and a strong propensity for reactivation. Even though the importance of rifting can be established, recognition of rifts and delineation of their complexities remain a major problem which requires more study.

64109 Geologic and geochemical evidence for the nature and development of the Middle Proterozoic (Keweenaw) Midcontinent Rift of North America. J.C.Green (Geology Dept., Univ. Minnesota, Duluth, MN, USA).

Tectonophysics (Netherlands), vol.94, no.1-4, p.413-37 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981).

General models of active continental rifting must take into account the large plateau basalt provinces, many of which have been precursors of or associated

with continental breakup. The Keweenaw (Middle Proterozoic) Midcontinent Rift (MCR) of North America, 2300 km long, is one such major continental rift, but it aborted before significant crustal separation was achieved. These plateau-basalt rifts, including the MCR, differ from the East African type in being dominated by broad subsidence rather than rift valleys, tholeiitic flood basalts rather than alkalic central volcanoes, and large positive gravity anomalies. Geologic and geophysical evidence is reviewed which contradicts some recent models which have been proposed for the development of the MCR.

64110 Origin of the Oslo Graben in relation to the Hercynian-Alleghenian orogeny and lithospheric rifting in the North Atlantic. M.J. Russell, D.K. Smythe (Dept. of Appl. Geology, Univ. of Strathclyde, Glasgow, Scotland).

Tectonophysics (Netherlands), vol.94, no.1-4, p.457-72 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981). The contemporaneous extrusion of basalts in the Oslo Graben and intrusion and dolerites in northern Britain and southern Sweden at ~295 Ma calls for a common explanation. Two hypotheses are investigated: (1) the Graben and dykes resulted from extensional stresses associated with progressive lithosphere separation to the northwest of Europe in the Late Carboniferous; (2) the dykes, and therefore the Graben, were related in the same way to oblique collision of plates in the Hercynian orogeny which was developing to the south.

64111 Active versus passive continental rifting: evidence from the West African rift system. J.G. Fitton (Grant Inst. of Geology, Univ. of Edinburgh, Edinburgh, Scotland).

Tectonophysics (Netherlands), vol.94, no.1-4, p.473-81 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981). The West African rift system comprises the Cretaceous Benue trough and the Tertiary to Recent volcanic Cameroon line. The two features are remarkably similar in shape and size and may be superimposed perfectly by rotating one with respect to the other by 7° about a pole in Sudan. Three stages in the geological history of the system are postulated. (1) The Benue trough was produced by lithosphere stretching as one arm of an RRR triple junction during the early stages of the opening of the South Atlantic. (2) At about 80 Ma (Santonian) a short-lived period of clockwise rotation interrupted the otherwise anticlockwise rotation of Africa and decoupled the lithosphere from the asthenosphere. The hot zone in the asthenosphere beneath the Benue trough thus became displaced relative to the lithosphere and moved to a new position beneath Cameroon and the Gulf of Guinea. (3) Anticlockwise rotation and asthenosphere-lithosphere coupling were restored allowing the hot zone to manifest itself as the Cameroon line.

64112 Tectonic and geologic evolution of the Espanola basin, Rio Grande rift: structure, rate of extension, and relation to the state of stress in the western United States. M.P. Golombek, G.E. McGill, L. Brown (Lunar & Planetary Inst., Houston, TX, USA).

Tectonophysics (Netherlands), vol.94, no.1-4, p.483-507 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981). The Espanola basin of the Rio Grande rift began as a broad crustal down-warp in latest Oligocene time. The localized early faulting ended before the filling of the central Espanola basin was completed about 10 m.y. ago. Movement on faults that define the present western margin of the Espanola basin began ~10 m.y. ago. Jemez Mountain volcanism, in the western Espanola basin, also began at about this same time. West tilting of up to 30° occurred due to movement along pervasive N-trending intrabasin faults about 7.5 m.y. ago in conjunction with continued movement along the western border faults. Volcanism continued after this tilting, forming many of the large volcanic constructs of the Jemez Mountains. Regional uplift of the entire northern Rio Grande rift began ~7 m.y. ago. Movement on the Pajarito fault zone began about 5 m.y. ago and continues to the present. This fault zone defines the western margin of the Velarde graben. A change in the last principal stress direction from WSW-ENE to WNW-ESE that occurred throughout the western United States about 10 m.y. ago coincides with a roughly 3.5 times increase in the rate of extension, preferential development and movement of N- to NE-trending normal faults, and a few degrees of clockwise rotation of rocks in the western Espanola basin. Accelerated uplift of the northern Rio Grande rift also occurred at about this time indicating that activity in the entire Rio Grande rift was modulated by this change in extension direction ~10 m.y. ago that appears related to Pacific-North American plate interactions.

64113 Continental rift jumps. C.A. Wood (NASA Johnson Space Center, Houston, TX, USA).

Tectonophysics (Netherlands), vol.94, no.1-4, p.529-40 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981). Continental rift jumps, analogous to jumps of oceanic spreading ridges, are here proposed to be common. Good examples exist in Iceland and Afar (both transitional from ridge to rift jumps), West Africa (Benue Trough and Cameroon Volcanic Line), and Kenya. Indeed, the Kenya rift appears to have jumped c. 100 km eastward c. 10 m.y. ago and is currently jumping further to the east. Possible jumps exist in the Baikal rift, the Limagne-Bresse rift pair, and parallel to ancient continental margins. Continental rifts jump distances that are approximately equal to local lithosphere thickness, suggesting that jumped rifts are controlled by lithosphere fracturing, but there appears to be no reason for the fracturing except migration of hot spots.

64114 The chemical and thermal evolution of rifts. D.K. Bailey (Dept. of Geology, Univ. of Reading, Reading, England).

Tectonophysics (Netherlands), vol.94, no.1-4, p.585-97 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981). Any concept of the development of continental rifts requires the integration of observations on lithosphere structure, movements, and magmatic geology, with the ore customary geologic and geophysical evidence. Timing is crucial, and only the magmatism can chronicle the chemical and thermal changes in the underlying mantle. Control of the activity by older structures in the lithosphere is clear from the repetition of alkaline magmatism, which marks the release of gas-charged magmas from deep sources repeatedly tapped by reopening of lesions in the continental plate. Frequently this activity is found in ancient cratons where it perforates deeply eroded sections of granulites, themselves highly depleted in volatiles and presumably indicating a similar condition in the underlying mantle. This activity pattern, the abundance of volatiles and incompatible elements, and the capricious volcanic distributions, are explicable if the continental lithosphere acts as a template through which volatiles are channelled from the Earth's interior.

64115 Major stages of rifting evolution in the Earth's history. E.E. Milanovsky (Geological Dept., Moscow State Univ., Moscow, USSR).

Tectonophysics (Netherlands), vol.94, no.1-4, p.599-607 (1983). (Conference on the Processes of Planetary Rifting, St. Helena, CA, USA, 3-5 Dec. 1981). Linear extensional rift and rift-like structures have been generated many times during various periods of the Earth's history since early times. These structures have varied with time, however, in scale, morphology, formations,

paragenesis of tectonic features, regularity of distribution, and evolution. The author distinguishes and considers five major stages of rifting. They are: Katarchean-Archean, early Proterozoic, late Proterozoic, Paleozoic, and Mesozoic-Cenozoic.

64116 Computer fitting of continents. A.M. Hurley (British Nat. Oil Corp., Glasgow, Scotland), A.G. Smith.

In book: *Paleoreconstruction of the continents*, M.W. McElhinny, D.A. Valencio [Ed.], p.5-11. Washington, DC, USA: American Geophysical Union (1981), 194 pp.

Reviews methods of fitting continents using morphological contours together and provides a bibliography of relevant publications. (35 refs.)

64117 Pre-Cenozoic palynology and continental movements. E.M. Truswell (Bur. of Mineral Resources, Canberra, Australia).

In book: *Paleoreconstruction of the continents*, M.W. McElhinny, D.A. Valencio [Ed.], p.13-25. Washington, DC, USA: American Geophysical Union (1981), 194 pp.

Reviews developments in palynology, through the years 1970-79 as these relate to pre-Tertiary plate motions and continental positions. Discussion is restricted to those organic-walled microfossils of plant origin that are extracted after conventional recovery methods involving the maceration of rock samples with hydrochloric and hydrofluoric acids. As such, it encompasses the pollen and spores produced by terrestrial plants, and the resting cysts of marine algae—the dinoflagellates and acritarchs. (109 refs.)

64118 Paleozoic paleogeography. A.M. Zeigler (Dept. of Geophysical Sci., Univ. of Chicago, Chicago, IL, USA).

In book: *Paleoreconstruction of the continents*, M.W. McElhinny, D.A. Valencio [Ed.], p.31-7. Washington, DC, USA: American Geophysical Union (1981), 194 pp.

Reviews the available regional and world-wide reconstructions of the topography and bathymetry of the Paleozoic periods. A number of syntheses are available which show the continents in pre-Pangaea configurations. These use paleoclimatic, biogeographic and tectonic arguments to supplement the paleomagnetic data regarding the locations of the continents. Although a diversity of opinion has been expressed with respect to the orientation and even the east-to-west order of the continents, the maps of various authors share much in common. Doubtless, many of the finer details of Paleozoic plate relationships will be determined in the next few years as a number of groups are currently working on the topic. (33 refs.)

64119 Arctic seafloor structure and tectonic evolution. J.F. Sweeney (Dept. of Energy, Mines & Resources, Ottawa, Canada).

In book: *Paleoreconstruction of the continents*, M.W. McElhinny, D.A. Valencio [Ed.], p.55-64. Washington, DC, USA: American Geophysical Union (1981), 194 pp.

The age and present structure of much of the Arctic Basin has remained a mystery largely because of the unusual nature of many features of the seafloor and the lack of adequate geophysical data coverage over most of the ocean. This situation is rapidly changing as the results of several Arctic geophysical studies become known. It is now believed the Arctic Basin was created during Early Cretaceous time by the rotation of northern Alaska and the Chukotsk Peninsula away from northern Canada. The rotation may have been initiated by stress produced in the Arctic by the opening of the North Atlantic ocean. Geophysical and geological evidence from Arctic Canada and north of Alaska suggests that the North American margin of Canada Basin was created by rifting during Early Cretaceous time. (75 refs.)

64120 The tectonic evolution of the South China Basin. B. Taylor, D.E. Hayes (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).

In book: *Tectonic and geologic evolution of southeast Asian seas and islands*, D.E. Hayes [Ed.], p.89-104. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

The analysis of new and previously existing magnetic data has made it possible to identify a symmetric pattern of seafloor spreading in the South China Basin; this spreading was active from the mid-Oligocene to the Early Miocene (32-17 m.y. BP). The observed trend of magnetic lineations is approximately east-west, and the position of the relict spreading center coincides closely with the east-trending linear chain of seamounts near 15°N. The pattern of identifiable anomalies is confined to the eastern half of the basin. Magnetic quiet zones occur landward of the slope-basin boundary of the China and Reed-Bank Block margins. The quiet zone boundary is associated with a characteristic free-air gravity minimum and probably marks the location of the transition from oceanic to continental crust. Bore hole stratigraphic data from both the China shelf and the Reed Bank support the authors' conclusions regarding the timing of rifting and spreading indicated by the magnetic lineations. The eastern most extension of the Palawan Trough subduction zone is probably defined by the Uluang Fault. Northern Palawan was most likely attached to the Reed-Bank Block and the China Margin prior to the mid-Oligocene. The western third of the South China Basin is still poorly surveyed, but limited data suggest that there is a major change in spreading fabric in the southwestern corner of the basin. (45 refs.)

64121 Discrimination of tectonic displacement from slope-dependent errors in geodetic leveling from southern California, 1953-79. R.S. Stein (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).

Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.441-56

Jackson et al. (1980) contend that leveling before 1964 suffers from the accumulation of elevation-dependent errors in excess of one part in ten thousand times the topographic height difference (dH), or greater than 100 mm over 1000 m of relief. The contention of Jackson et al. is probed by a number of independent tests on 1100 km of levels carried out between 1953 and 1979 within the uplifted region. (24 refs.)

64122 Height dependent errors in southern California leveling. D.D. Jackson, W.B. Lee, C.-C. Liu (Dept. of Earth & Space Sci., Univ. of California, Los Angeles, CA, USA).

Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.457-72

For many profiles in southern California, the tilts inferred from repeat leveling data are strongly correlated with slopes. The ratio of tilt to slope at short wavelengths is nearly equal to that for long wavelengths, suggesting that the correlation results from height dependent systematic errors. A careful analysis of leveling data for southern California suggests to the authors that the reported aseismic uplift (Castle et al., 1976, 1977) can be more plausibly explained as the result of nontectonic effects including systematic leveling errors. (25 refs.)

64123 An asperity model of large earthquake sequences. T.Lay, H.Kanamori (Seismological Lab., California Inst. of Technol., Pasadena, CA, USA).

Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.579-92.

The variation in maximum rupture extent of large shallow earthquakes in circum-Pacific subduction zones is interpreted in the context of the asperity model of stress distribution on the fault plane. Four fundamental categories of behavior are observed. These are: (1) the Chile-type regular occurrence of great ruptures spanning more than 500 km; (2) the Aleutians-type variation in rupture extent with occasional ruptures up to 500 km long, and temporal clustering of large events; (3) the Kurile-type repeated failure over a limited zone of 100-300 km length in isolated events; and (4) the Marianas-type absence of large earthquakes. Southern Chile, Alaska, Southern Kamchatka, and possibly the Central Aleutians are grouped in the first category. The parameters governing large earthquake development are clarified. Interpretation of the four categories in terms of asperity distribution and interaction permits some inferences of the nature of stress distribution in particular zones. (70 refs.)

91.50 MARINE GEOLOGY AND GEOPHYSICS

64124 Vertical sedimentation units in a barrier island washover fan. S.P.Leatherman (Geography Dept., Univ. of Maryland, College Park, MD, USA), A.T.Williams.

Earth Surf. Processes & Landforms (GB), vol.8, no.2, p.141-50 (March-April 1983).

Overwash is a major component of a barrier island's response to high energy conditions. Examination of the 19-20 March, 1975, storm deposits at Assateague Island, showed that an overwash sequence could be divided into sedimentation units. Interpretation depends upon defining textural and mineralogical combinations that can be logically ordered as a vertical sequence. If the sequence is depositional and formed from a single material, normal grading usually results; if polymineralogical and erosionally truncated, inverse grading with a top layer of heavy minerals can be formed via an in situ sorting process dependent on disturbance depth and overwash influence. (12 refs.)

64125 Systematic monthly morphologic variation of Assawoman Inlet: nature and causes. R.Slingerland (Dept. of Geosci., Pennsylvania State Univ., University Park, PA, USA).

Earth Surf. Processes & Landforms (GB), vol.8, no.2, p.161-9 (March-April 1983).

Assawoman Inlet, Virginia, USA, representative of small mesotidal barrier island tidal inlets exhibits systematic variations of sediment volume among certain of its morphologic elements. Sediment volume variations were calculated from topography-bathymetric maps of the inlet system, as surveyed on 11 occasions at approximately monthly intervals by a fathometer, and plane table and alidade. Of 36 pairings among nine morphologic elements, seven show statistically significant Pearson Product Moment Correlation Coefficients. The southern ramp margin shoals are negatively correlated with the southern beach face and the northern ramp margin shoals are negatively correlated with the northern beach face on the northern spit. The southern and northern ramp margin shoals themselves are negatively correlated. Some other erosional and depositional phenomena were studied. (16 refs.)

64126 Preliminary estimates of intertidal limestone erosion, One Tree Island, southern Great Barrier Reef, Australia. S.T.Trudgill (Dept. of Geography, Univ. of Sheffield, Sheffield, England).

Earth Surf. Processes & Landforms (GB), vol.8, no.2, p.189-93 (March-April 1983).

Estimations of surface lowering of 0.2-3.8 mm a⁻¹ were gained from measurements of pedestal heights under sedentary organisms. The role of erosion by chitons, estimated at 0.2-2.9 mm a⁻¹ for home scars and 0.2-0.7 mm a⁻¹ for grazing, and other bioerosive organisms, is briefly discussed. (18 refs.)

64127 Var and Pailion canyons (Southern Alps Margin-Western Mediterranean): a Quaternary origin through sliding. F.Guillocheau (Univ. de Bretagne, Brest, France), G.Pautot, J.M.Auzende.

C.R. Seances Acad. Sci. Ser. II (France), vol.296, no.1, p.91-6 (10 Jan. 1983). In French.

A morphological analysis of the Baie des Anges (Nice) Seabeam map has been carried out in order to investigate the genesis of the Var and Pailion submarine canyons. From the identification of the morphological units at different scales it is possible to propose a model for the formation of the canyons. The Var and Pailion canyons are interpreted as being cut in a deep-sea fan presently being destroyed by mass wasting processes. The structural framework exhibits an orthogonal fault system which plays a prominent role in the spatial distribution of the canyons and the sliding areas. The age of these canyons is thought to be Quaternary. (7 refs.)

64128 Acoustical classification of sea floor sediments. Meng Jin-sheng, Guan Dian-hua (Inst. of Acoustics, Acad. Sinica, Peking, China).

Acta Acust. (China), vol.7, no.6, p.337-43 (Nov. 1982). In Chinese.

Discusses the classification of seabed sediment using normally incident, high frequency sound pulses. A number of investigators used reflectivity of sound on the sea bottom and other quantities as features for classification of sediment types. The authors suggest a new feature which is independent of reflectivity and roughness of the seabed. The authors feature is extracted from relative form of echo envelope, it strongly correlates to attenuation of sound in sediments. The attenuation of sound is nearly proportional to frequency and at the authors frequency (120 kHz) the attenuation in different sediments varies over a tenfold range. In order to avoid the influence of surface backscattering, they used a directive transducer put near to the bottom. In the laboratory a Bayes classification was carried out by computer, and a fairly high success rate was achieved. (22 refs.)

64129 Bathymetric and oceanographic applications of Kalman filtering techniques. R.F.Brammer, R.P.Pass, J.V.White (Analytic Sci. Corp., Reading, MA, USA).

IEEE Trans. Autom. Control (USA), vol.AC-28, no.3, p.363-71 (March 1983).

Ocean currents and seamounts (underwater mountains) can be mapped by analyzing data from satellite radar altimeters. The paper describes the application of kalman filtering techniques to the analysis of such data acquired during the SEASAT mission. The altimeter data are modeled as samples from autoregressive random processes. Based on these models, matched filters are used to detect the characteristic nonstationarities in the altimeter data caused by seamounts and ocean currents such as the gulf stream. The geostrophic velocities of detected ocean currents are then estimated using Kalman smoothers. A useful formula is derived, which expresses the error power spectrum of the optimal fix lag smoother as a function of the lag and the error spectra of the optimal filter and the optimal infinite-lag smoother. (15 refs.)

64130 Microcomputer-aided analysis of hydroacoustical receiver signals. H.-D.Melzer, E.Muller (Sektion Tech. Elektronik, Wilhelm-Pieck-Univ., Rostock, Germany).

MSR (Mess. Steuern Regeln) (Germany), vol.26, no.3, p.150-4 (March 1983). In German.

The application of adaptive receiver structures for hydroacoustical sediment detection and identification requires microcomputer-aided signal processing in order to obtain on-line the a priori information necessary for optimization of the receiver equipment and to determine the interesting object parameters. The determination of the significant process parameters and indices for a specific tracking situation is carried out by an extensive analysis of the disturbed tracking signals reflected by the sea bed. (5 refs.)

64131 Sea-bed geology goes up the mountains. S.McCutcheon.*New Sci. (GB)*, vol.97, no.1346, p.510-13 (24 Feb. 1983).

By drilling into the mountains on Cyprus geologists are hoping to learn more about the sea bed. The highest rocks on the island, it seems, once lay deep beneath the sea. The author describes the activities of an informal group of earth scientists known as the International Crustal Research Drilling Group (ICRDG). (no refs.)

64132 Evidence for Eocene oceanic crust in the Celebes Basin. J.K.Weisel (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).In book: *Tectonic and geologic evolution of southeast asian seas and islands*, D.E.Hayes [Ed.], p.37-47. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

Marine magnetic lineations identified as anomalies 18-20 (42-47 m.y. BP) are mapped striking approximately N65°E in the southwestern part of the Celebes Basin. Middle to late Eocene crustal ages inferred from the lineations are compatible with ages predicted from observed basement depths and heat flow. Subduction of unknown amounts of Celebes Basin crust long its margins at the presently active North Sulawesi and Cotabato trenches and possibly at the Sulu island arc during the Oligocene prevents a determination of the total duration of crustal accretion and original geographic extent of the crust in the basin. Analysis of magnetic anomaly shapes suggests little net change in latitude since the Eocene, but whether the basin has rotated during this time remains unresolved. While the Celebes Basin results are compatible with paleomagnetic measurements from Upper Cretaceous rocks in southwestern Borneo, distinctly different paleomagnetic results from the West Philippine Basin (also the Eocene age) indicate large relative displacement between the two marginal basins since the Eocene. By interpolation between observed crustal ages, heat flow, and basement depths from the South China and Celebes basins in Oligocene age is suggested for the Sulu Basin. (31 refs.)

64133 The structure and evolution of the Central Basin Fault, West Philippine Basin. S.D.Lewis, D.E.Hayes (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).In book: *Tectonic and geologic evolution of southeast asian seas and islands*, D.E.Hayes [Ed.], p.77-88. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

Bathymetric and seismic profiler data were used to investigate the morphological and structural nature of the Central Basin Fault. The Central Basin Fault (CBF), a spreading ridge that was active during the early Tertiary, is composed of a series of ten echelon ridges and troughs whose individual trends are 280°-285°, while the regional trend of the large-scale zone of rough topography is more nearly 300°. Cross-strike offsets of linear deeps suggest the presence of several fracture zones. The CBF can be divided into three provinces on the basis of sediment distribution, morphology, and structural style. The southeastern province from the Palau-Kyushu Ridge to about 132°E is a region of rough basement topography that is elevated 600-800 m above the surrounding basin floor. Local deeps contain faulted and/or folded sediments up to 0.9 s in thickness. From 132°E to 128°E the central province is characterized by very rough basement topography and thin (<0.1 s) sediment cover. West of 128°E and CBF exhibits more subdued basement topography, which is often buried under thick sediments. Faulting is less frequent than in the southeast region, and east of 126°E the morphologic character of the CBF is lost. Strike-slip and normal faults with trends roughly parallel to the CBF can be recognized in the areas of the CBF where thick and well-stratified sediments are present to serve as markers for fault offset. Much of the observed faulting probably represents rejuvenation of the CBF as an active tectonic feature, following a late Eocene cessation of seafloor spreading. (20 refs.)

64134 Quaternary sedimentation processes in the South China Basin as revealed by echo-character mapping and piston-core studies. J.E.Damuth (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).In book: *Tectonic and geologic evolution of southeast asian seas and islands*, D.E.Hayes [Ed.], p.105-25. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

Quaternary sedimentation throughout the South China Basin has been predominantly by downslope processes (e.g. turbidity currents and mass wasting). No evidence for sediment redistribution by thermohaline (contour) currents is observed. The seafloor of the basin returns eight discrete types of bottom echoes on 3.5 kHz echograms. These are all similar to echo types observed previously in the Atlantic Ocean. Various echo types reveal near-bottom sedimentation processes active within the basin as well as the distribution of coarse (silt/sand) sediment within the uppermost sea floor. A qualitative correlation is observed between relative abundance of bedded silt/sand in piston cores and three echo types. A large (~25000 km²) field of migrating sediment waves (echo type IIC) occurs on the down-bending seaward wall of the Manila Trench and parallels the trench floor for 450 km. The regional setting and sediments of these waves indicate that they have been formed by turbidity currents flowing southward along the Manila Trench floor. (55 refs.)

64135 Morphology and shallow structure of the lower trench slope off Nias Island, Sunda Arc. D.E.Karig (Dept. of Geological Sci., Cornell Univ., Ithaca, NY, USA), G.F.Moore, J.R.Curry, M.B.Lawrence.In book: *Tectonic and geologic evolution of southeast asian seas and islands*, D.E.Hayes [Ed.], p.179-208. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

The lower third of the slope between the Sunda Trench and Nias, on the trench slope break, was surveyed in detail as part of the Seatar Sumatra Transect. Oblique subduction of early Tertiary oceanic crust, which is overlain by 2-3 km of Nicobar Fan strata and by a trench wedge less than 500 m thick, has produced an accretionary prism with linear ridges and troughs. The lowermost trench slope is convex upward. Across the steepest decrease in slope, 20-30 km from the trench, there is an increased ridge spacing and a pronounced increase in the thickness of slope sediments. The basal ridge is uplifted along a thrust fault that dips 20°E beneath the arc and has several kilometers of horizontal displacement. Less than half the total convergence occurs on this basal thrust, with most of the remainder distributed across the steep basal slope. Very little convergence is absorbed across the rest of the trench slope, where large slope basins have developed. These basins are filled with several kilometers of turbidites that define arcward rotating sediment wedges rather than synclines. (65 refs.)

64136 A seismic reflection study of faulting in the Mariana fore arc. C.L.Mrozowski, D.E.Hayes (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA).In book: *Tectonic and geologic evolution of southeast asian seas and islands*, D.E.Hayes [Ed.], p.223-34. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

Extensive geophysical and geological data have been collected across the Mariana arc trench system. Part of these data are analysed and a preliminary map of shallow structures in the Mariana fore arc is presented. Water depth in the study area increases from 2400 m near the base of the north-trending Mariana Ridge (arc) complex in the west to about 420 m at the trench-slope

break. The sediment-smoothed seafloor is frequently offset across fault scarps. Scarp heights range from 10 to 250 m. Seismic reflection data show that sediment reflectors and basement are also offset across the faults. The faults are high-angle; normal motions have occurred on them, but strike-slip motions have not been detected. Two structural provinces that are parallel to the arc have been identified. A broad western province is marked by thick stratified sediments above an eastward-shoaling volcanic basement. The basement is characterized by overlapping diffraction hyperbolae on unmigrated MCS profiles. Major faults and horst blocks are present. An eastern province rests on the crest of a fore arc volcanic ridge and is characterized by thin sediments and many small normal faults with down-dropped blocks toward the trench. (28 refs.)

64137 Evolution of back arc spreading and arch volcanism in the Philippine Sea: interpretation of Leg 59 DSDP results. R.Scott (Dept. of Geology, Texas A&M Univ., College Station, TX, USA), L.Kroenke.In book: *Tectonic and geologic evolution of southeast asian seas and islands*, D.E.Hayes [Ed.], p.283-91. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

During the evolution of marginal basins and remnant arcs in the Philippine Sea both back arc spreading and arc volcanism are episodic. The early stage of back arc spreading of the Parece Vela Basin had little or no associated arc volcanism, and the last period of West Mariana Ridge arc volcanism occurred after Parece Vela Basin back arc spreading had ceased. Probable back arc spreading in the West Philippine Basin occurred between about 52 and 37 m.y. ago. Tholeiitic volcanism on the Palau-Kyushu arc may have persisted from about 42 to about 29 m.y. ago. Cessation of this volcanism coincided roughly with the sundering of the old Palau-Kyushu arch down its magmatic axis, thus initiating back-arc spreading of the new Parece Vela Basin. The Parece Vela period of back arc spreading continued from 30 m.y. ago to sometime between about 18 and 14 m.y. ago. West Mariana calc-alkalic arc volcanism was superimposed upon the old rifted fore arc of the extinct Palau-Kyushu arc between 20 and 9 m.y. ago. Again, the cessation of arc volcanism coincided with the sundering of the arc and initiation of back arc spreading of the Mariana Trough. Modern calc-alkalic arc volcanism resumed on the Mariana arc about 15 m.y. ago, roughly at the time of initiation of Mariana Trough spreading. A lack of volcanism during subduction is an unanswered petrological enigma. (52 refs.)

Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

The overall structure of the Oslo rift-system can be viewed as the result of interference between a N-S trending Permian fault system and a regional NE-SW trending Precambrian shear-zone. The formation of the Oslo Rift system apparently reflects a passive continental rifting which was gradually

succeeded by considerable igneous activity. Important porphyry-molybdenum mineralization in the Oslo region is associated with shallow level magmatism in the Glitrevann and Hurdal areas. Molybdenum mineralization of the Oslo province is closely associated with highly differentiated alkali granites which possess striking similarities to Mo-related granites of the Colorado Mo province and evolved Rapakivi- or A-type granites usually considered to be typically associated with bimodal magmatism of crustal extension and continental rifts.

64139 Variations in geologic structure along the Sunda fore arc, northeastern Indian Ocean. G.F. Moore, J.R. Curran, D.G. Moore (Geological Res. Div., Scripps Instn. of Oceanography, La Jolla, CA, USA), D.E. Karig. In book: *Tectonic and geologic evolution of southeast asian seas and islands*, D.E. Hayes [Ed.], p.145-60. Washington, DC, USA: American Geophysical Union (1980), v+326 pp. [0 87590 023 2]

The great lateral extent of the Sunda Arc allows variations in several geological parameters to be observed along the arc. Subduction varies from nearly perpendicular off Java to highly oblique off Burma. The thickness of sediments entering the subduction zone ranges from greater than 5 km in the northwest to less than 1 km in the southeast. Geologic variations along the arc produce corresponding changes in trench-slope structures. In the north, thick sediments of the Bengal and Nicobar fans are scraped off the descending oceanic plate and accreted in discrete gentle fold units bounded by imbricate thrusts. The lower trench slope is characterized by a ridge and trough morphology, with slope sediments filling the troughs. In the south, no clear internal structure can be observed between landward dipping reflectors that have been interpreted as imbricate thrust faults, suggesting that deformation is more intense in the south than in the north. The ridge and trough morphology is less pronounced than in the north. This difference is interpreted in structural style as mainly being due to a decreasing strain rate at the trench from south to north, caused primarily by the increase in thickness of sediments entering the trench and secondarily by a slower perpendicular component of subduction in the north. 91.90 OTHER TOPICS IN SOLID EARTH GEOPHYSICS

64140 Field evaluation of some sand transport models. N.H. Berg (Forest Service, US Dept. of Agriculture, Berkeley, CA, USA), *Earth Surf. Processes & Landforms* (GB), vol.8, no.2, p.101-14 (March-April 1983).

Fluorescent tracer procedures were used to monitor the movement of three commercially purchased sands in a natural dune environment. Results were compared with estimates of transport rates from three theoretical models. Estimates from models by Bagnold (1941) and Hsu (1971) were larger by as much as one order of magnitude than the rates observed in the tracer study. The model of A.A. Kadib (1965) provided closer correspondence to observed transport rates for medium sand (mean diam. 0.653 mm) but underestimated rates for coarse sand (mean diam. 0.992 mm). (34 refs.)

64141 Sorted stripes on Sub-Antarctic Kerguelen Island. K. Hall (Geography Dept., Univ. of Natal, Pietermaritzburg, S. Africa), *Earth Surf. Processes & Landforms* (GB), vol.8, no.2, p.115-24 (March-April 1983).

Observations of sorted stripes at nine different localities on sub-Antarctic Kerguelen Island are presented. The study sites range from 25-600 m above sea level and are of varying aspect. It is found that there is a strong relationship between stripe orientation and the wind direction, to the extent that at one locality stripes were oriented across a slope. Stripe width was seen to increase with altitude, and, in addition, the coarse stripe was dominant at lower elevations and the fine stripe at higher elevations. At one site a secondary set of stripes was observed to occur within the fine stripe of a primary larger set. On a trachyte plug there was evidence of lateral squeezing in the formation of the stripes. A number of minor observations pertaining to the possible mechanism of stripe formation are given. (33 refs.)

64142 Flood-related channel change in an arid-region river. W.L. Graf (Dept. of Geography, Arizona State Univ., Tempe, AZ, USA), *Earth Surf. Processes & Landforms* (GB), vol.8, no.2, p.125-39 (March-April 1983).

A review of 112 years of change in the channel of the Salt River, central Arizona, USA, shows that this arid-region river has a main-flow channel that has migrated laterally up to 1.6 km (1 mi) in response to flood events. Maps

showing locational probabilities indicate that along the channel zones of relative locational stability alternate with zones of relative instability at a 3.2 km (2 mi) interval. Construction of upstream reservoirs has reduced sediment input into the main river but has not controlled floods. The channel width has not changed except for moderate fluctuations around mean values; the main-flow channel has incised approximately 6 m (20 ft) over most of the 48 km (30 mi) study reach during six recent floods. Gradient has remained unchanged. During floods bed material was mobilized to a depth below the original bed level that was greater than the height of the water surface above the original bed. Calculations based on tractive force indicate a threshold discharge of instability that is equal to the flow with a five-year return interval. The river exhibits remarkable stability with respect to gradient and sinuosity, irrespective of water and sediment discharges, but horizontal channel location exhibited selective instability. (31 refs.)

64143 Spatial variation in solutional denudation and soil moisture over a hillslope hollow. R.W. Crabtree (School of Geography, Univ. of Leeds, Leeds, England), T.P. Burt.

Earth Surf. Processes & Landforms (GB), vol.8, no.2, p.151-60 (March-April 1983).

A spatial pattern of relative solutional denudation is described for a hillslope hollow and adjacent spurs at Bicknoller Combe, Somerset. The pattern was obtained from a network of micro-weight loss rock tablets emplaced in the soil. The results show that the hollow is the main locus of solutional denudation. The soil moisture distribution over the hollow indicates that it is a transmission zone for acid soil water percolating from the adjacent spurs to the saturated wedge at the base of the hollow. The wetter acid soils in the hollow are responsible for the relatively higher solutional denudation taking place in the hollow. (21 refs.)

64144 Numerical integration method for seabed response to water waves. T. Yamamoto (Rosenstiel School of Marine & Atmospheric Sci., Univ. of Miami, Miami, FL, USA).

Int. J. Soil Dyn. & Earthquake Eng. (GB), vol.2, no.2, p.92-100 (April 1983). The problem of continuously layered seabed response to water waves is solved by numerically integrating the displacement stress vectors. It is found that the commonly used approximation by discrete homogeneous multi-layers causes stress discontinuities at the interfaces between the sublayers and may invite serious errors in stability analyses of foundations. The numerical integration theory is verified with good accuracy by wave tank experiments on the motions and wave damping by clay beds. The numerical calculations of motions of the Mississippi Delta clay bed by the present theory give much smaller displacements of bed compared to the results from the quasi-static analyses by discrete homogeneous multi-layer approximations. A criterion for choosing between total stress analysis and effective stress analysis is also proposed. (31 refs.)

64145 Generation of topographic vortices and their possible effect on formation of productive zones in the ocean. Yu.N. Golubev, P.D. Lomakin, L.V. Cherkasov (Acad. of Sci., Ukrainian SSR).

Dopov. Akad. Nauk UkrSR. Ser. A (USSR), no.2, p.25-8 (1983). In Ukrainian.

Investigates the generation of topographic eddies and their influence on the formation of a zone of higher biological productivity in the region of the Ob bank (Antarctic sector of the Indian Ocean). (3 refs.)

64146 The M2 oceanic tide recovered from Seasat altimetry in the Indian Ocean. P. Mazzega (CNES/GRGS, Toulouse, France).

Nature (GB), vol.302, no.5908, p.514-16 (7 April 1983).

Seasat altimeter data, which provide measurements of the instantaneous ocean level, are used to create a model of the M2 oceanic tide in the Indian Ocean. This approach avoids the assumptions introduced in the hydrodynamical tide models and take advantage of a regular distribution of the data over the whole ocean. The hydrodynamical and empirical models that have been proposed for this ocean exhibit strong discrepancies, particularly in the deep ocean so that the use of altimeter data is of particular interest. The author investigates a new method to obtain the amplitude and phase of M2 in a large region. The validity of the model is checked using synthetic data and by comparison with tide gauge data. (25 refs.)

64147 Relaxation processes for internal waves in mesoscale flow. K.M. Watson (Marine Phys. Lab., Scripps Instn. of Oceanography, San Diego, CA, USA).

Proc. Natl. Acad. Sci. USA, vol.80, no.4, p.1144-6 (Feb. 1983).

A dynamical 'test-wave' model has been developed to study transport phenomena within oceanic internal wave fields. This model is extended to describe effects of a mesoscale flow field on internal wave transport. Previous work with weak-interaction perturbation theory has suggested a substantial enhancement due to mesoscale currents. Extension to the strong-interaction regime in the present paper suggests a relatively small effect due to mesoscale interactions. (9 refs.)

64148 Experimental study of volume scattering function of particles suspended in water. S. Sugihara (Oceanographic Instrumentation Lab. Inst. Sci. & Chem. Res., Saitama, Japan), M. Kishino, N. Okami.

Phys. Pap. Inst. Phys. & Chem. Res. (Japan), vol.76, no.4, p.96-9 (Dec. 1982).

Very strong light scattering in the backward region is not unusual even for natural sea water, and phytoplankton plays an important role on the enhancement of the back-scattering. Phytoplankton role on the enhancement of the back-scattering. Phytoplankton wall structure is responsible for the enhancement in back-scattering by phytoplankton. Vertically and horizontally

polarized components of volume scattering function might supply important information for the study of the interaction between light and particles. Vertical and horizontal components of volume scattering function for the cultures of *Chaetoceros socialis*, and *Skeletonema costatum* were therefore measured with a scatterometer. A polarizer was inserted between the light source and sample cell. Both components were recorded at every 5° interval in an angular range of 20° to 150°. (3 refs.)

64149 Objective analysis of Northern hemisphere ocean surface temperatures. A.N.Bagrov, N.N.Kozhevnikova (Hydrometeorological Sci. Res. Center, USSR).

Sov. Meteorol. & Hydrol. (USA), no.12, p.54-9 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.12, p.69-76 (1981).

A scheme for objective analysis of the ocean surface temperature field on the Northern Hemisphere that uses an optimum-interpolation procedure is described. The analysis is based on ship observations accumulated over five days. The data are put through climatic and horizontal control. The scheme is run on a BESM-6 computer in FORTRAN. The results are put out at the nodes of a 2.5X2.5-degree grid that covers the entire Northern Hemisphere (except for land areas and circumpolar regions). Recommendations toward further improvement of the results are given. (8 refs.)

64150 Planetary waves of seasonal origin in the ocean. A.A.Kutalo (Hydrometeorological Sci. Res. Center, USSR).

Sov. Meteorol. & Hydrol. (USA), no.1, p.56-60 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.1, p.71-7 (1982).

The correspondence between observed features of the water temperature distribution in the northeast Atlantic to those predicted by hydrodynamic modelling of the ocean is analyzed. It is concluded that the medium-scale organization of the temperature field is based on oceanic planetary waves of seasonal origin. (13 refs.)

64151 Vertical coherence of semi-diurnal tidal currents on the 1970 hydrophysical test range in the Atlantic. V.N.Bol'shakov, S.K.Gulev, A.S.Matygin (All Union Sci. Res. Inst. of Hydrometeorological Information World Data Center, USSR).

Sov. Meteorol. & Hydrol. (USA), no.1, p.61-4 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.1, p.78-91 (1982).

More than a million current-vector measurements have been processed. The variation of semi-diurnal-current coherence in the vertical establishes that the semi-diurnal currents above and below the density-discontinuity layer are independent. Below the 200-meter depth, in the layer in which the Vaisala frequency varies smoothly, the scale of the vertical coherence is estimated to be 900 meters. (8 refs.)

64152 Channel width-drainage area relations in small basins. M.J.Carragher (Univ. of Salford, Salford, England), M.Klein, J.R.Petch. *J. Hydrol. Processes & Landforms (GB)*, vol.8, no.2, p.177-81 (March-April 1983).

The measurement of stream channels in basins less than 3 km² shows compound relations between width and area. Break points in the relations may be attributed to the changing contribution of rapid storm flow and to the effect of bed material size. (8 refs.)

64153 The measurement of watertable levels in structured clay soils by means of open auger holes. A.C.Armstrong (Ministry of Agriculture Fisheries & Food, Cambridge, England).

Earth Surf. Processes & Landforms (GB), vol.8, no.2, p.183-7 (March-April 1983).

In structured clay soils, water levels in open auger holes (dipwells) respond to water movement through macropores and may mask the existence of drier zones either at depth or within beds. Variability between replicated dipwells expresses the small scale variation in the soil, and statements about soil water

regimes should be made in statistical terms. Suitably replicated dipwells give sufficiently precise measurements of mean watertable position for studies of soil water regimes. (19 refs.)

64154 Transport equations for heat and moisture in the soil and their application to boundary layer problems. U.Sievers, R.Forkel, W.Zdankowski (Inst. fur Meteorologie, Johannes Gutenberg-Univ., Mainz, Germany).

Contrib. Atmos. Phys. (Germany), vol.56, no.1, p.58-83 (1983).

The methods of irreversible thermodynamics are used to obtain a consistent set of transport equations for heat and moisture in the soil. It is found that the empirical diffusion laws for moisture are in harmony with the requirements of the linear Onsager theory. The new set of prognostic equations is subjected to thermodynamic filtering and is then coupled to a model of the atmospheric boundary layer. Extensive calculations are carried out to determine the influence of soil type and moisture on the atmospheric state. (22 refs.)

64155 Regime of the Filchner-Ronne ice shelves, Antarctica. G.deQ.Robin, C.S.M.Doake, H.Kohnen, R.D.Crabtree, S.R.Jordan, D.Moller (Scott Polar Res. Inst., Univ. of Cambridge, Cambridge, England).

Nature (GB), vol.302, no.5909, p.582-6 (14 April 1983).

Seismic, radio-echo, TWERLE balloon and oceanographic data of the Filchner-Ronne ice shelves are analysed. A large thin area in the central Ronne ice Shelf is found to differ from the morphology of the Ross and Filchner ice shelves. This area is partly filled by basal saline ice, which can be attributed to regional regelation caused by oceanic circulation. (34 refs.)

64156 River flows as dissipative systems. V.I.Nikora (Odessa Hydrometeorological Inst., Odessa, USSR).

Sov. Meteorol. & Hydrol. (USA), no.12, p.66-9 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.12, p.84-8 (1981).

The 'flow-mobile channel' system is considered from the premises of dissipative-structure theory. It is shown that the minimum energy dissipation principle proposed by M.A. Velikanov is consistent with the fundamental Prigogine-Glensdorf principle of minimum entropy production as applied to river hydraulics. (8 refs.)

64157 Spatial correlation functions of maximum discharge volumes in mountain rivers. M.A.Mamedov (State Univ., Baku, Azerbaijan SSR).

Sov. Meteorol. & Hydrol. (USA), no.12, p.70-3 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.12, p.89-93 (1981).

The spatial structure of the fluctuations of maximum discharge volume in mountain rivers is investigated. In view of the influence of topography in determining the maximum volumes of mountain rivers, the spatial correlation function is represented as the dependence of the pair correlation coefficients on the square root of the product of the distance between the drainage-basin centers times the difference between the average elevations of the basins. The homogeneity of the spatial correlation function is estimated. (5 refs.)

64158 Long-term forecasting of high water levels at ice dams on the Angara at Kamenska. V.N.Karnovich, T.V.Kuleshova (Sci. Res. Inst. of Hydraulic Engng., USSR).

Sov. Meteorol. & Hydrol. (USA), no.12, p.83-5 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.12, p.105-7 (1981).

The results of an analysis of ice-damming factors and a procedure for long-term forecasting of high water levels at ice dams on the Angara River at Kamenska are set forth. (4 refs.)

64159 Determination of the rate of development of morphological formations in river channels from indirect criteria. A.A.Levashov (Leningrad Hydrometeorological Inst., Leningrad, USSR).

Sov. Meteorol. & Hydrol. (USA), no.1, p.79-81 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.1, p.97-9 (1982).

Field determinations of sandbar reshaping rates are reported. A method is proposed for determining the ages of morphological formations from various natural criteria. (1 ref.)

92.60 METEOROLOGY

(see also 43.28 Aeroacoustics and atmospheric sound)

- 64160 The NO/NO₂/O₃ photostationary state in Claremont, California.** R.E.Shetter, D.H.Stedman, D.H.West (Univ. of Michigan, Ann Arbor, MI, USA). *J. Air Pollut. Control Assoc. (USA)*, vol.33, no.3, p.212-14 (March 1983). Seventeen days of detailed measurements of NO, NO₂, O₃, HNO₃ and the frequency of NO₂ photolysis—(NO₂)—were carried out in Claremont, CA, in September 1980. Under conditions when the rate of change of NO concentration is small, there must be a balance between formation and loss processes. In the classical photostationary state this balance is between NO₂ photolysis: NO₂+hv→NO+O and reaction with ozone: NO+O₃→NO₂+O₂. The results show that the latter reaction with ozone is inadequate to balance the formation step; a significant contribution is required from another NO oxidation process, possibly peroxy radical oxidation. If so, the inferred concentration of peroxy radicals shows a diurnal variation, peaking around solar noon. (20 refs.)
- 64161 Air quality screening model with long-term averaging.** D.Golomb, S.Batterman, J.Gruhl (MIT, Cambridge, MA, USA). *J. Air Pollut. Control Assoc. (USA)*, vol.33, no.3, p.215-19 (March 1983). A simple screening model is presented for estimating maximum ground level concentrations of air pollutants from single elevated buoyant sources of emissions. The model, which incorporates plausible error margins, is based on the Gaussian dispersion formula. Maximum longer-term (3, 8, 24 h) concentrations are estimated using a joint probability analysis of the persistence of meteorological worst case events. (9 refs.)
- 64162 Return-stroke electromagnetic fields of oblique lightning channels.** G.Becker, H.Volland (Radioastron. Inst., Univ. of Bonn, Bonn, Germany). *Contrib. Atmos. Phys. (Germany)*, vol.56, no.1, p.1-13 (1983). The resonant wave guide model of lightning currents simulating return strokes (R strokes) has been extended to oblique but straight lightning channels. In this model discrete resonant wave modes are generated. Only the first mode is dominant, while higher order modes can be neglected in a first approximation. The electromagnetic field of R strokes has been calculated at various distances from the source. (10 refs.)
- 64163 On the influence of nonlinear wave-wave interaction in a 3-D primitive equation model for sudden stratospheric warmings.** K.Rose (Inst. fur Meteorologie, Freie Univ. Berlin, Berlin, Germany). *Contrib. Atmos. Phys. (Germany)*, vol.56, no.1, p.14-41 (1983). In order to numerically simulate sudden stratospheric warmings, two versions of a 3-D primitive equation model are developed, one with and one without nonlinear wave-wave interaction terms. Six model runs were performed. A qualitative discussion of the wave propagation shows that wave transience rather than interaction at critical lines is involved in the reversal of the polar westerlies. (19 refs.)
- 64164 A radiation model using hourly meteorological data with results from GATE.** M.A.Atwater (TRC Environmental Consultants Inc., East Hartford, CT, USA), J.T.Ball. *Contrib. Atmos. Phys. (Germany)*, vol.56, no.1, p.42-57 (1983). A solar and infrared flux model that includes partial cloudiness is applied to data from GATE Phase III. Flux convergence profiles were computed from the surface to 350 mb for infrared, solar and net radiation. (36 refs.)

- 64165 On the influence of meteorological parameters on extinction and mass size distributions in the urban aerosol of Vienna.** R.Pirich, H.Horvath (Inst. fur Experimentalphys., Univ. Wien, Wien, Austria). *Contrib. Atmos. Phys. (Germany)*, vol.56, no.1, p.84-93 (1983). During the winters of 1979/80 and 1980 extinction coefficients were measured with a telephotometer and mass size distributions with a low pressure cascade impactor in the urban area of Vienna, Austria. The dependence of extinction on relative humidity is analysed. (20 refs.)
- 64166 On single station forecasting: sunshine and rainfall Markov chains.** K.Fraedrich, K.Muller (Inst. fur Meteorologie, Freie Univ. Berlin, Berlin, Germany). *Contrib. Atmos. Phys. (Germany)*, vol.56, no.1, p.108-34 (1983). Probabilities of weather states are predicted by first order Markov chains using single station data only. Two examples of weather phenomena are discussed which are particularly suited for short range forecasting: daily sunshine measurements and the rainfall combined with three hourly past weather observations at Berlin-Dahlem. Two probability forecasts are distinguished, both of which start from an initial observation. Finally it is shown how the diurnal cycle can be included in the Markov chain forecasts. (21 refs.)
- 64167 Doppler-SODAR measured variation of mean and turbulent wind field during PUKK.** C.Wamser (Max-Planck-Inst. fur Meteorologie, Hamburg, Germany), W.J.Muller. *Contrib. Atmos. Phys. (Germany)*, vol.56, no.1, p.135-46 (1983). Some interesting structures of nonstationary processes within the coastal boundary layer, measured by a three-component monostatic Doppler-SODAR during the field experiment PUKK close to the North Sea coast are presented. A short description of the system and an illustration of typical SODAR-profiles are given. Finally, frequency distributions of wind direction and velocities at different heights derived from nearly 1500 SODAR profiles during PUKK are compared with corresponding simultaneous SODAR-measurements at the nuclear power plant at Esensham, about 40 km south of the PUKK SODAR-station. (12 refs.)
- 64168 Major ion composition and chemical associations of inorganic atmospheric aerosols.** R.M.Harrison, C.A.Plo (Dept. of Environmental Sci., Univ. of Lancaster, Lancaster, England). *Environ. Sci. & Technol. (USA)*, vol.17, no.3, p.169-74 (March 1983). Atmospheric aerosols were sampled and analyzed for H⁺, NH₄⁺, Ca²⁺, Mg²⁺, Na⁺, K⁺, SO₄²⁻, Cl⁻ and NO₃⁻. Gaseous ammonia was also measured. The analyses demonstrated that these ions are the main constituents of the particulate water-soluble fraction of the aerosols sampled. Ion balance studies showed that the main compounds present were (NH₄)₂SO₄, NH₄NO₃ and NH₄Cl in polluted aerosols and NaCl and MgCl₂ in maritime aerosols. Backward air mass trajectories for collected samples indicated that NH₄Cl is primarily produced locally, NH₄NO₃ has a local to medium-distance origin, and (NH₄)₂SO₄ has been transported over long distances. The observations were made in rural England. (30 refs.)
- 64169 Finite-amplitude stability of a zonal shear flow.** A.G.Burns, S.A.Maslowe (Dept. of Maths, McGill Univ., Montreal, Quebec, Canada). *J. Atmos. Sci. (USA)*, vol.40, no.1, p.3-9 (Jan. 1983). Considers the stability of a zonal shear flow $\bar{u}=\tanh y$ in the framework of the β -plane approximation. The objective of this study is to determine the effects of nonlinearity on the stability of the flow by perturbing about the known linear neutral solution obtained by Howard and Drazin and, independently, by Lipps. The procedure employed is a weakly nonlinear approach which leads to the familiar amplitude evolution equation of Stuart-Watson theory. The 'Landau constant', i.e. the coefficient of the nonlinear term, turns out to be positive. Thus, nonlinearity is found to be destabilizing. Despite the fact that the linear solution is regular, critical point singularities are encountered in all higher order terms of the perturbation streamfunction expansion. (15 refs.)
- 64170 On the predictability of quasi-geostrophic flow: the effects of beta and baroclinicity.** G.K.Vallis (Scripps Inst. of Oceanography, La Jolla, CA, USA). *J. Atmos. Sci. (USA)*, vol.40, no.1, p.10-27 (Jan. 1983). The equilibrium statistics and predictability properties of one-and two-layer quasi-geostrophic flow are examined with the aid of a numerical model. The effect of beta in one-layer flow is to slow the transfer of energy into larger scales and to increase the predictability. In two-layer flow, when beta is zero, energy enters the system via baroclinic instability of the mean flow at very large scales and most energy transfer is confined to low wavenumbers. When beta is nonzero, energy enters at higher wavenumbers (in baroclinic modes mainly) before cascading preferentially to lower wavenumber zonal barotropic modes. The predictability of two-layer flow is not significantly altered by beta, because beta increases the range of wavenumber over which significant nonlinear energy transfer occurs. The predictability times of the long waves are found to be always larger than those of the short waves, even when the initial error is spread evenly across wavenumbers. Reducing the mean baroclinicity increases the predictability time. (26 refs.)
- 64171 The amplification and capture of atmospheric solitons by topography: a theory of the onset of regional blocking.** T.Warn, B.Brasnett (Dept. of Meteorology, McGill Univ., Montreal, Quebec, Canada). *J. Atmos. Sci. (USA)*, vol.40, no.1, p.28-38 (Jan. 1983). The problem of long, quasi-geostrophic baroclinic waves interacting with topography is shown to reduce to an inhomogeneous, damped Korteweg-de Vries equation. The soliton perturbation theory of Karpmann and Maslow (1977, 1978) and Kaup and Newell (1978) is then used to examine the qualitative aspects of the interaction of travelling solitons with topography. The perturbation theory suggests and numerical experiments confirm that under certain conditions incident solitons can be simultaneously amplified and stalled by topography—a process which can be interpreted as a transition to a regional blocking configuration. (24 refs.)
- 64172 The role of latent heat release in baroclinic waves—without β -effect.** C.-M.Tang, G.H.Fichtl (Fluid Dynamics Branch, NASA/Marshall Space Flight Center, AL, USA). *J. Atmos. Sci. (USA)*, vol.40, no.1, p.53-72 (Jan. 1983). Develops the analytical theory of two-level quasi-geostrophic baroclinic waves without β -effect aimed at understanding the role of latent heat release on the development of baroclinic waves. When the release of latent heat is introduced with pseudo-adiabatic ascent and dry adiabatic descent, the width a of the ascending region is different from the width b of the descending region and, furthermore, a static stability-vertical velocity correlation results in the mean state thickness increasing with time. However, the basic state shear is defined a priori, independent of the perturbations, in the formulation of the stability problem. Integro-differential equations for the perturbations are developed. Due to the mass continuity constraint, the unstable waves in the dry and moist regions are stationary in a frame of reference which translates with the mean zonal wind at the middle level, and the growth rate in the moist region is equal to that in the dry region, the same as in the dry model. Latent heat release is shown to cause a significant change in the structure of the

waves such that large departure in the horizontal heat transport from dry atmospheric values can occur. (24 refs.)

64173 The evolution of a Rossby-wave packet in a three-dimensional baroclinic atmosphere. Q.-C.Zeng (Geophys. Fluid Dynamics Program, Princeton Univ., Princeton, NJ, USA).

J. Atmos. Sci. (USA), vol.40, no.1, p.73-84 (Jan. 1983).

The development of an individual quasi-geostrophic disturbance in a three-dimensional baroclinic atmosphere is investigated by using a wave-packet representation and the WKB method. The results obtained indicate that the development of a Rossby-wave packet in the upper level of the atmosphere depends on the packet's structure and location with respect to the zonal flow, whether the zonal flow is stable or not. The wave packet develops (decays) if the three-dimensional rays are directed up-gradient (down-gradient) in the zonal flow. All characteristics of the wave packet are changing with time. The spatial scale or the three-dimensional wavelength of the developing (decaying) wave packet increases (decreases). The maximum amplitude of the developing (decaying) Rossby-wave packet moves toward (out from) the jet region, if the zonal flow is stable. Unlike a single normal mode, most wave packets cause considerable divergence of momentum and heat flux; hence there exists strong interaction between a Rossby-wave packet and the zonal flow. (28 refs.)

64174 A conservation law for small-amplitude quasi-geostrophic disturbances on a zonally asymmetric basic flow. D.G.Andrews (Dept. of Atmospheric Phys., Univ. of Oxford, Oxford, England).

J. Atmos. Sci. (USA), vol.40, no.1, p.85-90 (Jan. 1983).

A quadratic conservation law is derived for small-amplitude quasi-geostrophic disturbances on a wavy basic state. The law may be useful for describing the three-dimensional propagation of disturbances on time-averaged flows. This parallels the use of the generalized Eliassen-Palm theorem in the description of waves propagating on zonally-averaged flows. (17 refs.)

64175 Simulations of nocturnal drainage flows by a q^2 turbulence closure model. T.Yamada (Los Alamos Nat. Lab., Los Alamos, NM, USA).

J. Atmos. Sci. (USA), vol.40, no.1, p.91-106 (Jan. 1983).

Nocturnal drainage flows observed over a nearly two-dimensional ridge called Rattlesnake Hills near Richland, Washington, are simulated by using a simplified turbulence closure model in which only turbulence kinetic energy and turbulence length scale equations are solved prognostically. The present model is slightly simpler than a level 2.5 model which has been extensively used in previous simulations of various atmospheric boundary layer phenomena. Wind and temperature profiles computed by the present model are generally in excellent agreement with observations made by towers erected on the slope of Rattlesnake Hills. Strong coupling between the mean and turbulence variables is also demonstrated. (28 refs.)

64176 Growth of aqueous solution droplets of HNO_3 and HCl in the atmosphere. P.V.N.Nair, P.V.Joshi, U.C.Mishra, K.G.Vohra (Div. of Radiological Protection, Bhabha Atomic Res. Centre, Bombay, India).

J. Atmos. Sci. (USA), vol.40, no.1, p.107-115 (Jan. 1983).

Computed values of equilibrium sizes and composition of uncharged and charged aqueous solution droplets of HNO_3 and HCl at 25°C , relative humidities from 5 to 101%, and solute vapor activities from 10^{-4} to 10^1 are presented. Threshold concentrations for heteromolecular nucleation of HNO_3 and HCl at 40, 30, 20, 10, 0, and -10°C are also given as a function of the relative humidity. It is shown that atmospheric concentrations of HNO_3 and HCl can participate in nucleation at temperatures below 20°C and relative humidities above 98%. The nature of the nucleation of HNO_3 and HCl in the atmosphere including ion-induced nucleation for which there is no threshold and some of the available experimental results are discussed. (28 refs.)

64177 A theoretical determination of the capture efficiency of small columnar ice crystals by large cloud drops. J.K.Lew, H.R.Pruppacher (Dept. of Atmospheric Sci., Univ. of California, Los Angeles, CA, USA).

J. Atmos. Sci. (USA), vol.40, no.1, p.139-45 (Jan. 1983).

A theoretical model has been formulated to study by numerical techniques the efficiency E with which columnar ice crystals grown at temperatures between -3 and -8°C are captured in a cloud by relatively large, supercooled cloud drops. The ice crystals studied had lengths L of $15 \leq L \leq 240$ μm and diameters D of $1.5 \leq D \leq 240$ μm , and L/D values of 1.0, 3.0 and 10.0. The specific gravity of the ice crystals was assumed to be 0.92 and 0.5 g cm^{-3} . The cloud drops had Reynolds numbers of 10, 30, 100, 200, 300 and 400, corresponding to the drop radii r_d of 100, 165, 300, 416, 510 and 591 μm in air at 900 mb and -6°C . A few computations were made for 500 mb and -10°C . The ice crystals were assumed to have three typical, yet fixed, orientations with respect to the drop, in an attempt to take into account, in an idealized manner, the different orientations a columnar ice crystal assumes as it moves around a falling drop. (19 refs.)

64178 Measured collection efficiencies for cloud drops. K.V.Beard, H.T.Ochs, III (Illinois State Water Survey, Champaign, IL, USA).

J. Atmos. Sci. (USA), vol.40, no.1, p.146-53 (Jan. 1983).

The collection efficiency has been measured for 15 size pairs of relatively uncharged drops in over 400 experimental runs. The results indicate that collection efficiencies fall in a narrow range of 0.60 to 0.70 even though the collector drop was varied between 63 and 100 μm radius and the collected drop from 11 to 26 μm radius. The measured values of collection efficiencies were consistently below collision efficiencies based on calculations using rigid sphere hydrodynamics. The coalescence efficiencies computed from the ratio of the theoretical collision efficiencies to the measured collection efficiencies were between 0.6 and 0.8. The data show fair agreement with previous coalescence model results. Grazing trajectory collisions are considered. (31 refs.)

64179 Homogeneous and isotropic turbulence on the sphere. G.J.Boer (Canadian Climate Centre, Downsview, Ontario, Canada).

J. Atmos. Sci. (USA), vol.40, no.1, p.154-63 (Jan. 1983).

The assumption that the streamfunction for two-dimensional nondivergent flow on the sphere is a homogeneous and isotropic random field is used to obtain a variety of results for the study of large-scale atmospheric turbulence. These results differ somewhat from those for Cartesian geometry. It is shown that the necessary and sufficient condition that the turbulent flow be homogeneous and isotropic is the statistical independence of the spherical harmonic expansion coefficients of the streamfunction and the dependence of the variance of the expansion coefficients only on the wavenumber n . The homogeneity and isotropy of the vorticity field and of the velocities along and perpendicular to the geodesic connecting points on the sphere follows. The usual zonal and meridional velocity components on the sphere are anisotropic although, at a point, these velocity components are uncorrelated and have equal amounts of kinetic energy. (19 refs.)

64180 Large-scale two-dimensional turbulence in the atmosphere. G.J.Boer, T.G.Shepherd (Canadian Climate Centre, Downsview, Ontario, Canada).

J. Atmos. Sci. (USA), vol.40, no.1, p.164-84 (Jan. 1983).

Global FGGE data are used to investigate several aspects of large-scale turbulence in the atmosphere. The approach follows that for two-dimensional,

nondivergent turbulent flows which are homogeneous and isotropic on the sphere. Spectra of kinetic energy, enstrophy and available potential energy are obtained for both the stationary and transient parts of the flow. Nonlinear interaction terms and fluxes of energy and enstrophy through wavenumber space are calculated and compared with the theory. A possible method of parameterizing the interactions with unresolved scales is considered. Two rather different flow regimes are found in wavenumber space. The high-wavenumber regime is dominated by the transient components of the flow and exhibits, at least approximately, several of the conditions characterizing homogeneous and isotropic turbulence. This region of wavenumber space also displays some of the features of an enstrophy-cascading inertial subrange. (26 refs.)

64181 Hail growth in a three-dimensional cloud model. J.-L.Xu (Nat. Center for Atmospheric Res., Boulder, CO, USA).

J. Atmos. Sci. (USA), vol.40, no.1, p.185-203 (Jan. 1983).

A hailstone growth model is developed. The changes in hailstone density due to varying riming densities are considered. The contributions of evaporation to melting as well as wet growth (which cannot be neglected when the cloud temperature is approximately 0°C) are taken into account. A detailed heat balance equation is used in calculating the surface temperature of the hailstone. Detailed terminal velocity equations are applied in this model. Data of air velocities, liquid water contents, and temperature were obtained from the three-dimensional dynamic model developed by Clark. Embryos were released at each point in a subgrid of $21 \times 22 \times 17$ grid points within the dynamic model domain. Seven runs were made with various parameters: embryo radii of 0.10, 0.20 and 0.25 μm ; embryo densities of 0.4×10^3 and 0.9×10^3 kg m^{-3} ; and cloud droplet concentrations of 500 and 10^6 and 1000×10^6 m^{-3} . (33 refs.)

64182 A relationship between hailstone concentration and size. L.Cheng, M.English (Alberta Res. Council, Edmonton, Alberta, Canada).

J. Atmos. Sci. (USA), vol.40, no.1, p.204-13 (Jan. 1983).

Hailstone size distributions have been determined from 41 time-resolved hailstone samples collected at the ground from seven storms that occurred in Alberta in the summer of 1980. Most size distributions were found to quite closely fit an exponential function of the form $n(D) = n_0 e^{-\lambda D}$. In studying variations in n_0 and λ , it was found that a relationship exists between the two. In particular, correlation coefficients of ~ -0.9 were found when least-squares linear regressions were fitted to the values of $\log n_0$ versus $\log \lambda$. For Alberta storms, therefore, n_0 can be expressed in terms of λ as $n_0 = 115 \lambda^{3.63}$, and hail size distributions can be expressed in terms of the single parameter λ as $n(D) = 115 \lambda^{3.63} e^{-\lambda D}$. From an examination of hail size distributions from one storm that occurred in Switzerland, it appears likely that similar relationships can be determined for hailstorms from other regions. (21 refs.)

64183 Theory of equilibrium temperatures in radiative-turbulent atmospheres. K.-N.Liou, S.-C.S.Ou (Dept. of Meteorology, Univ. of Utah, Salt Lake City, UT, USA).

J. Atmos. Sci. (USA), vol.40, no.1, p.214-29 (Jan. 1983).

A thermodynamic model has been developed for the determination of the temperature profile based on the balance of radiative and turbulent fluxes. In the context of a one-dimensional case, it is shown that the temperature field is governed by a first-order differential-integro equation involving temperature to the fourth power. In conjunction with the temperature profile determination, parameterization programs for the transfer of broadband thermal infrared and solar fluxes in inhomogeneous atmospheres are developed. In addition, the vertical transport is parameterized using a first-order closure scheme with the eddy thermal diffusion coefficients derived from known theories or from available data. By virtue of an efficient perturbation technique devised for the solution of the thermal equilibrium temperature, it is shown that the simulated temperatures compare well with those of a standard atmosphere employing climatological water vapor, ozone and cloud profiles. Simulations using the steady-state one-dimensional model also reveal that high clouds will produce warming everywhere in the atmosphere whereas middle and low clouds will generate cooling as noted by several previous investigators. (34 refs.)

64184 Some improvements and complements to the infrared emissivity algorithm including a parameterization of the absorption in the continuum region. L.Garand (Recherche en Prevision Numerique, Dorval, Quebec, Canada).

J. Atmos. Sci. (USA), vol.40, no.1, p.230-44 (Jan. 1983).

Infrared heating rate calculations with the emissivity formulation are improved by developing simple methods to minimize the effects of the two main sources of error: 1) the use of the strong-line approximation; 2) the neglect of temperature variations along the optical path. When compared to band-by-band calculations, the resulting new scheme maintains a 5% accuracy on cooling rates, and errors generally less than 2 W m^{-2} on fluxes. The most recent band parameters of McClatchey et al. (1973) are used in the band-by-band calculations, including measured data for the vibration-rotation bands. Another novel aspect of the new scheme is the treatment of 'e-type' absorption, which is a very important effect in hot humid air near the ground. An implicit parameterization is developed which allows for 'e-type' absorption in the pre-tabulated transmission functions, and so requires no computational overhead. (20 refs.)

64185 Stationary waves in the winter stratosphere: seasonal and interannual variability. A.K.Smith (Geophys. Program, Univ. of Washington, Seattle, WA, USA).

J. Atmos. Sci. (USA), vol.40, no.1, p.245-61 (Jan. 1983).

Monthly average satellite and conventional data are used to determine the zonal mean wind and stationary waves 1 and 2 in the northern winter stratosphere for January 1973 through February 1977. Wave propagation is diagnosed with the aid of the Eliassen-Palm flux and the refractive index squared. Interannual variability in zonal mean wind and stationary wave amplitudes is greatest during the second half of winter (January-March), partially as a consequence of the irregular occurrence of major sudden warmings during those months. Both the seasonal trend and the interannual variability of the amplitude of wave 1 reflect variations in zonal mean wind, and the corresponding refractive index. The wave 1 amplitude maximum in the upper stratosphere occurs on the cyclonic side of the zonal jet, and its variability during mid-winter months is controlled primarily by refractive index variations associated with variations in the meridional curvature of the wind profile. During each year studied, a mid-winter minimum in wave 1 amplitude occurs at and above 1 mb as a consequence of a mid-winter curvature maximum. (40 refs.)

64186 Baroclinic instability of the summer mesosphere: a mechanism for the quasi-two-day wave? R.A.Plumb (CSIRO Div. of Atmospheric Phys., Aspendale, Australia).

J. Atmos. Sci. (USA), vol.40, no.1, p.262-70 (Jan. 1983).

Observations of the 'quasi-two-day' wave are reviewed and it is concluded that the weight of evidence indicates that the wave is a solstitial phenomenon, with maximum amplitudes in low latitudes of the summer mesosphere. It is

suggested that the properties of this wave and of a similar wave found in a numerical model of the middle atmosphere may be consistent with an origin via baroclinic instability of the easterly jet in the summer mesosphere. This suggestion is supported by the results of a stability analysis of a one-dimensional model of the summer mesospheric flow. (36 refs.)

64187 VHF radar observations in the stratosphere and mesosphere during a stratospheric warming. R.Rutser, P.Czechowsky, G.Schmidt (Max-Planck-Inst. für Aeronomie, Katlenburg-Lindau, Germany), K.Labitzke, J. Atmos. & Terr. Phys. (GB), vol.45, no.2-3, p.161-8 (Feb.-March 1983). For the first time the SOUSY-VHF-Radar (lat. 52°N, long. 10°E, Germany) was used to carry out measurements during a minor and major stratospheric warming in February and March 1980, respectively. Echoes have been received from the stratosphere up to an altitude of about 30 km continuously during day and night, whereas echoes from the mesosphere were restricted to the daytime and occurred sporadically at different heights within the altitude range from 60 to 90 km. The three-dimensional velocity vector has been derived from Doppler measurements made in three different antenna beam directions with a height resolution of 1.5 km. The resulting variation in height and time of the observed stratospheric and mesospheric wind speed and direction is discussed with respect to the stratospheric warming and compared with results obtained during undisturbed conditions. (11 refs.)

64188 Experiment of artificial lightning triggered with rocket. K.Horii (Dept. of Electrical Engng., Nagoya Univ., Nagoya, Japan). Mem. Fac. Eng. Nagoya Univ. (Japan), vol.34, no.1, p.77-112 (May 1982). In English. [received: March 1983] Experiments on artificial lightning triggered with a rocket pulling up a grounded wire has been carried out. The purposes of this experiment were to investigate the mechanism of the lightning discharge including predischARGE phenomena, and to develop a technique for protection from the hazards of lightning discharges. Though lightning has not been triggered in summer, 32 lightning flashes were triggered in winter at Hokuiriku, the north coast of Japan. The peak value and the duration of the discharge current, the electric field intensity at the ground, the altitude of the rocket, and other variables were measured, and relations between them discussed. The mechanism of lightning discharge was made clear from optical observations and the measurement of currents. Long gap discharges between bobbins in air and the ground were successfully performed three times. The surge voltages induced on power lines were measured and the shielding effect of the overhead grounded wire to the test line was confirmed. (18 refs.)

64189 Global distribution and southern hemispheric trends of atmospheric CCl₃F. P.J.Fraser, P.Hyson, I.G.Enting, G.I.Pearman (Div. of Atmospheric Phys., CSIRO, Aspendale, Victoria, Australia). Nature (GB), vol.302, no.5910, p.692-5 (21 April 1983). The spatial and temporal variability of the tropospherically inert tracer, trichlorofluoromethane (CCl₃F), has been simulated using a global atmospheric transport scheme and known release and photolytic data. The observational data are taken from the Geophysical Monitoring for Climatic Change (GMCC) global network, from the Pacific north-west (PNW) USA and South Pole, and from the CSIRO southern hemispheric stations at Cape Grim, Tasmania, and Mawson, Antarctica. A current CCl₃F atmospheric lifetime of 75 yr is obtained. The observations suggest that small, residual errors may exist in the CCl₃F release data. (25 refs.)

64190 Solar irradiance study. A.Pons, A.Corrans (Inst. de Optica, Madrid, Spain). Opt. Pura & Apl. (Spain), vol.15, no.3, p.119-28 (1982). In French. A new kind of solar radiometer has been constructed for the continuous measurement of solar irradiance. Using the experimental measurements, a theoretical expression is proposed as closer to real direct solar spectral irradiance in Madrid, on clear days. The experimental data also provide information on the content and size distribution of atmospheric aerosols at the time of measurements. (21 refs.)

64191 Solar radiation values received on a horizontal surface in Spain. F.Tena, D.Tinaut, A.Casanovas (Facultad de Fisicas, Univ. de Valencia, Valencia, Spain). Opt. Pura & Apl. (Spain), vol.15, no.3, p.129-42 (1982). In French. Employing linear correlations between measured values of insolation and solar irradiation, there have been deduced for a period of about 20 years the solar radiation values for 73 different places of the Peninsular part of Spain. Also the maximum and minimum values have been deduced for such a period, evaluating the total dispersions, and the mean deviations. In this way an estimation of future perspectives is possible. (9 refs.)

64192 Dynamics of the atmospheric boundary layer during the 1980 total solar eclipse. S.Sethu Raman (Atmospheric Sci. Div., Brookhaven Nat. Lab., Upton; NY, USA). Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.187-95 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

An atmospheric boundary layer experiment was conducted at Raichur, India, to study the variations in the surface shear stress, heat flux and the meteorological processes that take place during a total solar eclipse. Interesting results were observed regarding the evolution of the planetary boundary layer. Changes in atmospheric stability from unstable to stable to unstable were observed during different phases of the eclipse. Downward propagation of negative heat flux associated with decreasing scales of convective eddies was also observed during the eclipse. (2 refs.)

64193 Total solar eclipse of 16 February 1980 and the vertical profiles of atmospheric parameters in the lowest 200 m. V.Ramesh Babu, J.S.Sastry (Nat. Inst. of Oceanography, Goa, India). Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.196-201 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

Vertical profiles of air temperature, wind and humidity at Raichur, India (16°12' and 77°21'E), in the lowest 200 m of the atmosphere are presented for the period 15-18 February 1980. The effect of the total solar eclipse on 16 February 1980 is seen in the lowering of air temperature in the entire air column. This effect persisted for a few hours. (2 refs.)

64194 Meteorological parameters near the Earth's surface along the path of totality during the total solar eclipse of 16 February 1980. S.K.Das, S.M.Kulshrestha, K.Chatterjee, C.K.Chanderasekharan (India Meteorological Dept., Instruments Div., New Delhi, India). Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.202-8 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

The instruments divisions at New Delhi and Pune of the India Meteorological Department planned an exhaustive programme to take frequent dry bulb and wet bulb temperature measurements at 14 observatories, including experimental stations at Gadag and Raichur, along the path of totality on 15, 16 and 17 February, 1980. The frequency of observations was stepped up between

1530 and 1630 IST when readings were taken at 2 minutes interval. These measurements taken at the 14 observatories have been analysed. Soil surface temperatures recorded at Gadag on 15, 16 and 17 February 1980 have also been plotted, analysed and presented. Sunshine duration record of 16 February 1980 of Gadag has also been discussed in the paper. (no refs.)

64195 Solar eclipse of 16 February, 1980—its effect on meteorological parameters. K.Mohanakumar, S.Devanarayanan (Dept. of Phys., Univ. of Kerala, Trivandrum, India). Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.209-16 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

A study of the meteorological parameters across the penumbral and umbral regions during the 16 February 1980 Indian total solar eclipse has been made. Surface pressure, air temperature, soil surface temperature and relative humidity measurements made at Trivandrum, which had 80 per cent obscuration, Hyderabad which was almost in the totality path, Calcutta which had 96 per cent obscuration and New Delhi 65 per cent eclipse are discussed. It was found that the surface pressure was not much affected by the eclipse. The air temperature measured at a height of 1.2 m above the ground showed a decrease of 2.8°C at Trivandrum, 3.1°C in Calcutta and 2.7°C at Hyderabad. Soil surface temperature fell by 16.3°C at Trivandrum on the eclipse day. An increase in relative humidity was found as the eclipse advanced, reaching the highest value just after the final contact. (8 refs.)

64196 Measurements of meteorological parameters at the lowest layers of the atmosphere during total solar eclipse of 1980. R.K.Kankane, B.K.Hazra, A.B.Sarkar (Meteorological Office, Pune, India). Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.217-23 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

Observations of various meteorological parameters, viz. wind speed, wind direction at two levels 3.0 and 13.5 m, air temperature at four levels 0.3, 3.0, 6.5 and 13.5 m, soil surface temperature and atmospheric pressure were made at Raichur (77°21'E, 16°12'N) during the total solar eclipse of 16 February 1980. Sensitive photo-electric anemometers and potentiometric windvanes were used for measuring wind speed and direction, sensitive linear bead thermistors were used for measuring temperature, a differential capacitor transducer was used for the measurement of atmospheric pressure. The above parameters were continuously and automatically recorded on strip chart recorders. (2 refs.)

64197 A study of change in the atmospheric properties during solar eclipse of 16 February 1980. R.K.Kapoor, B.B.Adiga (Health Phys. Div., Bhabha Atomic Res. Centre, Bombay, India), S.P.Singal, S.K.Agarwal, B.S.Gera. Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.224-33 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

Monostatic sodar and a number of meteorological sensors were used to study variations in the atmospheric boundary layer at Delhi (28°6'N, 77°2'E) and Tarapur (19°50'N, 72°41'E) during the solar eclipse of 16 February 1980. The atmospheric instability (atmospheric mixing and turbulence) and solar UV component were found to have been reduced below normal values during the solar eclipse period. The atmosphere at no time became stable and the sodar echograms did not show the presence of wave motion (undulations) before, during or after the solar eclipse at either of the two places. (5 refs.)

64198 Radiometric observations of solar eclipse over New Delhi on 16 February 1980. M.K.Raina, G.S.Uppal, R.Chadha (Radio Sci. Div., Nat. Phys. Lab., New Delhi, India). Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.234-7 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

A study has been made of the effect of the solar eclipse of 16 February 1980 on solar microwaves at 11 GHz and atmospheric water vapour measurements at 22.235 GHz. Radiometers at 11 GHz in the absorption mode and 22.235 GHz in the emission mode were operating simultaneously at the National Physical Laboratory, New Delhi. As the eclipse progressed in its path, a fall in the microwave emission from the Sun was observed. At the time when there was maximum obscuration over New Delhi, a fall of 6 dB was observed. On the other hand, the water vapour measurements by another Radiometer at 22.235 GHz working in the emission mode and looking at the zenith showed a marginal increase of around 10 to 15K over the sky level during the period of eclipse. (4 refs.)

64199 Atmospheric pressure perturbations during total solar eclipse on 16 February 1980. P.K.Kunhikrishnan, B.V.Krishna Murthy (Space Phys. Div., Vikram Sarabhai Space Centre, Trivandrum, India). Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.238-53 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

Pressure variations recorded at three stations situated in the penumbral region during the total solar eclipse on 16 February 1980 have been analysed to study eclipse induced effects, if any. By statistical analysis, it has been established that the eclipse has produced pressure perturbations observable at the ground level. (11 refs.)

64200 Boundary layer studies conducted at Gadag during the total solar eclipse of 16 February 1980. K.Chatterjee, C.K.Chandrasekharan, V.P.Verma (Instruments Div., India Meteorological Dept., New Delhi, India). Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.254-9 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

Special meteorological observations during the period covering total solar eclipse of 16 February 1980 were arranged at Gadag (Lat. 15°24'N, Long. 75°38'E) which lay in the path of totality of the eclipse to study the changes occurring in the lower boundary layer. Wind speed, wind direction, temperature and humidity instruments were installed on a micro meteorological tower at four levels 1.2 m, 3.3 m, 6.5 m and 13.5 m meter above ground and the observations were continuously recorded on strip chart recorders. (no refs.)

64201 Variations in atmospheric electrical parameters during solar eclipse. S.Nizamuddin, R.Ramanadham, A.M.Rao (Dept. of Meteorology & Oceanography, Andhra Univ., Waltair, India), M.K.Khera, B.A.Makhdomi, A.R.Rafiqi, B.N.Raina, V.Reddy Mukku, R.K.Goel, P.P.Pathak, J.Rai, N.C.Varshneya. Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.263-70 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

Results of solar eclipse observations conducted at Nagarampalam near Vishakhapatnam ($\lambda=7.723^\circ\text{N}$, $\phi=148.65^\circ\text{E}$ geomagnetic) are presented. Observed variations in atmospheric conductivities, potential gradient, and air Earth current are explained by correlating them with the variations in the solar wind flux on the Earth (as a result of eclipse by the Moon) and the resulting change in atmospheric ionization. Observations by previous workers, of a different pattern of variation in conductivity during solar eclipse at high

latitudes, have also been explained on the same theoretical basis. While there are marked solar eclipse changes in atmospheric electrical parameters, no definite effects on meteorological parameters have been observed. (6 refs.)

64202 Measurements of atmospheric electricity parameters during the total eclipse of 16 February 1980. G.P.Srivastava, V.Srinivasan, A.K.De (Instruments Div., Meteorological Office, Pune, India).

Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.271-9 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

Continuous recordings of atmospheric potential gradient, polar conductivities and positive and negative ion densities were made close to the ground during the total solar eclipse of 16 February 1980 at Raichur, India ($72^{\circ}21'E$, $16^{\circ}12'N$). Measurements of positive and negative electrical conductivities were also made on a 15 m high tower simultaneously. A few low level potential gradient soundings were made close to the eclipse time to study the vertical distribution of potential gradient at lower troposphere. The results are compared with the measurements taken two days before and two days after the eclipse. The instruments used are described. (4 refs.)

64203 Variation in solar energy intensity during total solar eclipse of 16 February 1980. U.K.Chaturvedi, S.K.Agrawal, N.Rajan, R.Bhanja, A.K.Nigam (Dept. of Phys., Banaras Hindu Univ., Varanasi, India).

Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.280-3 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

All the solar energy trapping systems become inactive in a belt hundreds of kilometers wide for a period of hours during a total solar eclipse. This inspired the authors to measure the changes in the intensity of the sunlight during the total solar eclipse of 16 February 1980 at Puri (India). Puri is situated at $19.85^{\circ}N$, $85.80^{\circ}E$. It was only 10 km north to the middle line of the totality path of the eclipse. The intensity of the sunlight during the eclipse was measured by a CEL Suryamapi. The intensity of the sunlight at Puri sea beach decreased from 76 mW cm^{-2} to 0.01 mW cm^{-2} at the peak of totality. The temperature of the environment at the site was also measured by a sensitive alcohol thermometer. The temperature variation from $29^{\circ}C$ to $24^{\circ}C$ was observed during the same period. The sea became more violent and the wind velocity increased significantly during the total solar eclipse. (1 ref.)

64204 Determination of ozone from eclipse observations of $O_3(a^1\Delta_g)$ dayglow. V.V.Agashe, S.M.Rathi (Dept. of Phys., Univ. of Poona, Pune, India).

Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.284-92 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

Observations of 1270 nm dayglow radiance of molecular oxygen during the total solar eclipse of 16 February 1980 have been described. Rate equations for production and loss of $O_3(a^1\Delta_g)$ have been used together with observed data to examine the changes in the concentration of ozone during the eclipse. It is found that ozone concentrations increased during the eclipse. At 66 km altitude, the ozone concentration increased by more than a factor of two at the mid-eclipse time over its prevailing value at first contact. (18 refs.)

64205 VLF/LF detection of ionization changes and wave motions in the middle atmosphere associated with the February 1980 total solar eclipse. Y.V.Ramanamurthy, S.C.Garg, M.V.S.N.Prasad, A.Hamid (Nat. Phys. Lab., New Delhi, India).

Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.293-301 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

Based on VLF/LF radio observations, the first evidence of wave motions in the middle atmosphere associated with the total solar eclipse of 16 February 1980 is presented. The ionospheric effect on 16 kHz radiowaves monitored at New Delhi (path mid point $47.4^{\circ}N$, $29.6^{\circ}E$) manifested itself as a precursor corresponding to a decrease followed by the main increase in height of reflection because of loss of electrons due to recombination in the partially eclipsed lower D-region. Succeeding this main effect, there was a phase overshoot due to rather complex aeronomical processes. Soon after the appearance of the precursor, small periodic fluctuations in the phase are observed. The VLF paths (12.8 kHz, La Reunion-New Delhi; 12.3 kHz, Tsushima Island-New Delhi) crossing the path of totality showed larger phase retardations compared to the 16 kHz Rugby-New Delhi path which is far away from the path of totality. (23 refs.)

64206 Atmospheric gravity waves produced by solar eclipses—a review. K.Davies (Nat. Sci. Found., Washington DC, USA).

Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.342-55 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

Reviews the theoretical and experimental bases for gravity wave production resulting from cooling produced by the Moon's shadow. Theoretically, it is reasonable to expect waves from the low shock after propagation in a dispersive and anisotropic atmosphere and that focusing should be expected from the eclipse geometry. Experimental evidence from the eclipses of 7 March 1970 in North America, 30 June 1973 in Africa and 23 October 1976 in Australia leave doubts as to whether such waves have been observed. (40 refs.)

64207 Evidence of atmospheric gravity waves in the wake of the eclipse shadow. R.Venkatachari, A.K.Saha, C.V.Subrahmanyam (Radio Sci. Div., Nat. Phys. Lab., New Delhi, India), S.K.Chatterjee.

Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.370-4 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

An attempt was made to obtain evidence of atmospheric gravity waves at ground level and at ionospheric height during the total solar eclipse of 16 February 1980. The observations were made with two microbarographs located at Hyderabad (maximum obscuration 99 per cent) and at Delhi (65 per cent), a 10 MHz Dopplometer located at Calcutta receiving ATA, Delhi and an ionosonde at Delhi. Wavelike disturbances could be distinguished in the Hyderabad microbarograph and in the Dopplometer records that would tend to suggest that gravity waves were originating from the region of totality. No clear evidence of wave motion could be detected at Delhi on the microbarographs or in the ionograms. (10 refs.)

64208 Infrared visibility prediction by statistical methods. A.Court, G.-Y.Lin, S.Zetsche (California State Univ., Northridge, CA, USA).

Pure & Appl. Geophys. (Switzerland), vol.120, no.2, p.203-10 (1982).

This study attempts to find statistical methods of predicting infrared visibility (IRV), as calculated from hourly meteorological observations from a North Atlantic weather ship. Simple and multiple regressions expressing IRV as a function of its component weather variables, and exponential data transformations, for time lags of 1 to 24 hours, gave R^2 values from 0.68 (1-hour lag) to 0.09 (24-hour lag). These have limited predictive power for lags up to 6 hours, almost none for longer lags. Two-category discriminant analysis, using class breaks at 2 km or 10 km is of little use, due to uneven data distribution. Possibly more promising would be an application of Machine

Output Statistics ('MOS'), used routinely for temperature forecasts, to this problem. (3 refs.)

64209 A study of energy conversion in the wave number domain. U.S.Singh (Dept. of Geophys., Banaras Hindu Univ., Varanasi, India).

Pure & Appl. Geophys. (Switzerland), vol.120, no.2, p.211-17 (1982). Energy conversions from potential to kinetic energy have been studied for a part of the Northern Hemisphere in the wave number domain. The vertical distribution of energy conversions were examined and the results have been compared with the other's observational results as well as that of forecast models. (15 refs.)

64210 A study of energy, generation and conversion over North America. U.S.Singh (Dept. of Geophys., Banaras Hindu Univ., Varanasi, India).

Pure & Appl. Geophys. (Switzerland), vol.120, no.2, p.218-28 (1982). The energy conversion between potential and kinetic energy and the generation of available potential energy are computed over North America. The relative contribution from each latitude belt within the region, for each field, have been discussed. (19 refs.)

64211 Meridional transport of sensible heat in contrasting monsoon activity: spherical harmonic analysis. S.T.Awade, S.M.Bawiskar (Indian Inst. of Tropical Meteorology, Pune, India).

Pure & Appl. Geophys. (Switzerland), vol.120, no.2, p.229-48 (1982).

A spherical harmonic analysis is made of the grid point values of geopotential heights at 700 mb and 300 mb levels for the months of April to August for the years 1967 and 1972. The year 1967 is a good monsoon year and 1972 is bad monsoon year in India. Meridional transport of sensible heat is obtained in wave number domain using spherical harmonic coefficient at the 500 mb level for $m=1$ to 10 and $n=m=0$ to 10, where m represents the wave number round the globe and $n-m$ gives the numbers of zero points from north pole to south pole excluding the poles themselves. Large northward transports of sensible heat in the month of May and in the monsoon months at the subtropics are characteristics of bad monsoons. Wave 1 transports sensible heat southward (for $n-m=0$) and wave 2 transports sensible heat northward (for $n-m=4$). Strengthening of wave 1 is conducive to good monsoon year and strengthening of wave 2 is conducive to bad monsoon year. (19 refs.)

64212 Correlation functions of rainfall field and their application in network design in the tropics. D.A.Mooley, P.M.Mohamed Ismail (Indian Inst. of Tropical Meteorology, Pune, India).

Pure & Appl. Geophys. (Switzerland), vol.120, no.2, p.249-60 (1982).

The study examines the correlation function of tropical monsoon rainfall on monthly, seasonal and annual time scales and obtains the relationship between this function and the distance. The area selected for study is Vidarbha with a fairly dense network of rain gauges. Vidarbha is a meteorological sub-division of the state of Maharashtra in India. Utilizing the relationship between the correlation function of the rainfall field and the distance, the errors of optimum interpolation of rainfall at a point have been computed by applying the method of optimum interpolation by Gandin (1970). Relationships between rain gauges for a specified tolerable error in interpolation has been estimated for each of the periods. (10 refs.)

64213 Areal extent and vertical structure of radar weather echoes at Montreal. R.R.Rogers, M.K.Yau (Dept. of Meteorology, McGill Univ., Montreal, Quebec, Canada).

Pure & Appl. Geophys. (Switzerland), vol.120, no.2, p.273-85 (1982).

A large sample of radar data from the period May-August 1976 was analyzed provide information on the total area coverage of precipitation echoes at 1-km steps in altitude ranging from 2 km up to 10 km. A transformation based on known statistics of surface rainfall rate was employed to express this information in terms of the probability of certain reflectivities being exceeded at a randomly chosen point at a given altitude. The same data base was used to construct a family of average vertical profiles of precipitain reflectivity. The profiles were conditioned by the reflectivity value at the lowest level (2 km), thus providing a basis for estimating the reflectivity aloft, given the low level of surface rainfall rate. (15 refs.)

64214 The removal of particulate matter from the atmosphere: the physical mechanisms. F.Prodi (Osservatorio Geofisico, Univ. di Modena, Modena, Italy), F.Tampieri.

Pure & Appl. Geophys. (Switzerland), vol.120, no.2, p.286-325 (1982).

The removal of particulate matter from the atmosphere has been examined in the light of the physical mechanisms involved, with a view of the theoretical and experimental results available in the literature. While the wet and dry removal are usually separately discussed, it has been decided to give evidence of the fundamental mechanisms which are active in both processes. A number of them, such as the inertial impaction, the phoretic and electrostatic collection, can be expressed through the equation of motion of the individual particle. Other mechanisms, such as Brownian and turbulent deposition, and incorporation by nucleation, require a description in terms of the behaviour of a population of particles. Finally, the problem of the superposition of the different mechanisms in the actual removal processes is considered. (56 refs.)

64215 Comparison between the results of a one-dimensional model and those of stratospheric measurements for CH_4 , H_2O and nitrogen oxides. R.Borghi (Office Nat. d'Etudes et de Recherches Aérospatiales, Chatillon, France), D.Cariolle, A.Girard, J.Laurent, N.Louisnard.

Rev. Phys. Appl. (France), vol.18, no.4, p.229-37 (April 1983).

Simultaneous measurements of stratospheric trace gases have been obtained by infrared absorption spectrometry at sunset and sunrise. They are compared with the results of a 1-D photochemical model. This comparison points out: for water vapour marked discrepancies between some measured profiles and the profile of the 1-D model; the observed variations are, at least partly, due to horizontal transport and cannot be explained by this model; a good agreement between measured and calculated vertical column abundance of NO_2 at sunset and sunrise. (17 refs.)

64216 Aerosol mode of ball lightning. V.Ya.Aleksandrov, E.M.Golubev, I.V.Podmoshenskii.

Sov. Phys.-Tech. Phys. (USA), vol.27, no.10, p.1221-4 (Oct. 1982). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.52, no.10, p.1987-92 (Oct. 1982). [received: April 1983]

A model is proposed for ball lightning in which the active material is in a condensed state consisting of three-dimensional filamentary structures suspended in air. The submicron filaments are built up by the action of the electric field from charged particles and droplets formed in corona shells in linear lightning channels and are capable of participating in oxidation reactions. Reactions are assumed to be initiated by microscopic discharges during neutralization of various types of charged particles. The model gives a satisfactory explanation for the basic properties of ball lightning (why its shape remains constant, how it moves, how much energy it contains) and accounts for various mechanisms by which the energy is dissipated. (14 refs.)

- 64217 48- and 60-hour surface air temperature forecasting.** A.I.Snitkovskii (Hydrometeorological Sci. Res. Center, USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.12, p.1-7 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.12, p.5-13 (1981).
A procedure for forecasting temperature lows 48 hours ahead and temperature highs 60 hours ahead on the basis of the model output statistics (MOS) concept with the aid of regression equations is proposed. (2 refs.)
- 64218 Relation between time and space intervals in numerical weather forecasting.** V.M.Kadyshnikov, V.M.Ryazantseva (Hydrometeorological Sci. Res. Center, USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.12, p.8-16 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.12, p.14-24 (1981).
The wave energy propagation velocity is part of Courant's criterion, which links the time and space steps in explicit forecasting schemes. It is shown that in a polytropic hydrostatic atmosphere, the horizontal velocity of the baroclinic case is near the corresponding barotropic value, and that wave energy does not propagate vertically. Therefore, the time step depends only on the horizontal resolution of the model. Its independence of the vertical resolution is also confirmed by calculations. (9 refs.)
- 64219 Friction and heat exchange between air and surface in the presence of sand, salt, and ice-particle transport.** O.K.Zakharova (State Hydrological Inst., USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.12, p.26-9 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.12, p.36-40 (1981).
Relationships are obtained for the heat transfer and drag coefficients on a level two meters above the surface by solving a system of equations of motion and heat combustion with terms that describe the presence of saltating sand, salt, and ice particles $3\text{--}6 \times 10^{-4}$ meters in diameter in the air stream. These coefficients increase with wind velocity and are approximately twice as large in moderate winds and three times as large in a hurricane as compared to the case in which the air stream does not transport particles. (5 refs.)
- 64220 Radiation modification of turbulent clouds.** R.Kh.Almaev, L.P.Semenov (Inst. of Experimental Meteorology, USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.12, p.34-41 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.12, p.46-55 (1981).
The intensity fluctuations of modifying layer radiation that occur during dispersal of turbulent clouds are investigated. Expressions for the fluctuation variance of intensity level are obtained in the geometric-optics approximation by the method of smooth perturbations. It is shown that fluctuations of the real and imaginary dielectric-constant components of the medium being dispersed partially offset the intensity fluctuations. The profile changes of the average characteristics of the cloud medium being dispersed that result from saturations of the radiation acting on the medium are calculated. (10 refs.)
- 64221 Aspects of mass transfer in collisions of water drops of noncomparable size.** S.M.Kontush, A.V.Kolpakov (Odessa State Univ., Odessa, USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.12, p.42-6 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.12, p.56-60 (1981).
An experimental procedure for the study of the phenomenon of partial coalescence of colliding drops is described, and results of experiments are reported. The experiments were performed with drops having radii 50 to 150 microns, which collided with target drops with radii 500 to 1500 microns, with the velocity varying in the range 20 to 200 cm/sec. Functional relationships linking the parameters of the drops before and after the collisions are obtained and the partial-coalescence mechanism is clarified. (12 refs.)
- 64222 Calculation of vertical turbulent heat fluxes in the marine atmospheric surface layer of tropical latitudes.** T.F.Masagutov (Inst. of Experimental Meteorology, USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.12, p.47-53 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.12, p.61-8 (1981).
A relationship for the energy-exchange coefficients as functions of flow characteristics and the roughness of the sea surface is derived in explicit form from analysis of observational data on the structure of turbulence in the marine atmospheric surface layer that were obtained in GATE-69, BOMEX-69, and GATE-74 and on several other expeditions. The results are used to construct an improved scheme for calculation of heat, moisture, and momentum fluxes from the results of standard meteorological observations. (23 refs.)
- 64223 Year-to-year variations of Northern hemisphere zonal atmospheric circulation over a five-year period.** G.E.Vaindiner, T.L.Mukhina, V.P.Gladilina, L.L.Kazakova (Hydrometeorological Sci. Res. Center, USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.12, p.80-2 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.12, p.102-4 (1981).
The variations of the zonal atmospheric circulation intensity in the Northern Hemisphere during the period from 1 January 1976 through 31 March 1981 are analyzed. Daily values of the zonal circulation indices on the 700 and 500 mb pressure surfaces in the North hemisphere were used as initial data. The results may be of interest for explanation of certain weather phenomena. (8 refs.)
- 64224 Use of probability methods to investigate the rate of Northern Hemisphere westerly air transport.** G.V.Gruza, V.T.Radyukhin (All Union Sci. Res. Inst. of Hydrometeorological Information World Data Center, USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.1, p.1-9 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.1, p.5-15 (1982).
The temporal succession of westerly air transport intensities in the Northern Hemisphere as characterized by the daily values of Blinova's circulation index (CI) at the 500 mb level is analyzed. It is shown that the statistically significant coupling between successive CI values vanishes after seven days in winter and after four days in summer. (17 refs.)
- 64225 The dynamics of the nonstationary atmospheric front.** G.I.Shapiro (Inst. of Oceanology, Acad. of Sci., USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.1, p.10-16 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.1, p.16-23 (1982).
A three-dimensional nonstationary hydrodynamic model of an atmospheric front is proposed in the approximation of a two-layer stratified, viscous, incompressible rotating fluid. The simplifications used are a small angle of inclination of the frontal surface to the horizon and a small inertial force in the momentum balance equation. An equation that describes the evolution of the frontal surface is derived and analyzed. (10 refs.)
- 64226 Mesoscale structure of an occluded front over the center of the European USSR from special measurements.** B.M.Matkovskii, N.P.Shakina (Inst. of Experimental Meteorology, USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.1, p.17-24 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.1, p.24-33 (1982).
Rawinsonde and aircraft sounding data and high meteorological mast measurements are used to analyze the mesoscale structure of an autumn occluded frontal system over the center of the European USSR. Typical features of mesoscale occlusion structure are designated. The distribution of

the heat and moisture fluxes in the lower 300 meters of the atmosphere is discussed. (13 refs.)

- 64227 Two classes of low-variance schemes of solution of the advection equation.** E.E.Kalenkovich, I.V.Cholakh (West Siberian Regional Sci. Res. Inst., USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.1, p.25-30 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.1, p.34-40 (1982).
Two classes of schemes for the advection equation are examined. Theoretical and experimental comparisons are made with the familiar Crank-Nicholson, Lax-Wendroff, and Gadd schemes. It is shown that the schemes proposed in this paper give smaller phase errors and reduce variance as compared with the other schemes. They may find applications in weather forecasting problems and problems in the general circulation of the atmosphere. (6 refs.)

- 64228 Interaction of clouds with the surrounding aerosol medium.** I.P.Mazin (Central Aerological Obs., USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.1, p.42-8 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.1, p.54-61 (1982).
It is shown that the interaction of clouds with the surrounding atmosphere results in a transformation of the atmosphere's aerosol characteristics. The concentration of fine aerosol particles (AP) decreases and the size and composition spectra of the AP and their vertical distribution undergo transformations. As a result, the size spectrum of the cloud particles also varies with time: the drops consolidate and their concentration decreases, with an increased probability that the cloud will turn to ice at subfreezing temperatures. The efficiencies of these processes are evaluated, and the processes studied may play an important role in the formation of clouds and precipitation. (9 refs.)

- 64229 An atmospheric vertical temperature profile measurement by detecting infrared on board.** M.Ishido (Faculty of Engng., Kobe Univ., Kobe, Japan), K.Kan, M.Toyoda. *Trans. Soc. Instrum. & Control Eng. (Japan)*, vol.19, no.1, p.48-54 (Jan. 1983). In Japanese.
Describes an attempt to obtain the vertical temperature profile of the atmosphere by measuring the vertical infrared-radiation profile of CO₂ gas on board a rocket. While the rocket was ascending and descending through the atmosphere, the vertical profile of 15 μm band infrared radiation of CO₂ gas was measured by an infrared-radiation detection instrument. Then, making an approximation that the atmosphere has a layer structure composed of 0.6 km height, and using the iterative approximation method, the vertical temperature profile was obtained from the vertical infrared-radiation profile. The results agree fairly well with those of the CIRA model (1972) although there are some discrepancies. (11 refs.)

92.60S Climatology

64230 A water vapor-energy balance model designed for sensitivity testing of climatic feedback processes. R.G.Gallimore (Dept. of Meteorology, Univ. of Wisconsin, Madison, WI, USA).

J. Atmos. Sci. (USA), vol.40, no.1, p.39-52 (Jan. 1983).

A zonal mean water vapor-energy balance (WEB) model is formulated to assess feedback interactions of the hydrologic cycle and lapse rate with the radiative fluxes, snow-dependent albedo and transport mechanisms. The WEB model is designed for comparative study and integration of many sensitivity experiments in which changes in feedback processes are introduced through variation in parameters and/or parameterizations. Specific processes in the model include 1) an explicit hydrologic cycle with the predicted atmospheric water vapor used in the determination of the solar and longwave fluxes; 2) a land albedo and surface energy budget dependency on explicit model calculations of snowfall, snow melt and snow accumulation; 3) a lapse rate dependency for the longwave emission, sensible heating and mean energy transport; and 4) separate specification for mean and eddy energy and water vapor transports. The effects of a reduced solar constant are considered. (48 refs.)

64231 The effect of tropospheric aerosols on the Earth's radiation budget: a parameterization for climate models. J.A.Coakley, Jr., R.D.Cess (Nat. Center for Atmospheric Res., Boulder, CO, USA), F.B.Yurevich. *J. Atmos. Sci. (USA)*, vol.40, no.1, p.116-38 (Jan. 1983).

Guided by the results of doubling-adding solutions to the equation of radiative transfer, the authors develop a simple technique for incorporating in climate models the effect of the background tropospheric aerosol on solar radiation. Because the atmosphere is practically nonabsorbing for much of the solar spectrum the effects of the tropospheric aerosol on the reflectivity, transmissivity and absorptivity of the atmosphere are adequately accounted for by the properties of a two-layered system with the atmosphere placed above the aerosol layer. The two-stream and delta-Eddington approximations to the radiative transfer equation then provide reasonably accurate estimates of the changes brought about by the aerosol. Furthermore, results of the doubling-adding calculations lead to a simple parameterization for the distribution of absorption by the aerosol within the atmosphere. Using these simple techniques, the authors calculate the changes caused by models for the naturally occurring tropospheric aerosol in a zonal mean energy balance climate model. The cooling influences of N₂O, methane and CO₂ pollutants are studied. (51 refs.)

64232 Some features of the day-time astroclimate on Terskol peak. V.I.Troyan.

Astrometriya & Astrofiz. (USSR), no.47, p.80-3 (1982). In Russian.

About 50% of days per year on Terskol peak are suitable for observations of the Sun. A preliminary estimation of solar seeing is made. (8 refs.)

64233 Scattering matrix of nonspherical particles. Yu.A.Aleksandrov, V.P.Tishkovets.

Astrometriya & Astrofiz. (USSR), no.48, p.37-43 (1983). In Russian.

Expressions are obtained for the light scattering matrix of the nearly spherical, homogeneous and isotropic particles of random orientation. The numerical calculations of the elements of this matrix for certain particle shapes are given. (8 refs.)

64234 On isoplanatism by the arrival angles for light rays in telescopes. I.G.Kolchinskii.

Astrometriya & Astrofiz. (USSR), no.48, p.43-52 (1983). In Russian.

The formulas of Fried (1966, 1976, 1979) and those of the author for estimating sizes of isoplanatism regions by the arrival angle for the light rays in telescopes are compared with results of measurements of correlation between the image motions of stars on small angle distances. It is concluded that the Fried formula leads to underestimation of the sizes of isoplanatism regions. Possible reasons for this fact are discussed. (21 refs.)

64235 The usefulness of a bulk refractive index for the calculation of the scattering properties of mixtures of aerosol particles at wavelength 530 nm. L.Lederer, H.Quenzel, E.Thomalla (Meteorologisches Inst., Univ. Munchen, Munchen, Germany).

Contrib. Atmos. Phys. (Germany), vol.56, no.1, p.94-107 (1983).

The optical properties of a mixture of aerosol particles are based on its size distribution and the complex refractive indices of the individual particles. This paper considers the extent to which a bulk refractive index can be used to describe the scattering properties of particle polydispersions. The bulk refractive index is calculated from the volume fractions of the components, assuming external mixture. (21 refs.)

64236 Atomic nitrogen emissions from photodissociation of N₂. C.Y.R.Wu, J.K.Chen, D.L.Judge (Dept. of Phys., Univ. of Southern California, Los Angeles, CA, USA).

J. Geophys. Res. (USA), vol.88, no.A3, p.2163-9 (1 March 1983).

Cross sections for the production of N I emissions at 1412, 1493, and 1743 Å and the undispersed fluorescence in the range 1050-1800 Å produced through photodissociative excitation of N₂ have been determined at selected intense atomic emission lines and throughout the synchrotron radiation continuum from 400 to 620 Å. The neutral excited atomic nitrogen fragments are produced through direct dissociation processes as well as predissociation from the well-known two-electron excited Rydberg states. The yield for photodissociative excitation processes is found to have the same magnitude as that for photodissociative ionization processes reported by other investigators. The Doppler shifts of the excited atomic fragments have been calculated, and the relevance to atmospheric observations is discussed. (32 refs.)

64237 Photoelectric observations of shadow bands during 16 February 1980 total solar eclipse from Japal-Rangapur observatory. A.Bhatnagar, D.B.Jadhav, R.M.Jain, R.N.Shelke, S.P.Purohit (Vedhsala Udaipur Solar Obs., Udaipur, India), R.V.Bhonsle, R.Pratap.

Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.260-2 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

Intensity fluctuations of shadow bands observed photoelectrically during total solar eclipse of 16 February 1980 are reported. Power spectrum analysis indicates that significant power appears at frequencies 0.32 and 0.58 Hz, thus corresponds to periods of 3 and 1.7 seconds. (no refs.)

92.90 OTHER TOPICS IN HYDROSPHERIC AND ATMOSPHERIC GEOPHYSICS

64238 Possible limits on the composition of the Archaean ocean. J.C.G.Walker (Dept. of Atmospheric & Oceanic Sci., Univ. of Michigan, Ann Arbor, MI, USA).

Nature (GB), vol.302, no.5908, p.518-20 (7 April 1983).

It has been suggested that the partial pressure of carbon dioxide in the terrestrial atmosphere was larger in the past than it is at present. It is worth considering whether the geological record is in any way inconsistent with the proposed high partial pressures of carbon dioxide. The author examines the potential impact of high carbon dioxide partial pressure on ocean chemistry and ask what constraints are imposed by the known record of chemical sedimentation through time. The evidence consists of the persistence throughout almost the entire sedimentary rock record of calcium carbonate and sulphate precipitation. The methods of Holland (1976) are used to set limits on the composition of the water from which precipitation occurred. (31 refs.)

64239 The global temperature trend in the Cenozoic. I.I.Borzenkova (State Hydrological Inst., USSR).

Sov. Meteorol. & Hydrol. (USA), no.12, p.17-25 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.12, p.25-35 (1981).

The results of paleotemperature determinations made by oxygen-isotope analysis of the remains of marine planktonic and benthic microfauna are generalized, along with results of paleobotanic analyses of fossil flora from the Cenozoic (the last 60-65 million years). Analysis of these materials indicates a progressive lowering of temperature over the entire period at all latitudes in both hemispheres. Against the background of the general cooling trend, there have been two warming periods (the Eocene and Early Miocene maxima) that are observed at all latitudes. The Southern Hemisphere glacial cover formed about 15-11 million years ago, while the Northern Hemisphere remained ice-free until the middle of the Pliocene (3-3.5 million years ago). Seasonal Arctic Basin ices may have existed throughout the entire Pliocene (4.5-5.0 million years ago), while the permanent ice cover formed no earlier than 0.8-0.9 million years ago. (30 refs.)

93.55 INTERNATIONAL ORGANIZATIONS, NATIONAL AND INTERNATIONAL PROGRAMS

- 64240 Earthquake prediction program in Japan. K.Mogi (Earthquake Res. Inst., Tokyo Univ., Tokyo, Japan).
- Earthquake Prediction. An International Review. Symposium on Earthquake Prediction, Mohonk, NY, USA, 12-16 May 1980 (Washington, DC, USA: American Geophys. Union 1981), p.635-66
- The first 5-year earthquake prediction project was started in 1965, just after the Niigata earthquake of 1964, and the project has been growing at a steady rate (Kanamori, 1970; Ha-iiwara, 1975; Rikitake, 1976). The project consists of three categories. The first is various observations for long-term prediction, such as geodetic surveys and seismic observations. The second is various observations for short-term prediction, such as continuous observations of crustal deformation. The third is various fundamental studies, such as rock fracture experiments. Major topics of earthquake prediction are in the past 10 years in Japan are discussed in some detail. (84 refs.)

93.85 INSTRUMENTATION AND TECHNIQUES FOR GEOPHYSICAL RESEARCH

- 64241 Probe experiment for measurement of plasma parameters and ion drift velocities in the ionospheric plasma onboard the Intercosmos-Bulgaria 1300 satellite. K.Serafimov, L.Bankov, M.Gusheva, T.Ivanova, V.Markov, S.Chapkunov, I.Kutiev, V.Genov (Central Lab. for Space Res., Sofia, Bulgaria).
- Acta Astronaut. (GB)*, vol.9, no.10, p.637-40 (Oct. 1982). [received: March 1983]
- Describes a complex of probe instruments designed for the equipment: ID-1, P-6, P-7 and DIET-2 to define the local plasma parameters. The instruments measure: electron temperature, electron density, ion temperature, ion density, ion energy distribution, mass ion composition, complete ion drift vector 0.1 to 5 km/s and ion density variations within the range 0.50-100%. (2 refs.)
- 64242 Interpretation of SIR-A Seasat and Landsat coregistered data over Algerian playas. P.Rebillard (Jet Propulsion Lab., Pasadena, CA, USA), J.-L.Bailais.
- C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.1, p.103-6 (10 Jan. 1983). In French.
- Comparison of coregistered SIR-A, Seasat and Landsat data over playas located in Algeria shows that the radar backscatter is highly sensitive to the roughness and moisture of the chotts. Linear objects perpendicular to the radar illumination direction are easier to detect than the ones parallel to it. A sand cover detected on the Landsat scene but not seen on the radar images may have been penetrated by microwaves. (4 refs.)

- 64243 Laser measurements of the stratospheric ozone layer. J.Werner, K.W.Rothe, H.Walther (Sektion Phys., Univ. Muenchen, Garching, Germany). *Laser & Optoelektron. (Germany)*, vol.15, no.1, p.17-21 (March 1983). In German.

An excimer laser is used to investigate the stratospheric ozone layer from the summit of the Zugspitze in the Alp Mountains. The radiation of the XeCl laser itself is strongly absorbed by ozone; the non-absorbed reference line—necessary for the differential absorption method—is generated by stimulated Raman scattering. After a short summary of the method, the lidar system is described and some preliminary results are presented. The feasibility of using the system for monitoring stratospheric aerosol layers from volcanic eruptions is demonstrated. (15 refs.)

- 64244 Laboratory evaluation of an airborne ozone instrument that compensates for altitude/sensitivity effects. G.L.Gregory, C.H.Hudgins, R.A.Edahl,Jr. (Langley Res. Center, NASA Hampton, VA, USA).
- Environ. Sci. & Technol. (USA)*, vol.17, no.2, p.100-3 (Feb. 1983).
- One problem encountered in the use of air-quality instrumentation on aircraft is the variation of instrument sensitivity with pressure as the result of altitude changes of the aircraft. Many instruments experience sensitivity changes as much as a factor of 2 at altitudes of 6 km. Discussed are recent modifications to a chemiluminescent (ethylene) ozone detector that allow the instrument to automatically compensate for pressure/sensitivity effects. The modification provides automated mass flow rate control for both the sample and ethylene gas flows. During simulated altitude changes (300 m/min from mean sea level to 3-km altitude), flow rates were controlled to within 3% of the set point. Laboratory data are summarized. (3 refs.)

- 64245 A simple and inexpensive method for measuring integrated light energy. T.J.Sullivan, M.C.Mix (Dept. of General Sci., Oregon State Univ., Corvallis, OR, USA).
- Environ. Sci. & Technol. (USA)*, vol.17, no.2, p.127-8 (Feb. 1983).
- The ozalid technique is a simple and inexpensive method for measuring integrated sunlight energy in the field for periods up to a maximum of 1 day. The authors describe a modification of the ozalid technique that makes it suitable for long-term light measurements. Data from the modified ozalid meter were calibrated against an Eppley Precision Spectro Pyranometer. (1 ref.)

- 64246 Coal analysis by nuclear methods. C.G.Clayton, M.R.Wormald (Appl. Nuclear Geophys. Group, AERE, Harwell, England).
- Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.3-22 (Jan. 1983).
- Reviews the use of low-energy X-rays, γ -rays and neutron interaction techniques for coal analysis in applications which range from borehole logging to on-line analysis in coal preparation plants and in coal-burning power stations. Neutron-induced prompt γ -ray analysis provides an exciting prospect for the future as it allows direct on-line measurement of the concentrations of all the major elements in coal coupled with the indirect determination of ash content and calorific value. (19 refs.)

- 64247 In-situ analysis of coal by measurement of neutron-induced prompt γ -rays. M.R.Wormald, C.G.Clayton (Appl. Nuclear Geophys. Group, AERE, Harwell, England).
- Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.71-82 (Jan. 1983).
- In general, neutron-induced prompt γ -ray techniques provide the possibility of a total elemental analysis of the major elements in a material provided that γ -ray production cross-sections are adequate and account can be taken of perturbations in neutron flux arising, for example, from variations in density, moisture content and in the concentrations of elements which can be regarded as neutron poisons. A method is described which allows a total elemental analysis of coal by measurement of γ -ray spectra from fast and thermal neutron interactions and which are independent of variations in neutron flux in the material. (11 refs.)

- 64248 Multi-element analysis of coal during borehole logging by measurement of prompt γ -rays from thermal neutron capture. C.G.Clayton, A.M.Hassan, M.R.Wormald (Appl. Nuclear Geophys. Group, AERE, Harwell, England).
- Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.83-93 (Jan. 1983).
- The performance of borehole logging equipment is described which is based on a ^{252}Cf neutron source and measurement of the spectra of thermal neutron capture γ -rays from most of the important elements in coal. It is shown that although a high statistical counting accuracy can be obtained for several elements in a measuring period of about 5 min, the derived concentrations are limited by the low capture cross-section of carbon. It is concluded that it is strongly preferable to employ a high energy neutron source, such as $^{241}\text{Am-Be}$, so as to include oxygen in the analysis and to obtain a higher precision of measurement for all the other elements. (11 refs.)

- 64249 Nuclear geophysics in prospecting, exploration and development of oil and gas fields. E.V.Karus, Yu.S.Shimelevich (All-Union Res. Inst. of Geophys., Moscow, USSR).
- Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.95-117 (Jan. 1983).
- Nuclear-geophysics investigations are widely and successfully used in prospecting, exploration and development of oil and gas fields. These methods are most efficient in the further exploration of producing oil fields, the control of oil-and-gas field development and in the calculation of reserves of large oil and gas fields. Specific nuclear-geophysical methods (conventional and spectrometric γ -logging, γ - γ logging, neutron logging, pulsed neutron logging and its modifications, nuclear magnetic resonance logging), techniques of application, examples of resolved problems and the specification of down-hole equipment are discussed in this review. (34 refs.)

- 64250 Stochastic approach to the pulsed neutron logging methods. J.A.Czubek (Inst. of Nuclear Phys., Krakow, Poland).
- Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.119-28 (Jan. 1983).
- Neutron emissions from a steady state neutron source (of the α -Be or ^{252}Cf types) can be treated as a white noise stochastic process. In the rock space, according to different neutron well-logging methods, different types of radiation resulting from nuclear reactions between the source neutrons and the nuclei of the rock elements appear. The resulting radiation is in this case the shot noise process. By doing the time cross correlation between the input (white noise) and the output (shot noise) processes, or the auto-correlation of the output process alone, the transmission function of the system is obtained. Here the transmission function is just the die-away curve observed in all kinds of pulsed neutron logs. Experimental principles and the conditions of the correlation measurements are discussed. Nuclear reactions together with the space and time distribution of different types of radiation observed in the neutron well-logging methods are presented with a view to getting the rock nuclear parameters from the correlation methods. (12 refs.)

- 64251 Measurement of the thermal neutron absorption cross section of rock samples.** J.A.Czubek, K.Drozdzowicz, E.Krynica-Drozdzowicz, A.Igiel-ski, U.Woznicka (Inst. of Nuclear Phys., Krakow, Poland). *Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.143-51 (Jan. 1983). A knowledge of the absorption cross section of thermal neutrons for rock materials and brines is an important factor in the quantitative interpretation of the neutron lifetime logs. A new method of measurement of that parameter is presented; it is independent of the transport cross section of the sample. The method has been checked on artificial materials and on natural brine and dolomite. The volume of the sample needed is of the order 500 cm³. (12 refs.)
- 64252 Advances in gamma-gamma logging.** J.A.Czubek (Inst. of Nuclear Phys., Krakow, Poland). *Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.153-72 (Jan. 1983). The development of γ - γ logging methods for measuring rock density and elemental composition are presented along with the physical background of the methods and experimental results from a number of research laboratories. Some methods of tool calibration based on a semi-theoretical approach are discussed. The basic physical features of some industrial applications are given as well as some remarks about future development. (60 refs.)
- 64253 The application of Monte Carlo computations to formation analysis by neutron interactions.** L.G.Sanders (Appl. Nuclear Geophys. Group, AERE, Harwell, England). *Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.173-98 (Jan. 1983). Monte Carlo neutron and γ -ray tracking techniques can make a major contribution to the study and development of methods for the analysis of formations by neutron interactions. Problems which arise in neutron interaction analysis and the role of Monte Carlo tracking programs are discussed. Examples are presented of some Monte Carlo studies on analysis by γ -rays from neutron interactions and on oil-well log interpretation. (6 refs.)
- 64254 Airborne γ -ray spectrometry in uranium exploration. Principles and current practice.** Q.Bristow (Geological Survey of Canada, Ottawa, Canada). *Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.199-229 (Jan. 1983). Experiments have shown that the radioelement content of bedrock is generally reflected by that of overlying till and that areas showing broad regional enrichment of radioelement concentrations are favourable for uranium exploration. Airborne γ -ray spectrometry with equipment having typical sodium iodide detector volumes of 50 L is used to record the natural radiation intensity due to potassium, uranium and thorium by flying grids at ground clearances of about 120 m. γ -ray spectra are recorded continuously in flight with navigational data all of which is processed off-line to produce maps of radioelement distribution with concentration contours. (57 refs.)
- 64255 Borehole logging for uranium by measurement of natural γ -radiation.** P.G.Killeen (Geological Survey of Canada, Ottawa, Canada). *Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.231-60 (Jan. 1983). Calibration facilities with model holes have been established in several countries to support quantitative borehole measurements. New high density detector materials have been evaluated and have shown to yield considerable improvements for operation in the restricted environment of the borehole. γ -ray spectral logging has become available partially as a result of spin-off from parallel developments in surface and airborne γ -ray spectrometric survey equipment. The use of the high resolution solid state detector has proceeded through a series of developments to its present availability as a commercial borehole logging service in spite of the inherent detector cooling problems. Digital measurements are replacing the earlier analog measurements, and minicomputer or microprocessor-based logging systems have enabled new data processing techniques such as inverse filtering to be implemented in real time at the site of the borehole. (125 refs.)
- 64256 Uranium logging with prompt fission neutrons.** D.R.Humphreys, R.W.Barnard, H.M.Bivens, D.H.Jensen, W.A.Stephenson, J.H.Weinlein (Sandia Nat. Labs., Albuquerque, NM, USA). *Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.261-8 (Jan. 1983). Describes a uranium logging probe which can assay U₃O₈ concentrations as slow as 100 ppm at 0.5 m/min. The probe sends 100 pulses per second of 14 MeV neutrons (2×10^6 neutrons/pulse) into the formation surrounding a borehole, and detects prompt epithermal neutrons returning from fissioning ²³⁵U. Various models of the probe have logged hundreds of boreholes in the western United States since 1976. The neutron generator is now commercially available and the probe design is available to the public. (9 refs.)
- 64257 The operation and life of the Zetatron neutron tube in a borehole logging application.** L.A.Shope, R.S.Berg, M.L.O'Neal, B.E.Barnaby (Sandia Nat. Labs., Albuquerque, NM, USA). *Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.269-72 (Jan. 1983). The physical assembly and electrical characteristics of a Zetatron neutron tube are described. This tube is small (38 mm diameter by 126 mm), sealed-off, pulsed deuterium-tritium accelerator. Peak output rates up to 8×10^{11} neutron/s (6×10^6 neutrons/pulse) are typical. Mean time to failure in a borehole logging application was 152 h for the bare tube and 91 h for the tube-transformer assembly. Shelf life appears to be at least 2 yr. (12 refs.)
- 64258 Determination of the concentration of uranium in soil and stream sediment samples using a high resolution energy-dispersive X-ray fluorescence analyser.** T.W.Packer (Appl. Nuclear Geophys. Group, AERE, Harwell, England). *Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.273-81 (Jan. 1983). An energy-dispersive X-ray fluorescence analyser is described, based on a high resolution Si(Li) semiconductor detector, which is suitable for directly determining the concentration of uranium in stream sediment and soil samples. The equipment can be used in a field or base laboratory or it can be mounted in a vehicle and operated from a portable petrol generator. Matrix absorption effects, which prevail due mainly to variations in the concentration of iron and calcium in the samples, are corrected for by simultaneously measuring the intensity of Compton scattered X-rays. Rapid analysis, 130-200 s measurement time, and low limits of detection 11 ppm (95% confidence level), are consistent with the requirements of geochemical prospecting. (2 refs.)
- 64259 Uranium isotopic disequilibrium in ground water as an indicator of anomalies.** J.K.Osmond, J.B.Cowart (Geology Dept., Florida State Univ., Tallahassee, FL, USA), M.Ivanovich. *Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.283-308 (Jan. 1983). Because of the unique elemental and isotopic properties of uranium, ground water surveys are a most appropriate approach to prospecting for surficial and secondary uranium deposits. Uranium ($4+$) is generally immobile, but in oxidising and carbonate bearing waters U($6+$) is mobile and conservative. Uranium-234 is the radiogenic daughter of ²³⁸U. The intervening α -decay event causes recoil displacements and radioactive disequilibrium between the two isotopes in open systems such as surficial aquifers. Extreme variations in dissolved uranium composition of ground waters combined with significant

variations in the ratio ²⁴U/²³⁸U are indicative of the proximity and stage of evolution of secondary deposits. (59 refs.)

- 64260 A universal gamma-gamma method for simultaneous determination of rock and ore properties.** J.Charcucinski (Inst. of Phys. & Nuclear Tech., Univ. of Mining & Metall., Krakow, Poland). *Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.353-61 (Jan. 1983). A method for the simultaneous determination of heavy element content, density, borehole diameter and grain size is described, which is based on investigation of the changes in spectrum shape. By analysing these changes in a quantitative manner, information regarding the physical parameters of the medium can be obtained. The results of laboratory tests of the method are presented. (16 refs.)
- 64261 The combination of multi-element neutron activation analysis and multivariate statistics for characterisation in geochemistry.** J.I.W.Watterson, J.P.F.Sellschop, C.S.Erasmus, R.J.Hart (NIM-Wits Activation Res. Group, Univ. of the Witwatersrand, Johannesburg, S Africa). *Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.407-16 (Jan. 1983). Instrumental neutron activation analysis provides an accurate method for the determination of some 20 to 40 elements in geological samples. This method has been combined with pattern recognition techniques to provide a powerful method for the study of geochemical differences and for the classification of unknown samples. Discriminant analysis, a statistical method of pattern recognition, was applied to the study of mineralisation in granites, to the classification of diamonds, to the identification of sedimentary units from the Witwatersrand and to the classification of coals from the Witbank Coalfield in South Africa. The results show that the methods can be used to identify and map the mineralised phase of the granite. In the case of the diamonds trace element signatures were found which were characteristic of the sources and these were used to classify very pure unknown samples with a high rate of success. (22 refs.)
- 64262 Mineral exploration of the sea bed by towed sea bed spectrometers.** B.W.Thomas, C.G.Clayton, V.V.C.Ranasinghe, I.M.Blair (Appl. Nuclear Geophys. Group, AERE, Harwell, England). *Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.437-49 (Jan. 1983). Marine mineral deposits and the subsequent need for in-situ analytical methods of exploration are considered. Nuclear techniques based on γ -ray spectrometry offer potential for continuous surveying. In the present paper various aspects of the design and performance of both natural and neutron-induced towed γ -ray spectrometers are discussed in detail. The interpretation of elemental abundances from the measured data is of particular importance and has been investigated using laboratory experimental and computer techniques. (7 refs.)
- 64263 Tracer techniques in hydrology.** G.V.Evans (Geophys. Tracers Group, AERE, Harwell, England). *Int. J. Appl. Radiat. & Isot. (GB)*, vol.34, no.1, p.451-75 (Jan. 1983). Presents a review of the use of environmental and artificial tracers in studies of surface waters, ground waters and sediments. Both stable and radioactive substances are considered. The environmental tracers include those whose natural abundance variations allow interference of the origins, movement or depositional history of water or sediments and those whose presence in the environment is due to man's past activities. Examples of the former type are the stable isotopes of hydrogen, oxygen and sulphur, noble gases and the radioactive isotopes carbon-14 and uranium series. The latter type of environmental tracers include radioactive elements from nuclear bomb testing and fluorocarbon compounds. Artificial tracers, categorized into radioactive, acti-vable, chemical and particulate tracers are described together with their applications in flow measurement, run-off transit-time measurement, lake dynamics and ground water movement studies. Sediment movement studies are briefly described. (86 refs.)
- 64264 Laser-acoustic measurements for remotely determining bathymetry in shallow turbid waters.** G.D.Hickman, J.A.Edmonds (Appl. Sci. Technol. Inc., Arlington, VA, USA). *J. Acoust. Soc. Am. (USA)*, vol.73, no.3, p.840-3 (March 1983). A laser technique is described that has the potential for being developed into an airborne remote sensing system for bathymetric mapping of shallow-turbid waters. This hybrid system consists of an infrared CO₂ laser transmitter and a highly sensitive microphone receiver located in the air. The interaction of the laser beam with water generates acoustic signals in water having pulse widths of 20-30 μ s and a frequency spectrum peaking between 15-25 kHz. Measurements have been made from both a floating laboratory and an operating ship. These measurements were made using a 5 to 15-J CO₂ laser to generate a sound pressure level (SPL) of 185-195 dB re: 1 μ Pa in water at a depth of 1 m. Measurements made in quiescent waters recorded water depths of 20 ± 0.1 m, while the maximum water depth obtained aboard ship was 13 ± 1 m. The two major problem areas encountered were environmental noise and the angular dependence of the bottom sediment echoes as they penetrated a 'wavy' water surface. (10 refs.)
- 64265 Comparison of Earth rotation as inferred from radio interferometric, laser ranging and astrometric observations.** D.S.Robertson, W.E.Carter (Nat. Ocean Service, NOAA, Rockville, MD, USA), R.J.Eanes, B.E.Schutz, B.D.Tapley, R.W.King, R.B.Langley, P.J.Morgan, I.I.Shapiro. *Nature (GB)*, vol.302, no.5908, p.509-11 (7 April 1983). New techniques are being developed to improve the spatial and temporal resolutions achievable in measurements of the rotation vector of the Earth. Such improvements are expected to expose fine details of this rotation and to aid in understanding their physical causes. Although not yet fully developed, two of these techniques are now in routine use: radio interferometry, and laser ranging to the Moon and to artificial satellites. To assess the accuracy being achieved in the measurement of Earth rotation it is useful to compare results obtained with these different techniques (including astrometry). The authors compare results for a 400-day period from late September 1980 to December 1981, for which data from all three types of measurements are available. The authors also compare corresponding results from classical astrometric observations which demonstrate the degree of improvement in accuracy afforded by the new techniques. (9 refs.)
- 64266 Determination of the coherent and incoherent signal components of stochastic receiving signals from experimental data [soil structure].** E.Muller (Wilhelm-Pieck-Univ. Rostock, Rostock, Germany). *Nachrichtentechn. Elektron. (Germany)*, vol.33, no.3, p.118-21 (1983). In German. An estimation method for the determination of the parameters of the Rice probability density distribution function of characteristic values determined by computation from experimental data is represented and examined by means of hydroacoustic results of measurement about the soil structure. The information about coherent and incoherent signal components or the signal-to-noise ratio gained from the estimated parameters can be used as basis for an object identification or for the disturbance variable reduction. (4 refs.)

- 64267 Atmospheric laser spectrometer with an external cavity mirror.** A.P.Godlevskii, A.K.Ivanov, Yu.D.Kopytin. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.87-9 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.150-4 (July 1982). [received: April 1983]
Experimental data are given on an intracavity ruby laser spectrometer with the cavity in the actual atmosphere in a length of up to 160 m. The laser kinetics are studied under actual weather conditions in the cavity. Sensitivity and error of humidity measurement at low negative temperatures in the atmosphere are determined. (11 refs.)
- 64268 Investigating mirages with an astronomical telescope.** C.Floor (Royal Netherlands Meteorological Inst., De Bilt, Netherlands). *Phys. Educ. (GB)*, vol.18, no.2, p.80-2 (March 1983).
Some schools or colleges where astronomy is part of the science curriculum are fortunate enough to have an astronomical telescope for observing the sky at night. The instrument can, however, also be used in the day-time for the investigation of road mirages and other mirages over warm land or water. If the telescope is fitted with an adaptor to which a camera can be attached students should be able to take photographs. The author first summarises some basic principles of mirages and their formation, and then goes on to describe the photographic techniques that can be used. (4 refs.)
- 64269 Monte Carlo simulation of small air-mass showers.** H.C.Vaughan (Astronomy Dept., Iowa State Univ., Iowa State Univ., Ames, IA, USA), G.R.White, P.A.Carr. *Pure & Appl. Geophys. (Switzerland)*, vol.120, no.2, p.261-72 (1982).
The present model permits simulation of any geographic region and the symmetrical or random positioning of any number of rain gauges. The operator has the option of entering precipitation parameters: rain cell diameter, duration, rain swath length, vector angle, and precipitation amount of any number of discrete showers. In a series of computations the model generates (1) a random 'first echo' location and resulting rain swath, which is superimposed on a specific grid of rain gauges; (2) the number of rain gauges receiving a hit; and (3) the number of undetected rain events within an area. By use of a portion of the Iowa climatological rain gauge network and parameters derived from radar and rain gauge observations the model shows that only 7% of single cell showers are determined by the existing sampling grid. (8 refs.)
- 64270 Expendable bubble tiltmeter for geophysical monitoring.** J.A.Westphal, M.A.Carr, W.F.Miller (Div. of Geological & Planetary Sci., California Inst. of Technol., Pasadena, CA, USA), D.Dzurisin. *Rev. Sci. Instrum. (USA)*, vol.54, no.4, p.415-18 (April 1983).
An unusually rugged highly sensitive and inexpensive bubble tiltmeter has been designed, tested, and built in quantity. These tiltmeters are presently used on two volcanoes and an Alaskan glacier, where they continuously monitor surface tilts of geological interest. This paper discusses the mechanical, thermal, and electric details of the meter, and illustrates its performance characteristics in both large ($>10^{-4}$ radian) and small ($<10^{-6}$ radian) tilt environments. The meter's ultimate sensitivity is better than 2×10^{-8} radians rms for short periods (hours), and its useful dynamic range is greater than 10^4 . Included is a short description of field use of the instrument for volcano monitoring. (13 refs.)
- 64271 Measurement of flow velocities in the ocean with a laser Doppler hydrometer.** N.K.Shelkovnikov, V.V.Rozanov, A.S.Chirkin (M.V. Lomonosov State Univ., Moscow, USSR). *Sov. Tech. Phys. Lett. (USA)*, vol.8, no.8, p.406-8 (Aug. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.15-16, p.937-40 (Aug. 1982). [received: April 1983]
Reports the first measurements of flow velocities in the ocean by the method of laser Doppler hydrometry. The measurements were taken on the eleventh voyage of the research vessels Akademik Petrovskii (January-March 1981) with the KIT-2 system, a newly developed laser Doppler system. The results show that it is possible to measure flow velocities under natural conditions in arrangements with forward scattering and backscattering of the laser beam. (4 refs.)
- 64272 A remote recording unit for floated automatic water level recording systems.** I.M.Shenderovich, L.S.Kleban (Sci. Res. Inst. of Instrumentation, USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.12, p.94-6 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.12, p.113-15 (1981).
The design and basic technical specifications of a remote system for observing water levels in rivers, lakes, reservoirs, and inshore regions of seas and oceans are described. This system, which was developed by the Scientific-Research Institute (NII) of Instrumentation, has successfully passed state acceptance tests and has been included in the USSR State Register of Measurement Systems. (4 refs.)
- 64273 Mapping fields of the meteorological elements given at the nodes of a latitude-longitude grid.** G.S.Rivin, A.I.Kulikov (West Siberian Regional Sci. Res. Inst., USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.1, p.31-7 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.1, p.41-8 (1982).
Algorithms are formulated and proposed for solution of four problems that arise in drawing isolines of meteorological elements specified at the nodes of a world-wide latitude-longitude grid: 1) selection of various cartographic projections; 2) plotting the isolines; 3) finding and mapping local extremes; 4) representing the contours of continents in the required projection. Computerization of the procedure for the BESM-6 and EC-1052 computers is described. Fields drawn from FGGE data are presented. (12 refs.)
- 64274 The MMR-06-M meteorological rocket and its instrument package for measurement of density, temperature, wind, and electron concentration.** D.Gaitandzhiev, H.Gernandt, A.N.Mel'nikov, I.O.Neelov, S.V.Pakhonov (Inst. of Hydrology & Meteorology of Meteorological Service of NRB, USSR). *Sov. Meteorol. & Hydrol. (USA)*, no.1, p.86-8 (1982). Translation of: *Meteorol. & Gidrol. (USSR)*, no.1, p.103-5 (1982).
Two versions of the nose cone for the small MMR-06-M meteorological rocket are reported: one is for measurement of density, temperature, and wind by the falling-sphere method, and the other for wind measurements with the aid of dipole radar reflectors and electron concentration measurements by the electrostatic-probe method. The work as performed for the 'Interkosmos' program. Design features of the instruments used are described, and nose-cone layout schemes are presented. (8 refs.)
- 64275 Microwave systems for satellite remote sensing.** W.Keydel (Inst. für Hochfrequenztech., DFLVR, Oberpfaffenhofen, Germany). *Z. Flugwiss. & Weltraumforsch. (Germany)*, vol.7, no.1, p.21-8 (Jan.-Feb. 1983). In English.
Microwaves have application to satellite remote sensing principally in active systems synonymous with radar and in passive systems synonymous with microwave radiometer. The present state of the art of such microwave systems is shown with respect to possible applications and the most important realized or planned systems are presented concerning the respective technical

data. Typical microwave results obtainable with radar or microwave radiometers respectively are presented. The advantages and disadvantages of active and passive microwave systems in comparison to each other and to optical systems briefly discussed. (4 refs.)

- 64276 Application of excimer lasers for remote sensing.** J.B.Laudenslager (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA). Topical Meeting on Excimer Lasers, Incline Village, NV, USA, 10-12 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.WB1/1-4.
Discusses the applications of excimer lasers for use in laser-induced fluorescence (LIF) measurements of atmospheric gases, biologic organisms, and minerals as well as the sensing technique requirements for DIAL measurements of gases and in situ ionization of atmospheric molecules. The design requirements of the laser and detection system are also discussed. (6 refs.)
- 64277 Practical interpolation of 2-D surfaces using the Gerchberg algorithm.** M.J.Carlotto, V.T.Tom (Analytic Sci. Corp., Reading, MA, USA). Topical Meeting on Signal Recovery and Synthesis with Incomplete Information and Partial Constraints, Incline Village, NV, USA, 12-14 Jan. 1983 (Washington, DC, USA: Opt. Soc. America 1983), p.WA3/1-4.
The interpolation of 2-D wind and hydrographic surfaces is accomplished using the Gerchberg algorithm. Special emphasis is given to algorithm implementation on an array processor. Specific applications presented are: the generation of hydrographic surfaces from bathymetry data obtained from the hydrographic airborne laser sounder and the generalization of wind-flows from cloud imaging obtained from the Geostationary Operational Satellite. Experimental results obtained using a VAX 11/780 and FPS 120 array processor system are presented. (6 refs.)

94.00 AERONOMY AND SPACE PHYSICS

94.10 PHYSICS OF THE NEUTRAL ATMOSPHERE

(for planets, see 96.30)

64278 Initial tests of an index based on AL values for modeling magnetic storm related perturbations of the thermosphere. J.S.Nisbet, C.Stehle, E.Bleuler (Dept. of Electrical Engng., Pennsylvania State Univ., University Park, PA, USA).

J. Geophys. Res. (USA), vol.88, no.A3, p.2175-80 (1 March 1983).

Very large perturbations in the thermosphere and ionosphere are induced by motions driven by heating and by electric fields in the auroral electrojet regions. Winds carry these effects to all latitudes. Because of this, thermospheric models have terms associated with magnetic activity. The Kp and Ap indices have usually been employed; however, these are poorly correlated with the temporal variations. Initial experiments are described with new indices based on the auroral electrojet indices of magnetic activity that are more directly related to the energy driving functions. The new indices are based on the time-weighted average of the auroral electrojet indices over a period rather than on instantaneous values. Comparisons are made with the 3-hour Ap index for high-latitude atomic oxygen densities under disturbed conditions. (17 refs.)

64279 On the extraction of atmospheric turbulence parameters from radar backscatter Doppler spectra. I. Theory. W.K.Hocking (Max-Planck-Inst. fur Aeronomie, Katlenburg-Lindau, Germany).

J. Atmos. & Terr. Phys. (GB), vol.45, no.2-3, p.89-102 (Feb.-March 1983).

A theory is developed for the extraction of RMS velocities of scatterer motions from spectra measured with a Doppler backscatter radar. The effects of finite beam-widths, finite pulse lengths, beam broadening, shear broadening, and other such spectral 'contaminants' are considered. It is shown that these 'contaminants' can play a major role in determining the measured spectral widths (and, equivalently, the signal fading time), and so must be properly considered if the spectral widths are to be used to extract the RMS motions of the scatterers. It is also shown that these RMS motions can be used to estimate turbulence intensities in those cases where turbulence is the dominant cause of the scatterer motions. (24 refs.)

64280 Mesospheric turbulence intensities measured with a HF radar at 35°S. II. W.K.Hocking (Max-Planck-Inst. fur Aeronomie, Katlenburg-Lindau, Germany).

J. Atmos. & Terr. Phys. (GB), vol.45, no.2-3, p.103-14 (Feb.-March 1983).

For pt.I see ibid., vol.45, no.2/3, p.89-102 (1983). In part I a theory has been developed for extraction of turbulence energy dissipation rates from spectra measured with a radar. It was shown that factors apart from turbulence contribute to the observed spectral widths, and that these factors must be considered if accurate estimates of energy dissipation rates are to be obtained. In particular, beam-width broadening and shear broadening were important. In this paper the first results obtained with this theory are presented. The results were obtained using the large HF array at Adelaide, Australia, primarily during the southern hemisphere winter of 1981. Results are consistent with rocket measurements of turbulence, with typical values varying between 0.01 and 0.2 W kg⁻¹ at 80-90 km altitude. (33 refs.)

64281 Atmospheric scattering effects on ground-based measurements of thermospheric winds. V.J.Abreu, G.A.Schmitt, P.B.Hays, J.W.Meriwether, Jr., Ca.A.Tepley (Space Phys. Res. Lab., Univ. of Michigan, Ann Arbor, MI, USA), L.L.Cogger.

Planet. & Space Sci. (GB), vol.31, no.3, p.303-10 (March 1983).

Inherent in observations of thermospheric winds from the ground with the Fabry-Perot interferometer is the assumption that the measured Doppler shift is a property of the source medium viewed by the instrumental line of sight. However, ground based airglow observations in regions of weak airglow emission near large intensity gradients may be contaminated by scattered light. Light from areas where the emission is strong can be scattered by the lower atmosphere into the field of view of the observations. Thermospheric winds deduced from the observed Doppler shifts will then show apparent convergence or divergence with respect to the site of observation. (17 refs.)

64282 Prevailing wind at heights of 80-100 km at various longitudes during the winter and spring periods of 1976-1977. N.A.Makarov (Inst. of Experimental Meteorology, USSR).

Sov. Meteorol. & Hydrol. (USA), no.12, p.30-3 (1981). Translation of: *Meteorol. & Gidrol. (USSR)*, no.12, p.41-5 (1981).

The results of synchronous meteor-radar measurements of prevailing-wind velocities made at Khabarovsk and Obninsk in 1976-1977 are reported. The data indicate similarity of the seasonal wind cycle at altitudes of 80-100 km over the Far Eastern and European regions. In addition to the seasonal trend, the prevailing-wind velocities are subject to variations with periods of 5-30 days, which correlate weakly in the data from the two stations. The lower-thermosphere wind field is observed to react sharply to winter stratospheric warming. The spring transformation at Khabarovsk was distinguished by a sharper reversal of the zonal flow and by weakening of the easterlies in April. (9 refs.)

94.10Q Airglow and nightglow

64283 Tropical nightglow observations and predictions from ionospheric models. J.Christophe, G.Thuillier (Service d'Aeronomie, CNRS, Verrieres-le-Buisson, France), M.Fehrenback, Y.Sahai, G.Weill.

J. Atmos. & Terr. Phys. (GB), vol.45, no.2-3, p.137-48 (Feb.-March 1983).

To study the tropical nightglow emissions in the vicinity of the Brazilian magnetic anomaly, two balloons were flown in February 1973 and 1977 carrying photometers. The behavior in the tropical nightglow of the 630 and 557.7 nm lines is described and compared with predictions based on recent ionospheric models. Possible effects of the magnetic activity on the F₂-layer in the tropics are suggested which are not accounted for by the ionospheric models. (40 refs.)

64284 Visible continuum emission and gravity waves. A.Molina (Dept. de Fisica Fundamental, Univ. de Granada, Granada, Spain).

Planet. & Space Sci. (GB), vol.31, no.3, p.331-7 (March 1983).

Observed oscillations in the visible continuum emission (5000 Å) are studied considering the usual visible emission mechanism, NO+O (both two-body and three-body paths). Characteristic parameters of internal gravity waves are obtained using Hines' linear theory. Values of the kinetic energy density ϵ , and temperature variations $\Delta\theta$, due to gravity waves are calculated. The results ($\epsilon \sim 10^6$ cm² s⁻², $\Delta\theta \approx 4$ -9K) are in agreement with those obtained by means of different techniques reported in the literature. A similar analysis of the simultaneous green-line emission data is made and a comparison is drawn between the results obtained for both emissions. An expression relating relative brightness of continuum emission and relative perturbations of atmospheric density is proposed. (41 refs.)

64285 Equatorial depletions in the 630.0 nm airglow at Vanimo. E.H.Carman (Ionospheric Prediction Service, Australian Dept. of Sci. & Technol., Vanimo, Papua New Guinea).

Planet. & Space Sci. (GB), vol.31, no.3, p.355-62 (March 1983).

Using ground based airglow photometry, depletions in the 630.0 nm airglow were observed at Vanimo near the southern limb of the intertropical airglow arc. The results were compared with the more common properties of equatorial plasma bubbles such as depletion magnitude, cross-sectional size and East-West drift, with good agreement. In particular, airglow depletion depths ranged from 18 to 64% with a maximum loss in emission rate of 700 R₀ (55%) on a night when the maximum recorded airglow was almost 1700 R₀. This corresponds to an electron density depletion of about 1.5×10¹² el m⁻³ observed near solar maximum. It is somewhat higher than values reported near solar minimum. The airglow depletions move eastward with velocities ranging from 90 to 140 ms⁻¹. There is qualitative evidence of vertical motion and strong correlation with range type spread-F. (15 refs.)

94.20 PHYSICS OF THE IONOSPHERE

(for planets, see 96.30)

64286 Observations of the HF-enhanced plasma line with a 46.8-MHz radar and reinterpretation of previous observations with the 430-MHz radar.

J.A.Fejér (Max-Planck-Inst. fur Aeronomie, Katlenburg-Lindau, Germany), H.M.Ierkic, R.F.Woodman, J.Rottger, M.Sulzer, R.A.Behnke, A.Veldhuis.

J. Geophys. Res. (USA), vol.88, no.A3, p.2083-92 (1 March 1983). During 5.1-MHz HF transmissions below the F region penetration frequency by a nearby ionospheric modification facility, radar echoes coming from F region heights at a frequency of 46.8+5.1=51.9 MHz were received while a VHF radar using the 305 m spherical reflector at Arecibo was transmitting pulses coherently on 46.8 MHz. The bandwidth of the echoes was less than 10 Hz. The so-called decay line due to the parametric decay instability was expected at a frequency lower by about 300 Hz, but it was not observed. Density variations caused by the ponderomotive force resulting from the standing wave pattern at 5.1 MHz are tentatively invoked to explain the observations. Poorly understood aspects of some previous observations with the 430-MHz radar can be similarly explained. (27 refs.)

64287 Studies of the self-focusing instability at Arecibo. D.T.Farley, C.L.Hoz, B.G.Fejér (School of Electrical Engng., Cornell Univ., Ithaca, NY, USA).

J. Geophys. Res. (USA), vol.88, no.A3, p.2093-102 (1 March 1983). Precisely simultaneous radar and satellite measurements at the altitude of reflection of a strong HF heating wave above the Arecibo Observatory were made on June 7, 1977. Parametric instabilities produce strong enhancements in the plasma line and ion line incoherent scatter radar echoes. These echoes also exhibit periodic deep fading that is attributed to a self-focusing instability. This explanation was confirmed by the in situ observation of electron density fluctuations with peak-to-peak amplitudes reaching at least 3% and a spatial dependence that corresponded closely to the radar fading pattern, at least for irregularity wavelengths ranging from a few hundred meters to a few kilometers. The correspondence implies that the radar fading is associated with the convection of the density irregularities through the radar beam. (33 refs.)

64288 Density drift instabilities and weak collisions. S.P.Gary, P.A.Bernhardt, T.E.Cole (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).

J. Geophys. Res. (USA), vol.88, no.A3, p.2103-11 (1 March 1983). Describes the effects of weak collisions on the linear kinetic theory of electrostatic density drift instabilities. The model assumes a weak, uniform density gradient, a uniform magnetic field and the BGK collision operator with a modification of the local approximation to derive a dispersion equation valid at all frequencies and wave numbers. The properties of the universal and collisional density drift instabilities at maximum growth rates are presented in detail. Their thresholds in an ionospheric model, which includes ion-neutral, electron-neutral, and electron-ion collisions, are discussed and compared with the threshold of the lower hybrid density drift instability. In particular, the ionospheric conditions (plasma density $\lesssim 10^3$ cm⁻³, altitude $\gtrsim 250$ km) and maximum scale lengths necessary to excite the universal at wavelengths of the order of the ion gyroradius are presented. (28 refs.)

- 64289 A theoretical study of the high latitude F region's response to magnetospheric storm inputs.** J.J.Sojka, R.W.Schunk (Center for Atmospheric & Space Sci., Utah State Univ., Logan, UT, USA). *J. Geophys. Res. (USA)*, vol.88, no.A3, p.2112-22 (1 March 1983). The response of the polar ionosphere to magnetospheric storm inputs was modeled. During the storm the two major processes that couple the F region to the magnetosphere, namely the electric field distribution and the particle precipitation from the magnetosphere, undergo drastic modification on relatively short F region time scales. These time-dependent changes are not simply related to the F region storm time dependent changes. The lower F region responds on a time scale of only minutes to the storm associated changes in the auroral precipitating electron flux, owing to the dominance of chemistry production-loss mechanisms over transport processes. At higher altitudes in the vicinity of $h_m F_2$, the chemistry is balanced by both plasma diffusion along field lines and horizontal plasma convection, which acts to prolong the effect of the storm for many hours after it has ceased. (15 refs.)
- 64290 A dynamic model for the auroral field line plasma in the presence of field-aligned current.** H.G.Mitchell, Jr. (Sci. Applications Inc., McLean, VA, USA), P.J.Palmadesso. *J. Geophys. Res. (USA)*, vol.88, no.A3, p.2131-9 (1 March 1983). A dynamic numerical model of the plasma along an auroral field line has been developed in order to provide a vehicle for studying ionosphere-magnetosphere coupling processes. The model is a multimoment, multifluid approximation of a gyrotropic plasma consisting of three species (electrons, hydrogen ions, oxygen ions) along a segment of auroral magnetic field line extending from an altitude of 800 km to 10 Earth radii. The authors performed simulations for the case of a current-free polar wind equilibrium of the field line plasma and the case in which a large upward field-aligned current is applied to the field line. In the former case, the agreement between this model and previous static results is reasonable given the differing boundary conditions inherent in the two cases. (38 refs.)
- 64291 Ionospheric electric field pulsations: a comparison between VLF results from an ionospheric heating experiment and STARE.** M.T.Rietveld, H.Kopka, E.Nielsen, P.Stubbe (Max-Planck-Inst. fur Aeronomie, Katlenburg-Lindau, Germany), R.L.Dowden. *J. Geophys. Res. (USA)*, vol.88, no.A3, p.2140-6 (1 March 1983). Very low-frequency radio waves can be generated in the lower ionosphere by periodically modulating the conductivity, and thus natural currents, using high power HF radio waves. In conjunction with the heating facility near Tromsø, Norway, such waves have been generated and detected on the ground using two orthogonal receiving antennas so that the polarization ellipse of the VLF signal could be reconstructed. Changes in the strength and direction of the electric field driving the modulated current are reflected in variations in the size and orientation of the VLF ellipse. During a natural Pc 5 pulsation event on October 16, 1981, a close correlation was found between the VLF signal and the electric field pulsations observed by the STARE auroral radars. This work shows that VLF signals from modulated ionospheric heating experiments can provide a sensitive, high time resolution indicator of the ionospheric electric field. (9 refs.)
- 64292 Splitting and divergence of STARE auroral radar velocities.** J.D.Whitehead, H.M.Jerkic, E.Nielsen (Max-Planck-Inst. fur Aeronomie, Katlenburg-Lindau, Germany). *J. Geophys. Res. (USA)*, vol.88, no.A3, p.2147-54 (1 March 1983). A study of the power spectra of auroral radar echoes shows that they are sometimes asymmetrical. This is probably due to two waves (at different heights) having different line-of-sight velocities. The velocity splitting occurs over a limited region of space (~300 km in geographic extent) that moves toward the equator. The velocity splitting seems to be associated with divergence of the STARE drift velocities. This has been calculated and found to have significant time and space variations—much too large to be explained by magnetic field changes. The divergence is greatest at times when the power spectrum is asymmetrical and more than one velocity may be present. Several possible corrections have been tried, but none reduce the magnitude of the divergences appreciably. The authors conclude that STARE does not measure the electric field exactly and that a correction velocity of the order of 25 m s^{-1} and divergence of the order of 10^{-4} s^{-1} is required. (12 refs.)
- 64293 A simple theoretical model for calculating and parameterizing the ionospheric photoelectron flux.** P.G.Richards, D.G.Torr (Center for Atmospheric & Space Sci., Utah State Univ., Logan, UT, USA). *J. Geophys. Res. (USA)*, vol.88, no.A3, p.2155-62 (1 March 1983). A method has been developed for calculating the ionospheric photoelectron flux that uses the concept of average electron energy loss to simplify the calculation of the degraded electron spectrum. This method, which requires only a knowledge of the total inelastic electron impact cross sections, rather than a detailed knowledge of the many partial cross sections can be used for the calculation of all secondary ion and excited state production rates. It is estimated that the use of an average energy loss reduces the computation time by a factor of 10 and considerably reduces storage requirements. The simple model is designed to provide ionospheric chemistry workers with a convenient means of obtaining photoelectron spectra similar to that which is currently available for obtaining neutral densities. (25 refs.)
- 64294 Incoherent scatter observations of mid-latitude sporadic-E and comments on its data analysis.** C.J.Zamlutti (Inst. de Pesquisas Espaciais, Sao Jose dos Campos, Sao Paulo, Brazil). *J. Atmos. & Terr. Phys. (GB)*, vol.45, no.2-3, p.79-87 (Feb.-March 1983). Incoherent scatter observations of sporadic-E have been reported from measurements at Arecibo (18.3°N) in the last decade. Some important results have been achieved. They are examined in this article as a source for improving the Es study. Critical aspects of experiment design and data analysis are also considered for further experiments. (43 refs.)
- 64295 VLF ionosonde and long-distance propagation anomalies produced by galactic Cen X-4 X-ray burst in May 1979.** L.R.Piazza, P.Kaufmann (Inst. de Pesquisas Espaciais, Sao Jose dos Campos, Sao Paulo, Brazil), P.R.Pardo. *J. Atmos. & Terr. Phys. (GB)*, vol.45, no.2-3, p.121-5 (Feb.-March 1983). The galactic X-ray source Cen X-4 produced a large outburst in May 1979, measured by the Ariel-5 satellite. Low ionosphere group heights measured daily by a VLF ionosonde indicated an anomalous lowering of the effective reflection height in good correlation with the Cen X-4 burst as well as an increase in the reflection coefficient, larger for larger frequencies. Diurnal VLF phase variations in a long-distance propagation path presented nighttime 3-4° deviations from the average in some days during the Cen X-4 bursting period. The geomagnetic activity in the period covered by this investigation was low, and the results obtained are a suggested confirmation that galactic transient X-ray sources are capable of producing sufficient ionization effects to be detected as low ionosphere anomalies. (16 refs.)
- 64296 High-latitude plasma densities and their relation to riometer absorption.** M.Friedrich (Dept. of Communications & Wave Propagation, Tech. Univ. Graz, Graz, Austria), K.M.Torkar. *J. Atmos. & Terr. Phys. (GB)*, vol.45, no.2-3, p.127-35 (Feb.-March 1983). A large number of D- and E-region electron density profiles from high latitudes have been analysed. These were derived from rocket-borne wave propagation experiments and—after careful screening—arranged according to riometer absorption. Statistical profiles for various degrees of absorption, including 9 dB, were established both for day and night. Furthermore, the height region predominantly contributing to the absorption has been identified. Finally a mean variation of the density of negative ions has been derived. (23 refs.)
- 64297 Horizontal velocity dispersion of medium-scale travelling ionospheric disturbances in the F-region.** T.Shibata, T.Okuzawa (Dept. of Appl. Electronic Engng., Univ. of Electro-Communications, Tokyo, Japan). *J. Atmos. & Terr. Phys. (GB)*, vol.45, no.2-3, p.149-59 (Feb.-March 1983). Daytime observations of the horizontal velocity dispersion of medium-scale travelling ionospheric disturbances (TID) near the F_2 peak height have been carried out using an array of HF Doppler sounders in central Japan. Cross-correlation analysis of sample records has shown that the horizontal trace velocity is a decreasing function of the period of fluctuations in the range 13.3-40 min. The theoretical dispersion of the atmospheric gravity waves is also calculated using Klostermeyer's (1974) method. Comparison between the observed and the calculated results suggests the possibility that the components of the lower period of the observed velocity dispersion may be a remnant of the quasi-evanescent mode pertinent to lower-height levels. (44 refs.)
- 64298 Prediction of total electron content using the International Reference Ionosphere.** L.F.McNamara, P.J.Wilkinson (Dept. of Sci. & Technol., Ionospheric Prediction Service, Darlinghurst, Australia). *J. Atmos. & Terr. Phys. (GB)*, vol.45, no.2-3, p.169-74 (Feb.-March 1983). Comparisons are presented between the values of total content (TEC) observed at 31°S and those predicted using the Australian Ionospheric Prediction Service's version of the International Reference Ionosphere. Although discrepancies sometimes exceed 30% they are usually less than 20%. The predicted TEC values tend to be too low in daytime summer, too high in daytime winter, and have an incorrect diurnal variation during winter days. Although the predicted TEC was sensitive to the errors in the f_oF_2 values used, the major discrepancies remained. (10 refs.)
- 64299 Auroral riometer absorptions and the F-region disturbances observed over a wide range of latitudes.** L.A.Hajkowicz (Dept. of Phys., Univ. of Queensland, St. Lucia, Queensland, Australia). *J. Atmos. & Terr. Phys. (GB)*, vol.45, no.2-3, p.175-9 (Feb.-March 1983). Standard riometer data from a southern auroral station were compared with ionograms obtained at five stations positioned from sub-auroral to equatorial latitudes. The rapid onset in riometer absorption, during intense substorm activities in an equinoctial period, was associated with a sequential propagation of ionospheric disturbances deduced from the F-region parameters $h'F$ and range spread-F. The time shift between absorption maxima and extrapolated commencement times of the disturbances was consistent with the presence of large-scale travelling ionospheric disturbances (TIDs), propagating equatorwards with velocities lying typically in the range 600-900 m s^{-1} , and with a median velocity of 720 m s^{-1} . It is suggested that the onset of TIDs is associated with high-energy particle precipitation, manifested by the occurrence of auroral absorption events. The results indicate that large-scale TIDs are simultaneously generated in both hemispheres. (22 refs.)
- 64300 Generation of ionospheric irregularities by thermal-source: a new mechanism.** U.N.Das (Dept. of Maths., Gauhati Univ., Gauhati, Assam, India), A.C.Das. *Planet. & Space Sci. (GB)*, vol.31, no.3, p.311-16 (March 1983). A new mechanism for the generation of ionospheric irregularities of scale sizes of the order of 100 m or more, has been developed on the basis of a thermal energy source due to collisional current dissipation. An important role is played by the diffusion of particles along and across the magnetic field. A threshold condition for the instability has been obtained and it is shown that these irregularities can be generated in the F-region height of the auroral ionosphere when the electric field is enhanced to about 10 mV m^{-1} . (27 refs.)
- 64301 Nonlinear phenomena in laboratory and space plasmas.** A.Y.Wong (Dept. of Phys., Univ. of California, Los Angeles, CA, USA). *Phys. Scr. (Sweden)*, vol.T2, no.1, p.262-70 (1982). (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982). Laboratory observations of wave trapping and generation of density cavities verified quantitatively the predictions of the nonlinear Schrodinger equation. Recent observations on the resonant interactions between electromagnetic waves and ionospheric plasmas are interpreted as first tentative evidence for the existence of cavitons in the ionosphere. (7 refs.)
- 64302 Changes in the field intensity of radio signals and noise during the total solar eclipse of 16 February 1980 in relation to ionospheric radio wave propagation.** A.K.Sen, B.Saha, S.K.Trehan, S.Sekhar Dey, S.K.Saha, R.N.Dutta, S.K.Chatterjee, J.S.Sehra, M.K.Das Gupta (Centre of Advanced Study in Radio Phys. & Electronics, Calcutta, India). *Proc. Indian Natl. Sci. Acad. Part A*, vol.48, suppl.3, p.302-7 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981). Various scientific observations for the studies on the ionospheric propagation of radio signals and noise in the VLF to HF bands were made at different Indian locations in umbral and penumbral regions of the solar eclipse on 16 February 1980. Analysis of the results indicates that, in general, there is an improvement of radio propagation during the eclipse. Some evidence of travelling ionospheric disturbances apparently related to the eclipse is indicated. A peculiar absorption of signal starting even before the first contact has been observed. The results obtained are compared with other eclipse results and critically examined in the light of the current knowledge about the mechanisms of the ionospheric changes involved, including the gravity wave perturbations. (15 refs.)
- 64303 Multi-station monitoring of short and medium wave broadcast circuits during solar eclipse of 16 February 1980.** D.R.Lakshmi, B.M.Reddy (Nat. Phys. Lab., New Delhi, India), R.Chakravarthy, M.Sain. *Proc. Indian Natl. Sci. Acad. Part A*, vol.48, suppl.3, p.308-15 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981). During the 16 February 1980 total solar eclipse, several short wave and medium wave broadcasts of All India Radio were monitored at several locations on either side of the path of totality, the disposition of the stations so chosen as to locate the control points of the circuits in the totality path. Special mention may be made of the short wave transmissions at 15.25 MHz from Delhi and 9.55 MHz from Bombay which were monitored at Madras and Trivandrum. In addition, a few medium wave transmissions also were

monitored so that information can be derived on the change in the pattern of field intensity recording with change in the altitude of the control points. Ionosondes were specially pressed into operation for this event at two stations located in the totality zone. It was observed that the increase in the signal intensities during the totality is higher than the total ionospheric absorption given by the CCIR formula. This indicates that the CCIR formula underestimates the ionospheric absorption by as much as 12 dB in certain cases. (8 refs.)

64304 Ionospheric radio effects of the solar eclipse on 16 February 1980. K.G.Jani, G.Datta, D.B.Patel, K.M.Kotadia (Dept. of Phys., Gujarat Univ., Ahmedabad, India).
Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.316-24 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

The solar eclipse at Karwar (14.6°N, 74°E) was total for about 2 1/2 minutes around 1540 hr IST and this place happens to be the midpoint of one-hop Colombo-Ahmedabad ionospheric radio propagation path. The field strength of radio signals on 11.8 MHz transmitted from Radio Sri Lanka and received at Ahmedabad showed an increase of about 23 dB above the normal value and the maximum of increase occurred during the totality of the solar eclipse. This effect was clearly noticed in spite of the fact that the eclipse day was magnetically disturbed. At Ahmedabad (23°N, 72.6°E) where the solar eclipse was about 75 per cent at its maximum phase around 1541 hr IST, vertical incidence A1-ionospheric radio pulse absorption on 2.2 and 1.8 MHz reduced to half of its normal value (22-25 dB) with a time-delay of about 18 minutes following the maximum phase. The above results are discussed in relation to the changes in the ionisation in the lower ionosphere and the modes of oblique path radio propagation associated with the obscuration of solar radiation during the eclipse. (10 refs.)

64305 Effects of solar eclipse on shortwave transmissions. E.P.Radhakrishnan, N.Balan (Dept. of Phys., Univ. of Kerala, Trivandrum, India), A.A.Sridhar, K.Usha Devi.
Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.325-33 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

The effects of solar eclipse on long distance communications have been studied by monitoring the Delhi shortwave transmissions on 15.25 MHz at Trivandrum during the total solar eclipse of 16 February 1980. Signal strength shows a maximum enhancement of 30 dB 15 minutes before the maximum phase of the eclipse at the path mid-point. During the beginning of the eclipse the signal strength remains steady around the control day value for 20 minutes after the first contact while at the end of the eclipse it falls sharply to the control day value. Signal fading rate is very high at the beginning and at the end of the eclipse while it is very low during the maximum phase of the eclipse. Probability distribution of the signal strength exhibits a double hump during the eclipse period. The results are interpreted in terms of the possible changes in the lower ionosphere and at the reflection level by means of model computations for Delhi-Trivandrum propagation path. (12 refs.)

64306 Ionospheric absorption changes in 11.8 MHz radio propagation during the total solar eclipse of 16 February 1980. G.Rajaram, T.R.Rao, D.D.Patil (Indian Inst. of Geomagnetism, Bombay, India).
Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.334-41 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

Variations in the 11.8 MHz signal strength (Colombo-Bombay propagation path) during the total solar eclipse of 16 February 1980 are interpreted in terms of possible changes in the lower ionosphere. The main features observed are a sharp rise of almost 20 dB following onset of the eclipse, followed by two distinct drops in signal strength which were separated by a brief interval of enhanced signal; a marked rise in the received signal was also noticed about an hour before first contact. The eclipse night was characterised by regular, periodic fading which is not a normal night-time feature for this propagation path. These eclipse-induced changes are discussed in the light of astronomical and ionospheric observations of this same eclipse reported by other workers. (23 refs.)

64307 Solar eclipse effects on the lower ionosphere. R.Venkatanarayana, T.S.N.Somayaji (Dept. of Phys., Andhra Univ., Waltair, India).
Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.375-9 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

Short term fluctuations in ionospheric first order echo amplitude at Waltair are investigated for eclipse effects. Power spectrum analysis of short term fluctuations during the period 1500-1630 hours on 16 February 1980 when a near total solar eclipse (99 per cent) occurred showed periods with a lower cut-off period equal to 6.75 minutes significantly higher than the cut-off period of 5.25 minutes for the corresponding period on 15 February 1980 taken as the control day. The group height was found to increase from 110 km just before the eclipse to an average of 127.5 km around the middle of the eclipse period. The larger cut-off period on the eclipse day is attributed to the increase in the altitude level of region where most of the ionospheric absorption is caused. Neglecting the effect of neutral winds and assuming the absence of significant ionization at the D-region heights during a near total eclipse, it is inferred that the temperature at an altitude of about 127.5 km is significantly lowered during the eclipse. (8 refs.)

64308 A1 absorption measurements during the total solar eclipse of 16 February 1980. U.V.Girish Kumar, K.V.V.Ramana (Ionosphere & Space Res. Labs., Andhra Univ., Waltair, India).
Proc. Indian Natl. Sci. Acad. Part A, vol.48, suppl.3, p.380-7 (Oct. 1982). (Symposium on the Total Solar Eclipse of 16 February 1980, New Delhi, India, Jan. 1981).

A1 absorption measurements taken during the total solar eclipse of 16 February 1980 at a frequency of 2.4 MHz are used to obtain the temporal variation of $N_m E$ at 105 km and $R_m D$ at 75 km. The contributions from E- and D-regions to the total absorption are also computed and it is found that during the time of near totality the contributions are approximately equal. The decrease in the total absorption from the time of beginning of the eclipse to the time of minimum absorption is about 25 dB with a time lag of 9 minutes. A 30 per cent decrease in $N_m E$ and a 70 per cent decrease in $N_m D$ with time lags of 9 minutes and 19 minutes, respectively, are noted in the temporal variations of $N_m E$ and $N_m D$ during the time of eclipse. The contributions from the uniform solar disc, solar corona and active regions distributed over the solar disc to the total absorption are 45 per cent, 25 per cent and 20 per cent respectively. (7 refs.)

64309 Correlation of seasonal structural transformations of the F region of the ionosphere and the circulation in the stratosphere. V.F.Chepura (Inst. of Experimental Meteorology, USSR).
Sov. Meteorol. & Hydrol. (USA), no.1, p.38-41 (1982). Translation of: *Meteorol. & Hydrol. (USSR)*, no.1, p.49-53 (1982).

Studies the monthly-average midday values of the critical frequencies of the F₂-layer over Moscow, Leningrad, and Ottawa in the period 1958-80. The dates of the spring and fall structural transformations of the F-region over the middle Northern Hemisphere average 4-6 weeks earlier than in the stratospheric circulation. The spring restructuring of the F-region precedes that of the meteor-zone circulation by an average of two weeks. (8 refs.)

64310 Temperature of the plasmasphere determined from VLF observations at SANAÉ. A.R.W.Hughes, B.Nugent (Dept. of Phys., Univ. of Natal, Durban, S Africa).

S. Afr. J. Phys. (S. Africa), vol.5, no.4, p.123-7 (1982). A new method is employed to determine plasma temperatures in the plasmasphere. The method assumes that the plasma is in diffusive equilibrium. Electron densities at two points on each field line are used to calculate a scale height and hence the temperature of the plasma. The temperatures are determined at high altitudes where, because of low densities, conventional probe techniques do not work well. (17 refs.)

64311 The minimum detectable value of wave vector component parallel to the magnetic field of trapped cyclotron harmonic waves. T.Utsunomiya (Dept. of Electrical Engng., Nat. Defense Acad., Yokosuka, Japan).
Trans. Inst. Electron. & Commun. Eng. Jpn. Part B (Japan), vol.66B, no.1, p.155-6 (Jan. 1983). In Japanese.

Shows that the cyclotron harmonic waves trapped near the magnetic equator plane, to be received by a topside sounder spacecraft, have the minimum value for their wave vector component parallel to the magnetic field, depending on the direction of the orbit of the spacecraft. (2 refs.)

94.30 PHYSICS OF THE MAGNETOSPHERE

(for planets, see 96.30)

64312 Plasma rest frame frequencies and polarizations of the low-frequency upstream waves: ISEE 1 and 2 observations. M.M.Hoppe, C.T.Russell (Inst. of Geophys. & Planetary Phys., Univ. of California, Los Angeles, CA, USA).

J. Geophys. Res. (USA), vol.88, no.A3, p.2021-7 (1 March 1983). Using magnetic field data from the dual ISEE 1 and 2 spacecraft the authors have determined the plasma rest frame frequencies and polarizations of the large amplitude low frequency (0.03 Hz) upstream waves. The monochromatic sinusoidal waves associated with 'intermediate' ion fluxes are magnetosonic waves with rest frame frequencies $\sim 0.1 \Omega_p$ and wavelengths $\sim 1 R_E$. The obliquely propagating 'shocklet' form of the waves is also predominantly in the magnetosonic mode, but occasionally also appears in the Alfvén mode. The generation of the magnetosonic mode has been explained by the well established cyclotron resonance mechanism driven by narrow reflected ion beams but the concurrent observation of Alfvén mode waves appears to require wave generation by the more isotropic diffuse ion distributions as well. (17 refs.)

64313 Solar wind deceleration and MHD turbulence in the Earth's foreshock region: ISEE 1 and 2 and IMP 8 observations. C.Bonifazi, G.Moreno (Inst. Plasma Spazio, Consiglio Nazionale delle Ricerche, Frascati, Italy), C.T.Russell, A.J.Lazarus, J.D.Sullivan.

J. Geophys. Res. (USA), vol.88, no.A3, p.2029-37 (1 March 1983). The interaction of the solar wind with ions backstreaming from the Earth's bow shock is investigated using plasma and magnetic field measurements on ISEE 1 and 2 and IMP 8 at widely separated positions in the Earth's foreshock. This technique separates temporal and spatial variations within the foreshock. It is found that the solar wind acceleration associated with backstreaming ions is correlated with the amplitude of the MHD turbulence and that the largest decelerations are seen close to the bow shock. The density of the backstreaming ion beam is strongly correlated with distance from the shock and decreases by about a factor of 3 in a distance of about 3 R_E . (26 refs.)

64314 Ions upstream of the Earth's bow shock: a theoretical comparison of alternative source populations. S.J.Schwartz, M.F.Thomsen, J.T.Gosling (Univ. of California, Los Alamos Nat. Lab., Los Alamos, NM, USA).

J. Geophys. Res. (USA), vol.88, no.A3, p.2039-47 (1 March 1983). A theoretical framework is developed for studying trajectories of ions reflected or leaked upstream from the Earth's bow shock and subject to the Lorentz force in a steady interplanetary magnetic field **B** and the $\mathbf{V} \times \mathbf{B}$ electric field. The effects of a sharp shock potential rise are included. Expressions are derived for the guiding center motion and gyromotion in a frame (the Hoffman-Teller frame) moving parallel to the shock surface with sufficient speed to transform the incident solar wind velocity into motion entirely along the interplanetary magnetic field; the appropriate equations are also provided to transform these motions back to the observer's frame. The utility of these expressions is illustrated by comparing the predicted upstream motions for four different source models for upstream ions: magnetic moment-conserving reflection of solar wind ions; specular reflection of solar

wind ions; magnetic moment-conserving leakage of magnetosheath ions; and leakage of magnetosheath ions parallel to the shock normal. (34 refs.)

64315 The oblique whistler instability in the Earth's foreshock. D.D.Sentman (Inst. of Geophys. & Planetary Phys., Univ. of California, Los Angeles, CA, USA), M.F.Thomsen, S.P.Gary, W.C.Feldman, M.M.Hoppe. *J. Geophys. Res. (USA)*, vol.88, no.A3, p.2048-56 (1 March 1983). The linear Vlasov stability properties of electron velocity distributions, similar to those observed in the upstream foreshock region in association with obliquely propagating whistler waves at approximately 1 Hz, are studied. These distributions are modeled by a sum of bi-Maxwellians with drift speeds parallel to the magnetic field B . Such distributions are found to be stable to modes with wavevectors k parallel to B but unstable to whistler waves propagating obliquely to the magnetic field. The frequencies and wavelengths of these unstable modes agree well with those of whistlers observed upstream of the Earth's bow shock. (48 refs.)

64316 Mass composition of substorm-related energetic ion dispersion events. R.J.Strangeway, R.G.Johnson (Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA). *J. Geophys. Res. (USA)*, vol.88, no.A3, p.2057-64 (1 March 1983). The Lockheed ion mass spectrometer flown onboard the SCATHA (P78-2) spacecraft is used to study the mass composition of two ion dispersion events. The energy-dispersed ions are observed over the full energy range of the instrument (0.1-32 keV/q) in the noon-dusk local time sector. On one of the days, March 22 (day 81) 1979, the dispersing ions are first observed following an isolated substorm. A long period of low magnetic activity is present prior to the substorm on this day, and a decrease in Dst is observed following the first observation of the dispersing ions. On the second day studied, June 7 (day 158), 1979, the correlation between ground magnetic activity and initial observation of dispersing ions is not so clear, since the dispersion follows a period of high magnetic activity. The differences between proton and oxygen dispersion are studied. Localised injection of ionospheric plasma are responsible for the composition changes. Pitch angle studies were also made. (21 refs.)

64317 High- β theory of low-frequency magnetic pulsations. S.Migliuolo (High Altitude Obs., Nat. Center for Atmospheric Res., Boulder, CO, USA). *J. Geophys. Res. (USA)*, vol.88, no.A3, p.2065-73 (1 March 1983). The theory of low-frequency (compared to ion cyclotron) arbitrary- β modes is developed for the following system: a two-component (hot and cold) inhomogeneous plasma, and a straight inhomogeneous magnetic field. This system is taken to model the magnetosphere, near the geomagnetic equator. The stability properties of three modes are presented in detail: the drift-compressional mode (driven by pressure gradients) the firehose mode (driven by $T_{\perp} > T_{\parallel}$), and the drift mirror mode (driven by $T_{\perp} > T_{\parallel}$). Comparisons to earlier models and to one observed event are also presented. (32 refs.)

64318 Pc 1 pulsation activity at Ottawa. J.C.Gupta (Div. of Geomagnetism, Earth Phys. Branch, Energy, Mines & Resources, Ottawa, Canada). *J. Geophys. Res. (USA)*, vol.88, no.A3, p.2075-82 (1 March 1983). Pulsations in the Pc 1 period range recorded at Ottawa for three years during the IMS are analyzed to study some of their occurrence characteristics. The diurnal occurrence pattern depends on the seasons and on the prevailing magnetic activity conditions. In both cases the morning peak shifts to earlier hours and the evening peak shifts to later hours with increasing conduction (electron density) in the ionosphere. The largest number of events were recorded in the winter months and about as many in the equinoctial months. A large majority of the events are inferred to occur, at Ottawa, during the recovery phase of magnetic storms. The enhancements of Pc 1's noted at different levels of magnetic activity seem to be controlled by the location of the plasmopause and also by the propagation conditions in the ionosphere. (43 refs.)

64319 Solar wind control of the low-latitude asymmetric magnetic disturbance field. C.R.Clauer (Space Telecommunications & Radioscience Lab., Stanford Univ., Stanford, CA, USA), R.L.McPherron, C.Searls. *J. Geophys. Res. (USA)*, vol.88, no.A3, p.2123-30 (1 March 1983). The technique of empirical linear prediction filters is used to investigate the extent to which the low latitude dawn-dusk magnetic asymmetry is controlled by the dawn-dusk solar wind motional electric field V_B , and/or by substorm processes measured by the westward auroral electrojet index AL . The dawn-dusk asymmetry is measured by a new index defined as the difference between dawn and dusk deviations in the X (geomagnetic Northward) magnetic field component. The empirically determined filters obtained from this analysis provide quantitative information which characterizes the coupling processes. For example, the V_B to AL filter is a delayed pulse beginning after a delay of about 15 minutes, peaking at 60 minutes and returning to zero at 120 min. The filter has the characteristics of a low pass filter with a cutoff frequency at 10^{-4} Hz. The V_B to ASYM filter is also a delayed pulse with similar constants. (23 refs.)

64320 Convective growth rate of ion cyclotron waves in H^+ - He^+ and H^+ - He^+ - O^+ plasma. L.Gomberoff, R.Neira (Dept. de Fisica, Univ. de Chile, Santiago, Chile). *J. Geophys. Res. (USA)*, vol.88, no.A3, p.2170-4 (1 March 1983). The behavior of the convective growth rate of the electromagnetic proton-cyclotron instability is investigated in detail in a H^+ , He^+ plasma and when a third (minority) cold ion component such as O^+ is taken into account. It is shown that amplification is the result of an interplay between the cold species and the thermal anisotropy of the energetic protons. The results seem to be in good agreement with the observations performed on board GEOS 1 and 2 concerning the generation of ULF waves, below the proton gyrofrequency. It is also shown that a small amount of O^+ can strongly affect the behavior of the convective growth rate of the instability below the He^+ gyrofrequency, even far away from the O^+ stop band. (13 refs.)

64321 Satellite observations of signals from a Soviet mid-latitude VLF transmitter in the magnetic-conjugate region. V.I.Larkina, O.A.Maltseva, O.A.Molchanov (Inst. of Terrestrial Magnetism, Ionosphere & Radio Wave Propagation, Acad. of Sci., Moscow, USSR). *J. Atmos. & Terr. Phys. (GB)*, vol.45, no.2-3, p.115-19 (Feb.-March 1983). The results of the Intercoms-19 satellite experiment which receives VLF signals arriving via a magnetospheric path have been examined. The reception zone in the magnetically conjugate region (MCR) has been shown to be centred near the L-value (2.6) of the transmitter of 15 kHz radio waves. The received signals arrive at the MCR with wave normal angles to the geomagnetic field, ψ , far from the resonance cone. These results indicate an effective amplification of the signal in the magnetosphere by 10-15 dB and effective ducting of VLF waves across the equatorial plane of the magnetosphere. (14 refs.)

64322 Whistler observations of magnetospheric electric field in the night side plasma-sphere at low latitude. P.N.Khosa, M.M.Ahmad, Lal Mani (Dept. of Phys., Regional Engng. Coll., Srinagar, Kashmir, India). *Moon & Planets (Netherlands)*, vol.27, no.4, p.453-62 (Dec. 1982). Whistlers recorded at low latitude ground stations of Gulmarg, Nainital and Varanasi were used to infer the east-west component of electric field on the nightside plasmasphere at $L=1.2, 1.12$, and 1.07 during magnetic storm periods. The method of measuring electric field from the observed cross-L motions of whistler ducts within the plasma-sphere, indicated by changes in nose frequency of whistlers, is outlined. The nose frequencies of the nonnose whistlers under consideration are deduced from the Dowden-Allocock linear Q-technique. (20 refs.)

64323 Generation of Alfvén waves in an anomalous resistivity region. A.A.Arykov, Yu.P.Maltsev (Polar Geophys. Inst., Apatity, USSR). *Planet. & Space Sci. (GB)*, vol.31, no.3, p.267-73 (March 1983). Studies disturbances produced by a field-aligned current flowing through a thin layer with a finite conductivity along the magnetic field. The layer conductivity is an arbitrary function of transverse coordinates and time. It is shown that a suddenly emerging layer of the anomalous resistivity in the region of the auroral field-aligned currents leads to a generation of an Alfvén impulse with an amplitude up to 100 gammas. All electromagnetic disturbances appear to be localized inside the magnetic field tube passing through the anomalous resistivity region. An attempt to hinder the field-aligned current with an insulator does not stop the current, but forces it to flow round the insulator. (15 refs.)

64324 Excitation of an electrostatic wave by a cold electron current sheet of finite thickness. K.S.Hwang, E.G.Fontheim, R.S.B.Ong (Dept. of Atmospheric & Oceanic Sci., Univ. of Michigan, Ann Arbor, MI, USA). *Planet. & Space Sci. (GB)*, vol.31, no.3, p.285-93 (March 1983). Electrostatic waves excited by a field-aligned electron current sheet of finite thickness are investigated. The finite width of the current sheet gives rise to boundary conditions to be satisfied at the sheet edge. This results in a restriction to the number of modes which may be driven unstable. Ducted and evanescent mode solutions are obtained. It is shown that the finite thickness of the current sheet partially stabilizes the system and contributes to the coherence of the excited waves. (17 refs.)

64325 Pc1 wave generation by sudden impulses. J.V.Olson, L.C.Lee (Geophys. Inst., Univ. of Alaska, Fairbanks, AK, USA). *Planet. & Space Sci. (GB)*, vol.31, no.3, p.295-302 (March 1983). Induction magnetometer data recorded at College, Alaska have been studied for the occurrence of ULF emissions associated with sudden impulses (SI). In this study the authors surveyed three years of data (1977-1979 inclusively) and found that for the 76 SIs reported in IAGA bulletins, 32 were found to be followed by ULF emissions in the College data. While the 76 SIs occurred at all local times those which were associated with ULF emissions at College peaked in occurrence near local noon. These observations are interpreted in terms of a simple model based upon a Chapman-Ferraro double-dipole model of the magnetosphere. Using this model an estimate of field compressions associated with SIs can be made and from this the increases in the temperature anisotropy and plasma beta may be estimated. This simple model predicts maximum growth rate near noon on high latitude field lines, just inside the magnetopause. Further, inspection of growth rate curves for varying plasma anisotropy and beta leads to the conclusion that an increase in anisotropy is the primary cause of the ULF emissions observed. (15 refs.)

64326 Quarter-wave ULF pulsations. W.Allan (Phys. & Engng. Lab., DSIR, Lower Hutt, New Zealand). *Planet. & Space Sci. (GB)*, vol.31, no.3, p.323-30 (March 1983). Recent theoretical work has predicted the possible existence of 'quarter-wave' ULF pulsation resonances, in which the wave electric field has a near-node in one ionosphere and an antinode in the conjugate ionosphere. Eigenvalues are derived for quarter-wave toroidal and guided poloidal resonances for a range of L-values and plasma density distributions. From these eigenvalues, resonant periods can be obtained. Three pulsation events with anomalously long periods (when interpreted as half-waves) are examined in the light of these results. It is decided that only one event is a good candidate for quarter-wave status; this event seems likely to be a driven resonance effectively in the quarter-wave guided poloidal mode. (28 refs.)

64327 The self-focusing of whistler waves. V.I.Karpman, R.N.Kaufman (IZMIRAN, Moscow, USSR). *Phys. Scr. (Sweden)*, vol.T2, no.1, p.252-61 (1982). (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982). A general Schrodinger equation describing the propagation of whistler waves along the magnetic field is obtained. On the basis of this equation and the magnetohydrodynamic plasma equations supplemented by the ponderomotive force of the whistler wave field, the self-focusing of whistler waves is considered. A family of stationary solutions describing the structures of self-focused wave beams both in density crests and troughs is found. It is shown that the beam propagating in density crest decays due to the wave tunnelling. Therefore, only the density troughs may result from the well-developed self-focusing of whistler wave parallel to the magnetic field. (16 refs.)

64330 Gamma astronomy of the Sun and study of solar cosmic rays. B.M.Kuzhevskii (M.V. Lomonosov Moscow State Univ., Moscow, USSR). *Sov. Phys.-Usp. (USA)*, vol.25, no.6, p.392-408 (June 1982). Translation of: *Usp. Fiz. Nauk (USSR)*, vol.137, no.2, p.237-65 (June 1982). [received: April 1983]

A detailed discussion is given of the various nuclear reactions proceeding in the Sun's atmosphere under the influence of flare-accelerated particles. The role of such reactions in formation of the line spectrum and continuum of gamma-rays from the distributed and quiet Sun is discussed. The gamma-ray fluxes in individual lines and in the continuum are estimated. The possibility of applying data on gamma-ray emission from the Sun to analysis of particle acceleration in solar flares and the conditions of their ejection into interplanetary space is analyzed. 64331 Neutron fraction in primary cosmic rays inferred from muon charge ratio. K.Kinoshita, A.Kuwazuru (Phys. Dept., Kagoshima Univ., Kagoshima, Japan).

Prog. Theor. Phys. (Japan), vol.69, no.1, p.354-7 (Jan. 1983).
The μ^+/μ^- ratio at sea level was calculated by using detailed parameterization of the accelerator data and the quark model for K^+ production from neutron beam. Quite a large fraction ($\approx 30\%$) of neutrons in primary flux is required to explain the observed ratio, if some unknown mechanisms are not introduced. (18 refs.)

64332 Theory of cosmic ray spectra. V.N.Tsytoich (P.N. Lebedev Phys. Inst., Moscow, USSR).

Phys. Scr. (Sweden), vol.T2, no.2, p.562-70 (1982). [received: April 1983]
(1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

A new theory of cosmic ray spectra is presented which predicts the energy spectra for cosmic ions and electrons $\sim 1/\epsilon$, up to the highest possible ϵ in the spectra with the value of $\gamma=3$ very close to that observed (ϵ is the particle energy). The theory shows that the He^3 cosmic ions are preferentially created as compared to He^4 cosmic ions in coincidence with observations. The theory shows that the abundance of heavy ions in cosmic rays with $Z>20$ should be two orders of magnitude larger than the abundance of these elements in usual matter with agreement to observations. The theory gives the subcosmic ray ($\ll mc^2$) spectra $\sim 1/\epsilon$ (ϵ is the kinetic energy) and gives also the increase of the abundances or nonrelativistic but superthermal He^3 ions as compared to He^4 ions, which could be used to explain the increase in the abundances of He^3 in active solar regions. There are not any ad hoc assumptions in the theory; it is based on the well established resonant wave particle interactions in turbulent plasmas and especially the radiative effects in these interactions. (16 refs.)

64333 On the nature of low-energy antiprotons in cosmic rays. F.A.Agaronyan, S.R.Kel'ner, Yu.D.Kotov.

Pis'ma v Astron. Zh. (USSR), vol.9, no.2, p.102-7 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*

A model of the formation of the cosmic ray antiproton spectrum in a plasma consisting mainly of electron-positron pairs ($n_+ \approx n_- \gg 10$) is considered. Additional energy losses due to Coulomb collisions in the plasma provide significant increases of the antiproton flux in the energy range ≤ 1 GeV. (19 refs.)

64334 Condensation nuclei events at 30 km and possible influences of solar cosmic rays. D.J.Hofmann, J.M.Rosen (Dept. of Phys. & Astron., Univ. of Wyoming, Laramie, WY, USA).

Nature (GB), vol.302, no.5908, p.511-14 (7 April 1983).
Two recent observations have provided the basis for study of a relationship between solar activity and the formation of small particles in the Earth's atmosphere: the discovery of annual increases of condensation nuclei (CN) at 30 km and the detection of sulphuric acid molecules in large negative ion clusters in the 25-35 km altitude region. These observations have now led the

authors to formulate and test a model wherein CN are formed in a 'polar cloud chamber' supersaturated with sulphuric acid vapour and triggered by ionisation associated with solar flare cosmic radiation. The authors conclude that such a model provides a potential explanation of the observations. (15 refs.)

64335 Acceleration of low-energy protons and alpha particles at interplanetary shock waves. M.Scholer (Max-Planck-Inst. fur Phys. & Astrophys., Inst. fur Extraterrestrische Phys., Garching, Germany), F.M.Ipavich, G.Gloeckler, D.Hovestadt.

J. Geophys. Res. (USA), vol.88, no.A3, p.1977-88 (1 March 1983).

Low-energy protons and alpha particles have been investigated in the energy range 30 keV/charge to 150 keV/charge associated with three different interplanetary shock waves in the immediate preshock and postshock region. The data were obtained with the Max-Planck-Institut/University of Maryland sensor system on ISEE 3. In particular, the authors studied spatial distributions in the preshock and postshock medium as measured in the spacecraft frame and after transformation into the solar wind and the shock frame of reference, respectively, the dependence of the phase space density at different energies on distance from the shock, and the form of the distribution function of both species immediately at the shock. In the preshock region particles are flowing in the solar wind frame of reference away from the shock and in the postshock medium the distribution is more or less isotropic in this frame of reference. The mechanisms responsible for particle acceleration are discussed. (48 refs.)

64336 Jovian modulation of interplanetary electrons as observed with Voyagers 1 and 2. A.W.Schardt, F.B.McDonald, J.H.Trainor (Lab. for High Energy Astrophys., NASA Goddard Space Flight Center, Greenbelt, MD, USA).

J. Geophys. Res. (USA), vol.88, no.A3, p.1989-2000 (1 March 1983).

The release of magnetospheric electrons from Jupiter into interplanetary space is modulated by the Jovian rotation period. This effect was initially discovered by Pioneer 10, and the Voyager 1 and 2 observations permit a more detailed study of this modulation. It was found that the modulation period agrees on the average with the synodic period of Jupiter (9 h 55 min. 33.12 s), but over intervals of weeks it can differ from the synodic period by several minutes. The lack of exact synchronization is attributed to changes of the plasma population in the Jovian magnetosphere. Such changes affect the magnetic field sweep-back and departure from exact corotation. However, the magnetospheric asymmetry, which is responsible for the modulation, is always re-established at the same longitude. Thus no long term departures occur from the synodic period. The Jovian modulation appears to be a persistent feature of the interaction between the solar wind and the magnetosphere, and the disappearance of the modulation away from Jupiter is attributed to interplanetary propagation conditions. 64337 On the choice of artificial satellites by their optimal location data for studying the Earth's rotation. V.T.Taradiy, G.T.Yanovitskaya.

Astrometriya & Astrofiz. (USSR), no.47, p.76-9 (1982). In Russian.
Numerical modeling of the influence of perturbing accelerations upon the parameters of satellite motion show that the high altitude satellites are the best for studying the Earth's rotation. (3 refs.)

64338 The HIPPARCOS space astrometry mission. M.A.C.Perryman (Space Sci. Dept., ESA, ESTEC, Noordwijk, Netherlands).
Adv. Space Res. (GB), vol.2, no.4, p.51-8 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

The scientific aim of ESA's space astrometry mission HIPPARCOS is the accurate determination of astrometric data for a large number of celestial bodies. A complete survey of all stars down to about $B=8.9$ mag is presently anticipated, along with a selection of stars down to the limiting magnitude of about $B=13$ mag, chosen by virtue of their particular astrometric or astrophysical importance. At the same time a supplementary stellar catalogue, TYCHO, will be generated. This will contain astrometric data (positions tied to the HIPPARCOS system with an accuracy of 0.05 arcsec or better) and photometric data for all stars down to about $B=11.2$ mag, thus comprising some 400000 or more additional stars. A summary of the principal scientific objectives, a description of the payload, and an overview of the scientific coordination and of the processing of the scientific data is presented. (3 refs.)

64339 Planned NASA space infrared astronomy experiments. G.G.Fazio (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).
Adv. Space Res. (GB), vol.2, no.4, p.97-106 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

A summary is presented of the present status of the NASA space infrared astronomy program. Projects described include the Infrared Astronomy Satellite (IRAS), Small Infrared Telescope on Spacelab 2 (IRT), Cosmic Background Explorer (COBE), Shuttle Infrared Telescope Facility (SIRTF), Space Telescope (ST), and the Large Deployable Reflector (LDR). The important technical developments achieved in these programs are also discussed, as well as critical needs for future missions. (17 refs.)

64340 The Comet Halley flyby IR sounder 'IKS'. M.Arduini (Lab. de Phys. Stellaire et Planetaire, Verrieres-le-Buisson, France), J.P.Bibring, S.Cazes, M.Combes, N.Coron, J.F.Crifo, T.Encrenaz, R.Gispert, D.Harduin, J.M.Lamarre, D.Malaisé.

Adv. Space Res. (GB), vol.2, no.4, p.113-22 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

An infrared sounder is being developed in France to observe in 1986 Comet Halley from the Soviet 'VEGA' flyby probes. The instrument called 'IKS' has three measuring channels. Two of these channels will provide the spectrum of the comet emission in the spectral intervals 2.5-5.0 μ and 6-12 μ , at a constant resolution $\lambda/\Delta\lambda=50$. The third channel analyzes the comet I.R. image at a spatial frequency of about 1 arc minute⁻¹. It is hoped that (1) most primary simple molecules emitted by the nucleus will be identified; (2) the chemical composition and perhaps crystalline structure of the dust grains and ices released by the comet will be derived; and (3) the diameter of the nucleus and its brightness temperatures will be measured. (6 refs.)

64341 GIRL—the German Infrared Laboratory for Spacelab. D.Lemke (Max-Planck-Inst. Astron., Heidelberg, Germany), M.Grewing, D.Offermann, S.Drapatz, Klipping, G..

Adv. Space Res. (GB), vol.2, no.4, p.123-30 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

GIRL is a liquid helium cooled 50 cm telescope equipped with four focal plane instruments dedicated to astronomical and aeronomical observations. These instruments, a detector array, a photopolarimeter, an Ebert-Fastie-spectrometer and a Michelson-interferometer make up an 'infrared observatory'; having high sensitivity and high spectral and spatial resolution. Si:Ga-, Si:Sb-, Si:As-, Si:P-, Ge:Be-, Ge:Cu- and Ge:Ga-detectors with NEP-values as low as 3×10^{-17} W Hz^{-1/2} have been tested and will be used to cover the wavelength range 3..120 μ m. A full size 'thermal model' of the GIRL cryostat containing 300 l of superfluid helium at 1.6K has been tested at the industrial prime contractor MBB. Several new techniques for cold telescopes are used in GIRL, for instance a glass ceramics primary mirror, a low power chopping secondary and an active helium phase separator. (8 refs.)

64342 The Extreme Ultraviolet Explorer. S.Bowyer (Astron. Dept., Univ. of California, Berkeley, CA, USA).

Adv. Space Res. (GB), vol.2, no.4, p.157-65 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

The Extreme Ultraviolet Explorer (EUVE) Mission is described. The purpose of this mission is to search the celestial sphere for astronomical sources of extreme ultraviolet (EUV) radiation (100-1000 Å). The search will be accomplished with the use of three EUV telescopes, each sensitive to different bands within the EUV band. A fourth telescope will perform a high sensitivity search of a limited sample of the sky in a single EUV band. In six months, the entire sky will be scanned at a sensitivity level comparable to existing surveys in other more traditional astronomical bandpasses. A substantial number of EUV sources such as hot white dwarfs and stellar coronae are certain to be discovered given our current knowledge. More uncertain is what entirely new classes of objects will be discovered as EUV sources. A moderate resolution (~5 Å) spectroscopy option is being considered which would cover the band from 80 to 600 Å. (36 refs.)

64343 The ROSAT mission. J.Trumper (Max-Planck-Inst. für Phys. und Astrophys., Garching, Germany).

Adv. Space Res. (GB), vol.2, no.4, p.241-9 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

A primary scientific objective of the ROSAT mission is to perform the first all-sky survey with an imaging X-ray telescope leading to an improvement in sensitivity by several orders of magnitude compared with previous surveys. A large number of new sources ($\geq 10^4$) will be discovered and located with an accuracy of 1 arcmin or better. After completion of the survey which will take half a year the instrument will be used for detailed observations of selected sources with respect to spatial structure, spectra and time variability. In this mode which will be open for guest observers ROSAT will provide substantial improvement over the imaging instruments of the Einstein observatory. The main ROSAT telescope consists of a fourfold nested mirror system with 83 cm aperture having three focal plane instruments. Two of them will be imaging proportional counters (0.1-2 keV) providing a field of view of 2°, an angular resolution of $\approx 30''$ in the pointing mode and a spectral resolution $\Delta E/E \approx 45\%$ FWHM at 1 keV. The third focal instrument will be a high resolution imager (≈ 320). (15 refs.)

64344 AXAF, a permanent orbiting X-ray observatory: telescope and instrumentation plans. M.V.Zombeck (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).

Adv. Space Res. (GB), vol.2, no.4, p.259-70 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

The Advanced X-ray Astrophysics Facility (AXAF) now under study is to be a long-lived X-ray observatory in space. It is to be launched by the Space Shuttle, maintainable on-orbit, and retrievable for ground refurbishment. The AXAF is conceived as an X-ray telescope with 6 nested grazing incidence X-ray mirrors (with a maximum aperture of 1.2 m) and interchangeable and replaceable focal plane instruments. The optics will provide 0.5 arcsecond imagery over a several arcminute field and somewhat reduced resolution over 1 degree in the X-ray band from 0.1 to 10 keV (1.2 to 120 Å). The characteristics and expected performance of the observatory are described. (7 refs.)

64345 X-ray astronomy from the Space Shuttle. D.McCammon (Phys. Dept., Univ. of Wisconsin, Madison, WI, USA).

Adv. Space Res. (GB), vol.2, no.4, p.271-9 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

A wide variety of new X-ray instrumentation is being proposed to attack an even wider variety of astrophysical problems. It includes general-purpose instruments which, with further development and testing, may someday be part of the complement of an orbiting 'observatory' facility, such as AXAF. Other instruments promise significant and often necessary advantages for a narrower range of problems. The testing and development of all of these ideas, and in particular finding an efficient way to employ the latter class to make the observations for which they are intended, pose dilemmas for which the Space Shuttle potentially offers solutions. A discussion of possible modes for using the Shuttle and a brief sampling of new instrumentation ideas are presented. (18 refs.)

64346 Japanese satellite programs in X-ray astronomy. S.Miyamoto (Dept. of Phys., Osaka Univ., Osaka, Japan).

Adv. Space Res. (GB), vol.2, no.4, p.285-91 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

Future programs of X-ray astronomy in Japan are described. Following the Hakucho satellite, ASTRO-B and ASTRO-C are under preparation. ASTRO-B, to be launched in early 1983, is designed for the study of X-ray spectra and variability of X-ray sources. It is equipped with gas scintillation proportional counters of total area 1000 cm², one dimensional X-ray focusing collectors, transient source monitors and a gamma-ray burst monitor. ASTRO-C will be launched in 1987 to study the time variability of cosmic X-ray sources with high statistical accuracies. The main emphasis is placed not only on the accurate timing analysis of the galactic sources but on the investigation of the time variability of active galactic nuclei. This satellite will be equipped with large area, low background proportional counters of total area of about 5000 cm², an all sky monitor and a gamma-ray burst detector. (4 refs.)

64348 X-ray Timing Explorer. H.Bradt (Center for Space Res., Dept. of Phys., MIT, Cambridge, MA, USA).

Adv. Space Res. (GB), vol.2, no.4, p.315-21 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

The payload for the US X-ray Timing Explorer is currently being selected by NASA. Some of the possible instrumental capabilities and scientific objectives of the mission are described. (14 refs.)

64349 Photometric apparatus 'Duga' for investigating Polar auroras and tropical arcs from onboard the orbital station 'Salyut-6'. N.P.Petkov, M.M.Gogoshev, S.I.Sargoichev.

C.R. Acad. Bulg. Sci. (Bulgaria), vol.35, no.9, p.1229-32 (1982). In Russian.

A description and schematic circuit diagrams are given of an electrophotometric apparatus, designated 'Duga', and designed and constructed for installation on the Soviet orbiting space station, 'Salyut-6' as part of the equipment for investigation optical effects in the upper atmosphere such as the polar auroras and the tropical and equatorial arcs. The operation of the optical part of 'Duga' is based on the use of a double-filter method, whereby the spectral background around each emission line is measured by means of the change in the angle of inclination of the filter. In addition to determining the spectral characteristics of the observed atmospheric phenomena, the apparatus also enables their spatial coordinates to be recorded. Within the period May 1979 to Sept. 1980 the 'Duga' apparatus was used in about 30 sessions of observation, the results of which confirmed the validity of the observation method. (4 refs.) A.J.B.

64350 Spacecraft attitude sensing based on the Earth's radiation. L.Fraiture (European Space Operations Centre, Darmstadt, Germany).

ESA Bull. (France), no.33, p.29-36 (Feb. 1983).

Spacecraft payloads usually have to be oriented towards specific targets and in many cases very accurate attitude parameters must be calculated. The Earth itself constitutes an obvious inertial reference, and one means of determining the absolute orientation of the spacecraft's axes is to observe the Earth's radiation by means of optical sensors working at visible or, more frequently, infrared wavelengths. Some key albedo and infrared sensors used in ESRO/ESA spacecraft are surveyed pointing out that these sensors work successfully up to altitudes of 30000 km, and are considerably less complex than the alternative star sensors. (no refs.)

64351 Earth-return trajectory options for the 1985-86 Halley opportunity. R.W.Farquhar, D.W.Dunham (NASA Goddard Space Flight Center, Greenbelt, MD, USA).

J. Astronaut. Sci. (USA), vol.30, no.4, p.307-28 (Oct.-Dec. 1982). [received: March 1983]

A unique and useful family of ballistic trajectories to Halley's comet is described. The distinguishing feature of this family is that all of the trajectories return to the Earth's vicinity after the Halley intercept. It is shown that, in some cases, the original Earth-return path can be reshaped by Earth-swingby maneuvers to achieve additional small-body encounters. The Earth-return trajectory technique also provides an opportunity for a low-cost Halley sample-return mission. Dust and gas samples are collected during the high-velocity flythrough of Halley, and then returned to a high-apogee Earth orbit. Aerobraking maneuvers are used to bring the sample-return spacecraft to a low-altitude circular orbit where it can be recovered by the Space Shuttle. (16 refs.)

64352 Navigation system design for a Halley sample return mission. L.J.Wood, S.L.Craig, D.K.Yeomans, M.J.Bergam (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).

J. Astronaut. Sci. (USA), vol.30, no.4, p.329-46 (Oct.-Dec. 1982). [received: March 1983]

A ballistic sample return mission to Comet Halley was recently considered by the United States. The authors describe the navigation system and the navigation strategy which would have been employed in such a mission, assuming a launch in August of 1985, an arrival at the comet in March of 1986, and a return to Earth in August of 1989. Estimates of spacecraft comet- and Earth-relative orbit determination accuracies are presented as functions of time. Target-relative delivery accuracies for the spacecraft and associated trajectory correction maneuver requirements are presented also. (16 refs.)

64353 Position parameter estimation for slit-type scanning sensors. J.W.Fowler, E.G.Rolfé (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).

J. Astronaut. Sci. (USA), vol.30, no.4, p.385-402 (Oct.-Dec. 1982). [received: March 1983]

When a celestial source of electromagnetic radiation is detected by a slit-type scanning sensor, the position deduced for it will generally have an error whose statistical description is nongaussian. This must be taken into account in the formulation of an optimal estimation technique for these positions. The authors describe such a technique, including methods for deciding whether separate detections stem from a single common source and methods for combining multiple detections to obtain refined estimates of source positions. (8 refs.)

64354 Total current to cylindrical collectors in collisionless plasma flow. R.Godard, J.G.Laframboise (Phys. Dept., York Univ., Toronto, Canada). *Planet. & Space Sci. (GB)*, vol.31, no.3, p.275-83 (March 1983). A theory is presented for charged-particle collection by a cylindrical conducting object, such as a spacecraft or an electrostatic probe, which is moving transversely through a collisionless plasma, such as those in the upper atmosphere and space. The calculation is approximate, using symmetric potential profiles which are exact for the infinite-cylinder stationary case. Theoretical current predictions are presented for ratios of collector potential to electron thermal energy $e\phi_c/kT_e$ from 0 to -25, for ion-to-electron temperature ratios $T_i/T_e=1$ and 0.5, ratio of collector radius to electron Debye length r_c/λ_D from 0 to 100, and ratio of flow speed to ion thermal speed $S_i=U/(2kT_i/m_i)^{1/2}$ from 0 to 10. Comparisons with existing exact calculations by other authors show that none of these fulfil all of the requirements for nontrivial comparison. Appropriate parameter ranges for future exact calculations are thereby suggested. (31 refs.)

64355 Some geometric expressions for the observation by means of a spinning satellite. T.Kohno (Inst. of Phys. & Chem. Res., Saitama, Japan). *Rep. Inst. Phys. & Chem. Res. (Japan)*, vol.58, no.6, p.105-16 (1982). In Japanese.

Some spherical geometric expressions needed for the observation by means of a spinning satellite or a rocket are obtained. One needs the geometric relations between the field of view and the direction of the geomagnetic field or the location of the Earth for the observation of the radiations such as charged particles or X-rays. Further, in case of the observation of X-rays emitted from a local area of the Earth or the Earth's atmosphere, it is necessary to get the location of the point which corresponds to the line of sight in the field of view. In addition to their mathematical expressions, some calculated results for the scientific satellite 'HINOTORI' will be presented. (1 ref.)

64359 Theory for the motion of the four large planets. The solution TOP82. J.L.Simon (Bureau des Longitudes, CNRS, Paris, France).

Astron. & Astrophys. (Germany), vol.120, no.2, pt.2, p.197-202 (April 1983). The TOP82 solution is obtained from a theory of the four large planets which has been adjusted to the numerical integration DE200. The variables used are $a, \lambda, E, e, \omega, \Omega$. The theory includes the perturbations developed up to the third order of the masses for the four large planets. Perturbations up to the seventh order obtained by harmonic analysis, using an iterative process complete the theory for the couple Jupiter-Saturn. The comparison to an internal numerical integration over 1000 yr shows the accuracy obtained. The TOP82 solution is described and the perturbations of the four large planets by the inferior planets computed by Bretagnon (1982) and the relativistic perturbations expressed in isotropic and standard coordinates are presented. Adjustment to the numerical integration of the JPL DE200 (Standish, 1982) gives the constants of integration. The differences TOP82-DE200, over one century are given, for the four large planets, for the heliocentric longitude, the heliocentric latitude and the radius vector. Finally, the author gives the mean elements connected to the fixed J2000.0 ecliptic and the mean elements connected to the ecliptic of the date. (8 refs.)

64360 An empirical initial estimate for the solution of Kepler's equation. B.V.Sheela (Mission Operations & Planning Div., ISRO Satellite Centre, Bangalore, India). *J. Astronaut. Sci. (USA)*, vol.30, no.4, p.415-19 (Oct.-Dec. 1982). [received: March 1983]

An empirical formula is presented for an efficient initial estimate for the iterative solution of Kepler's equation. This formula is essentially a polynomial in eccentricity and mean anomaly whose coefficients have been obtained by minimizing the sum of the squared differences of the actual and calculated eccentric anomaly corresponding to a wide range of points in the $M-e$ plane. The efficiency in terms of the number of iterations for convergence is discussed along with comparisons with those of other starting formulas. (5 refs.)

95.30 FUNDAMENTAL ASPECTS OF ASTROPHYSICS

64361 Comptonization effects in spherical accretion onto black holes. J.R.Ipser (Dept. of Phys., Univ. of Florida, Gainesville, FL, USA), R.H.Price. *Astrophys. J. (USA)*, vol.267, no.1, pt.1, p.371-83 (1 April 1983).

For spherical accretion of gas onto a black hole, dissipative heating (from magnetic reconnection, dissipation of turbulence, etc.) leads at high accretion rates to densities and temperatures at which Comptonization unavoidably plays an important role, both in determining gas temperature and in forming the emergent spectrum. The authors find approximate descriptions of some observational features of such astrophysical objects with a simple, yet justifiable, Ansatz that evades the complexities of nonlocality. A very natural connection between the ratio of luminosity to Eddington luminosity and the hardness of X-ray spectra emerges, suggesting that the observed X-ray hardness ratios of luminous sources are a consequence of those sources being more or less Eddington limited. (23 refs.)

64362 Gravitational lens effects of neutrino astronomical objects. Xu Chongming, Wu Xuejun (Dept. of Phys., Fudan Univ., Shanghai, China). *Astron. & Astrophys. (Germany)*, vol.120, no.1, pt.1, p.15-20 (April 1983). Neutrino astronomical objects are discussed as transparent gravitational lenses. The trajectory of a light ray emitted from the source which is located either outside or inside the transparent isotropic astronomical object is obtained by means of the solution of the geodesic equations. (If the source tends to infinity, the trajectory corresponds to the ordinary deflection of light by the Sun.) Furthermore, the brightness amplification ratio K is derived from the redistribution of intensity due to the gravitational lens effects. The amplification K is computed in the metric of a star of uniform density. K can reach a value of five hundred under some conditions. Finally, it is suggested that some quasars may be the sources in neutrino astronomical objects. (29 refs.)

64363 Hydrogen at high pressures and temperatures. M.Robnik, W.Kundt (Inst. für Astrophys., Univ. Bonn, Bonn, Germany). *Astron. & Astrophys. (Germany)*, vol.120, no.2, pt.2, p.227-33 (April 1983). The authors assess the degree of ionization, and equation of state of hydrogen above the dissociation temperature $T_{\text{dis}}=4.47$ eV/k. A vapour-liquid-like phase transition is found below a (second) critical point at $(T_c, \rho_c)=(1.9 \cdot 10^4 \text{ K}, 2.4 \cdot 10^{11} \text{ dyn cm}^{-2})$. At the transition, the degree of ionization changes almost discontinuously. The low-density phase is almost non-degenerate whereas the high-density phase is almost completely degenerate, i.e. can be

identified with liquid metallic hydrogen. An updated phase diagram is presented. (25 refs.)

64364 An exact solution for an isothermal gas cloud with fast differential rotation. F.Schmitz (Inst. für Theoretische Astrophys., Univ. Heidelberg, Heidelberg, Germany). *Astron. & Astrophys. (Germany)*, vol.120, no.2, pt.2, p.234-6 (April 1983). Properties of an isothermal self-gravitating gas cloud with fast differential rotation, infinite extension, a flattened density distribution, and finite central density are discussed. It is described by a simple exact solution of the equations of structure of self-gravitating and rotating gaseous masses. These are transformed to a simple differential equation which seem appropriate for search of exact solutions. Further attempts to find other exact solutions are discussed. (11 refs.)

64365 Atomic calculations for Ca XVII; UV and X-ray lines. A.K.Bhatia, H.E.Mason (Lab. for Astron. & Solar Phys., Goddard Space Flight Center, NASA, Greenbelt, MD, USA). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.52, no.1, p.115-24 (April 1983). Energy levels, transition probabilities, collision strengths (distorted wave) are obtained for the configurations $2s^2$, $2s2p$, $2p^2$, $2s3s$, $2s3p$ and $2s3d$ and $2s3d$ configurations of Ca XVII. The theoretical intensity ratios for the UV and X-ray lines are compared with observed intensities in solar flare spectra. (19 refs.)

64366 Magnetohydrodynamic Universe corresponding to a Kantowski-Sachs metric. M.Bray. *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.4, p.221-4 (31 Jan. 1983). In French. Presents some exact solutions of the Einstein system for a MHD energy-momentum tensor generating a Kantowski-Sachs metric. (2 refs.)

64367 Accelerator simulation of astrophysical processes. T.A.Tombrello (W.K. Kellogg Radiation Lab., California Inst. of Technol., Pasadena, CA, USA). *IEEE Trans. Nucl. Sci. (USA)*, vol.ns-30, no.2, p.1169-72 (April 1983). (1982 IEEE Conference on the Application of Accelerators in Research and Industry, Denton, TX, USA, 8-10 Nov. 1982). The interaction of energetic ions with matter is responsible for many of the processes by which the elements were synthesized, energy is generated in stars, interstellar grains are destroyed, and molecules are created in space. All of these processes are amenable to simulation in the laboratory using accelerated ion beams, which allows a more comprehensive understanding of nature than one could obtain by observation alone. In addition, ion beam techniques are extremely useful in the determination of the elemental and isotopic abundances that arise from astrophysical nuclear synthesis. (20 refs.)

64368 Multiple transonic solutions with a new class of shock transitions in steady isothermal solar and stellar winds. S.R.Habbal, K.Tsinganos (Harvard-Smithsonian Center for Astrophysics, Cambridge, MA, USA). *J. Geophys. Res. (USA)*, vol.88, no.A3, p.1965-75 (1 March 1983). A new class of shock transitions are shown to arise in the transonic solutions of the steady isothermal solar wind equations when, for example, momentum deposition gives rise to multiple critical points in the flow. These shock transitions between critical solutions occur for a certain range of the parameters characterizing the momentum deposition function. In the presence of such shock transitions, the isothermal wind equations admit multiple transonic solutions, namely a continuous solution passing through an inner critical point and solutions involving a shock transition between critical solutions. These multiple transonic solutions have the same flow speed at the base but different supersonic flow speeds at infinity. The physical relevance of these properties for astrophysical systems such as the inner solar wind, extragalactic jet flows and accretion discs are discussed. (28 refs.)

64369 Electron-impact excitation of the Cameron system ($a^3\pi \rightarrow X^1\Sigma$) of CO. P.W.Erdman, E.C.Zipf (Dept. of Phys. & Astron., Univ. of Pittsburgh, Pittsburgh, PA, USA). *Planet. & Space Sci. (GB)*, vol.31, no.3, p.317-21 (March 1983). Studies the excitation of the Cameron bands of carbon monoxide ($a^3\pi \rightarrow X^1\Sigma$) by electron impact on CO and CO₂. This investigation was prompted by a recent study of the Martian airglow by Conway (1981) who concluded that the cross section for the dissociative excitation of the Cameron bands is seven times larger than the laboratory value reported by Ajello (1971a) and by a perplexing inconsistency between the optical cross section and CO($a^3\pi$) time-of-flight experiments. The present authors found that three factors have contributed to these discrepancies: (1) spectral contamination of the (1,4) Cameron band used by Ajello to normalize the entire Cameron band cross section, (2) major revisions in the magnitude of the CO($a^3\pi$) radiative lifetime, and (3) new insights into the effects of the CO($a^3\pi$) velocity distribution on the field of view of the emission experiments. The new results suggest that the calculated photoelectron fluxes in the Martian atmosphere may be too large by a factor of 3. (12 refs.)

64370 Is the local monopole flux enhanced? K.Freese, M.S.Turner (Astron. & Astrophysics Center, Univ. of Chicago, Chicago, IL, USA). *Phys. Lett. B (Netherlands)*, vol.123B, no.5, p.293-8 (7 April 1983). Dimopoulos et al. (1982) have suggested that a cloud of monopoles orbiting the Sun may significantly enhance the local monopole flux relative to the average flux in the Galaxy. The present authors have studied this scenario in detail and find that if the magnetic fields of strength $O(100 m_{16} \text{ kG})$ exist inside the Sun, then monopoles passing through the Sun can be captured into orbit, leading to a local enhancement of at most $O(50 m_{16}^2)$ (monopole mass = $m_{16} 10^{16} \text{ GeV}$). Monopoles of mass 10^{16} GeV can also be captured into orbit by passing through Jupiter, this leads to a local enhancement of $O(1.1-3)$. (12 refs.)

64371 Active plasmas near planets and stars. K.Schindler (Ruhr-Univ. Bochum, Bochum, Germany). *Phys. Scr. (Sweden)*, vol.T2, no.1, p.163-8 (1982). (1982 International Conference on Plasma Physics, Göteborg, Sweden, 9-15 June 1982). There are many processes in nature that correspond to the following scheme. During a passive quasi-stationary time-variation suddenly critical conditions are reached, which lead to the onset of an active dynamic phase. Here the terms 'passive' and 'active' indicate whether or not the process is predominantly driven by external variations. Typically, free energy is slowly accumulated during the passive phase and is rapidly released during activity. The point of onset of the active phase can usually be associated with some kind of instability or nonequilibrium condition. There is increasing evidence indicating that prominent space and astrophysics processes belong to this general class of phenomena. The author discusses relevant aspects of two major examples of such phenomena that belong to the Solar System, i.e. geomagnetic and solar activity. (36 refs.)

64372 Recent topics in physics of hot plasmas in space environment. A.Hasegawa (Bell Labs., Murray Hill, NJ, USA). *Phys. Scr. (Sweden)*, vol.T2, no.1, p.223-7 (1982). (1982 International Conference on Plasma Physics, Göteborg, Sweden, 9-15 June 1982). A brief review is presented on the subject of recent interest in physics of hot plasmas in space environment. The subjects chosen are the double layer, the reconnection of magnetic line of force, and Jupiter's magnetosphere. (34 refs.)

64373 A review of double layer simulations. R.A.Smith (Sci. Applications Inc., McLean, VA, USA). *Phys. Scr. (Sweden)*, vol.T2, no.1, p.238-51 (1982). (1982 International Conference on Plasma Physics, Göteborg, Sweden, 9-15 June 1982). A critical review of numerical simulations of plasma double layers is presented. Physical aspects of the double-layer problem are discussed, together with numerical methods appropriate to treat them. Particular emphasis is given to examining boundary conditions and their effect on the physical dynamics. Some physical processes currently thought to be important for double layers are discussed, and the simulation results are described with particular emphasis on their relation to these concepts. The review concludes with an interpretive discussion of the results, together with comments on their applicability to laboratory situations and to double layers in space. (60 refs.)

64374 A stationary free boundary problem for a circular flow with or without surface tension. H.Okamoto (Dept. of Maths., Univ. of Tokyo, Japan). *Proc. Jpn. Acad. Ser. A (Japan)*, vol.58, no.10, p.422-4 (Dec. 1982). The author considers a free boundary problem which is a model for a flow round a planet. The flow is hence circular, and the fluid is taken as perfect and irrotational. (3 refs.)

64375 Ion implantation phenomena in space. J.-P.Bibring, F.Rocard (Lab. Rene Bernas, CSNSM, Orsay, France). *Radiat. Eff. (GB)*, vol.65, no.1-4, p.159-65 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981). Particle-grain interactions at implantation energies occur in a large variety of astrophysical sites. The expected physical, chemical and isotopic effects are discussed, as deduced from the analyses of (i) lunar grains implanted with the solar wind ions, and (ii) terrestrial grains implanted in the lab with H, C, N, ..., ions. Special emphasis is placed on the amorphisation and the erosion of the grains, and on the synthesis of radicals and molecules within the implanted grains. Implications in planetology and astrophysics are presented. (21 refs.)

- 64376 Experience of studying the spherical and chromatic aberrations of the double wide-angle 400/2000 astrophot. S.P.Major, G.A.Ivanov, A.N.Kanivets.

Astrometriya & Astrofiz. (USSR), no.47, p.84-7 (1982). In Russian.
 Optical properties of the double wide-angle astrophot are studied. The Hartmann criterion and the colour curves of the objectives are obtained. The test plates were taken with 6 narrow-band interference filters, with 3 colour glass filters and without a filter. Two kinds of screen, namely, the Hartmann diaphragm and a screen with two splits were used. In addition to the Hartmann test the Hertzprung method was involved to study the colour curves. This purpose an objective grating with 1.67 mm diameter grating bars and with a 0.33 mm space between the bars was used. (5 refs.)

- 64377 Field errors of the photometric system of the double long-focus astrophot of the Main Astronomical Observatory the Ukrainian SSR Academy of Sciences. G.A.Ivanov.

Astrometriya & Astrofiz. (USSR), no.47, p.87-90 (1982). In Russian.
 Describes methods for determining the field error and the colour system of the double long-focus astrophot. The central part of the field with diameter 40'-50' can be used for photographic photometry. (2 refs.)

- 64378 The photometric field error of the double wide-angle astrophot of the Main Astronomical Observatory of the Ukrainian SSR Academy of Sciences. N.G.Guseva, L.N.Kolesnik, N.F.Levina.

Astrometriya & Astrofiz. (USSR), no.47, p.99-101 (1982). In Russian.
 The photometric field error has been determined for the Zeiss double wide-angle astrophot of the Golosevsky Observatory ($D=400$ mm, $F=2000$ mm). The results indicate that the field error is symmetrical with respect to the plate centre. A field of about 1.5° (5 cm) radius is free from errors. The photometric field correction depends on the photographic density E of stellar images and is the smallest for $E=0.1-0.5$. (5 refs.)

- 64379 How to achieve diffraction limited resolution with large space telescopes. F.Rodder (Univ. of Nice, Nice, France).
Adv. Space Res. (GB), vol.2, no.4, p.3-9 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

Large space telescopes cannot be made diffraction-limited at least for short wavelengths. Methods for reconstructing diffraction-limited images are reviewed including active optics, Michelson stellar interferometry, non-redundant aperture arrays, deconvolution and shearing interferometry. Expressions are given for the signal-to-noise ratio in each case and the results of laboratory simulations are presented. (14 refs.)

- 64380 FLUTE or TRIO: different approaches to optical arrays in space. A.Labeyrie (CERGA, Saint Vallier de Thiey, France), E.Savaria, G.Schumacher.

Adv. Space Res. (GB), vol.2, no.4, p.11-22 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

FLUTE and TRIO are two versions of a proposed optical interferometer, intended as a first step towards large optical arrays. The two apertures of FLUTE are linked by solid members, while TRIO relies totally upon active stabilization techniques to maintain optical coherence with three satellites serving as array components. The feasibility of utilizing solar radiation pressure for fine control is studied. A natural and periodic variation of baseline spacing can be achieved by certain orbital configurations. (10 refs.)

- 64381 Solar radiometry: spectral irradiance measurements. G.E.Brueckner (E.O. Hulburt Center for Space Res., Naval Res. Lab., Washington, DC, USA).

Adv. Space Res. (GB), vol.2, no.4, p.177-83 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

The present measurement accuracy of the solar spectral irradiance is insufficient to derive the real long-term solar spectral irradiance variability at all wavelengths. Possible error sources are discussed. A series of new second generation solar irradiance photometers are now under construction which should considerably improve these measurements. At the same time, efforts are made to improve the absolute UV calibration methods to derive a unified UV radiation scale. (7 refs.)

- 64382 Solar radiometry: total irradiance measurements. C.Frohlich (Phys. Meteorologisches Obs., World Radiation Center, Davos, Switzerland).
Adv. Space Res. (GB), vol.2, no.4, p.191-8 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

The operating principles of modern absolute radiometers are discussed and the methods of their characterization, that is the accurate determination of the uncertainties, are described. In view of this analysis, the results of the solar constant determinations of the last 6 years are reviewed and an estimate of their uncertainties given. Procedures for the strategy of future experiments are recommended. (21 refs.)

- 64383 X-ray imaging techniques—modulation collimator and coded mask. M.Oda (Inst. of Space & Astronaut. Sci., Tokyo, Japan).

Adv. Space Res. (GB), vol.2, no.4, p.207-16 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

Imaging over the hard X-ray energy band may be achieved by masking the flux with proper obstacles. The imaging modulation collimator has been developed and has been applied thus far, e.g. to produce hard X-ray pictures of the solar flare and to construct the X-ray image of the Crab Nebula up to the angular resolution of ~ 10 arcsec. Variations of the concept such as the Fourier Transform Telescope are discussed. Virtue of the modulation collimator is that high angular resolution may be achieved with a relatively simple detector system and that a wide field of view may be accommodated. Among several proposed coded masks, the techniques of Hadamard transform are discussed in some details. (15 refs.)

- 64384 The Pinhole/Occulter Facility. H.S.Hudson (Center for Astrophys. & Space Sci., Univ. of California, San Diego, CA, USA).

Adv. Space Res. (GB), vol.2, no.4, p.307-14 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).

The Pinhole/Occulter Facility concept uses a remote occulting mask to provide high resolution observations of the solar corona and of astronomical X-ray sources. With coded-aperture and Fourier-transform techniques, the Pinhole/Occulter makes images at a resolution of 0.2 arc sec for 2-120 keV X-rays, using a 50-m boom erected from the payload bay of the Space Shuttle or mounted on a free-flying platform. The remote occulter also creates a large shadow area for solar coronal observations; the Pinhole/Occulter concept includes separate optical and ultraviolet telescopes with 50-cm apertures. These large telescopes will provide a new order of resolution and sensitivity for diagnostic observations of faint structures in the solar corona. The Pinhole-Occulter is a powerful and versatile tool for general-purpose X-ray astronomy. The large collecting area of 1.5 m² results in a 5 σ detection threshold of about 0.02 μ Jy for the 2-10 keV band, or about 10⁻⁵ ph/(cm²sec keV)⁻¹ at 20 keV. (20 refs.)

- 64385 Flight-time system with automatic adjustment and logic sampling of information for the Nataliya-2 telescope. D.Yu.Akimov, S.E.Belenko, Yu.D.Kotov, O.N.Romanov, V.T.Samoilenko (Inst. of Engng. Phys., Moscow, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.4, pt.1, p.828-32 (July-Aug. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.4, p.45-9 (July-Aug. 1982). [received: April 1983]

Describes a flight-time system designated for operation in a γ -telescope; the system is characterized by automatic adjustment and logic sampling of information. The counters comprise a scintillator, lightguides, FEU-85 photomultipliers and amplifiers. The basic characteristics of the system are: flight base, 40 cm; size of the sensitive detector region, 240×240×5 mm; and suppression of the background resulting from particles moving in the opposite direction, 100-200 fold at a recording efficiency in excess of 90% for useful events. Power consumption is about 8 W. The characteristics are preserved in a wide temperature range and when the supply voltages change, owing to automatic adjustment of the delays of signal propagation in the measuring channels. (16 refs.)

95.65 AUXILIARY AND RECORDING INSTRUMENTS

- 64386 Gamma-ray imaging with a rotating modulator. P.Durouchoux (CENS, CEA, Gir-sur-Yvette, France), H.Hudson, G.Hurford, K.Hurley, J.Matteson, E.Orsal.

Astron. & Astrophys. (Germany), vol.120, no.1, pt.1, p.150-5 (April 1983).

A γ -ray imaging system, called a rotating modulator, is described, which allows a large area of the sky (radius $\approx 27^\circ$) to be imaged with a limiting resolution of $\leq 1^\circ$ for intense sources. It operates in the 30 keV-10 MeV energy range, and does not rely on position sensitive detection devices. It possesses a multiplex advantage which allows sky surveys to be completed in a small fraction of the time needed by a conventional collimation system. In addition, it is relatively insensitive to background fluctuations, which makes it ideally suited to satellite applications. The concept is illustrated by the results from a study of a γ -ray spectroscopy experiment. (11 refs.)

- 64387 Superconducting bolometers for IR astronomical techniques. II. Noise limitations. V.P.Kuz'kov.

Astrometriya & Astrofiz. (USSR), no.47, p.95-8 (1982). In Russian.

For pt.1 see ibid., no.42, p.90-6 (1980). Methods of decreasing the noise in superconducting bolometers and ways of increasing their detectivity are analyzed. Problems concerning the effect of the bolometer on the noise of a photodetection device are considered. A scheme is proposed to stabilize the bolometer in order to provide long integration times. (5 refs.)

Astrometriya & Astrofiz. (USSR), no.48, p.89-94 (1983). In Russian.

An automatic device for measuring photographs of the limb of a graduated circle is designed on the basis of a laser interferometer. The random error of the measurement of distances between the divisions of the circle and the index is $\pm 0.14 \mu\text{m}$ ($\pm 0.01''$). The systematic error does not exceed $\pm 0.2 \mu\text{m}$. (11 refs.)

95.70 OTHER INSTRUMENTATION AND TECHNIQUES

(inc. clocks, frequency standards)

- 64390 Atomic clocks for astrophysical measurements.** R.F.C.Vessot, E.M.Mattison (Harvard-Smithsonian Center for Astrophysics, Cambridge, MA, USA). *Adv. Space Res. (GB)*, vol.2, no.4, p.23-31 (1982). (Proceedings of Symposium 4 of the COSPAR Twenty-Fourth Plenary Meeting, Ottawa, Canada, 16 May-2 June 1982).
- Recently developed atomic hydrogen masers have achieved stability well into the 10^{-16} domain for averaging time intervals beyond 1000 sec and future devices promise further improvements. Proposed space missions using these clocks are discussed for the measurement of the Sun's gravity field distribution and tests of gravitation and relativity including a search for pulsed low frequency (~ 0.001 Hz) gravitational waves, and orbiting VLBI stations. Estimates of system performance capability, are discussed and the accuracy capability of relativistic measurements evaluated. (12 refs.)
- 64391 Laboratory simulation of photometric light curves of the asteroids.** M.A.Barucci, R.Casaccia, M.Fulchignoni (Istituto di Astrofisica Spaziale, CNR, Frascati, Italy), R.Burchi, A.Dipaolantonio, C.Giuliani, L.Milano, F.Scaltriti, V.Zappala. *Moon & Planets (Netherlands)*, vol.27, no.4, p.387-95 (Dec. 1982).
- Reports laboratory simulations of asteroid observations obtained using a specially designed apparatus SAM (the acronym stands for System for Asteroid Models). The aim of the experiment is to assess the geometrical and physical characteristics of an asteroidal body which may affect the shape of its light curve; and, in particular, the parameters which define asteroid orientation with respect to the observer, and the shape and surface morphology of the asteroids. The design and operation of the SAM are described in some detail and the first results obtained with models having a regular shape are presented and discussed. (8 refs.)
- ASA 1000 and color too See Entry 64399

95.75 TECHNIQUES OF OBSERVATION AND REDUCTION

- 64392 Infrared speckle imaging: improvement of the method; results on Miras and protostars.** J.M.Mariotti (Istituto di Fisica Cosmica, Milano, Italy), A.Chelli, R.Foy, P.Lena, F.Sibille, G.Tchountonov. *Astron. & Astrophys. (Germany)*, vol.120, no.2, pt.2, p.237-48 (April 1983).
- After the first results obtained in 1978 and 1979, a new infrared speckle-interferometer has been built at Lyon Observatory and successfully tested during three observation runs. Improved methods of data reduction, including selection of true diffraction limited images, are presented here. Suggestions for further improvements are also done. 19 spatial spectra have been obtained for 11 sources, some of them being observed with several Position Angles and/or wavelengths. Three extremely interesting objects are discussed in detail: (a) IRC+10216 for which the ellipticity is derived at $\lambda=4.6 \mu\text{m}$. (b) The protostellar candidate GL 2591, which is marginally resolved at $4.6 \mu\text{m}$, and whose angular size is too small to account for the total luminosity of the associated molecular cloud. (c) MWC 349 for which the authors derive an upper limit, supporting the pre-planetary disk model proposed for this source. (55 refs.)
- 64393 A generalized algorithm for efficient photometric reductions.** J.Manfroid (Dept. d'Astrophys., Univ. de Liege, Cointe-Ougree, Belgium), A.Heck. *Astron. & Astrophys. (Germany)*, vol.120, no.2, pt.2, p.302-6 (April 1983).
- The authors present a generalized method applicable to the reduction of photometric observations in any well-defined system. The method is characterized by the use of practically every measurement of any non-variable star in the reduction procedure. Its main advantages are a greater accuracy and a substantial saving of observing time on extinction and standard stars. A particular case of application to the *uvby* system is detailed and discussed in an appendix. (19 refs.)
- 64394 The influence of ionospheric refraction on radio astronomy interferometry.** T.A.T.Spoelstra (Netherlands Found. for Radio Astron., Dwingelo, Netherlands). *Astron. & Astrophys. (Germany)*, vol.120, no.2, pt.2, p.313-21 (April 1983).
- A correction procedure for ionospheric refraction in radio astronomy interferometry is outlined. This correction is applied to observations made with the Westerbork Synthesis Radio Telescope and its results are discussed. It turns out that a correction for a combination of both horizontal and vertical gradients in the electron density distribution can improve the observations considerably. It is shown that this approach gives better results than would be derived by taking into account the horizontal structure of the ionosphere only. The available ionosphere data based on ionosonde observations limit the applications significantly. At present the correction can only be determined each full hour. Furthermore, since the information about the ionosphere is determined from ionosonde data it is not possible to derive reliable corrections around sunrise, when rapid changes in the vertical electron density distribution occur. (20 refs.)
- 64395 Determination of microturbulent velocity using Fraunhofer lines of Fe I.** V.A.Shemina. *Astrometriya & Astrofiz. (USSR)*, no.47, p.41-8 (1982). In Russian.
- Develops and applies a new method for determining microturbulent velocities in the solar photosphere. The method is based on different responses of equivalent widths and central depths of the Fraunhofer lines to variations in microturbulent velocity. The results of photometric microturbulent velocity determinations by various methods are described. (43 refs.)

- 64396 On the use of the false perturbation method in astronomical practice.** S.V.Pasechnik, V.V.Telnyuk-Adamchuk, A.N.Shaido. *Astrometriya & Astrofiz. (USSR)*, no.48, p.85-8 (1983). In Russian.
- The false perturbation method is discussed as applied to solution of ill-conditioned systems of linear equations. The conditionality number is shown not to be criterion for application of the method. Different procedures for determining the real eigenvalues of the normal equation matrix and a general scheme for solving the ill-conditioned equation system are suggested. (22 refs.)
- 64397 Japan-US joint VLBI experiment.** N.Kawajiri (Radio Res. Labs., Ministry of Posts & Telecommunications, Ibaraki, Japan). *J. Inst. Electron. & Commun. Eng. Jpn. (Japan)*, vol.65, no.10, p.1046-9 (Oct. 1982). In Japanese. [received: March 1983] (11 refs.)
- 64398 A posteriori spatial filtering of a short-exposure image distorted by the atmosphere.** P.A.Bakut, K.N.Sviridov, V.N.Sidelnikov, N.D.Ustinov. *Opt. & Spectrosc. (USA)*, vol.53, no.1, p.96-7 (July 1982). Translation of: *Opt. & Spektrosk. (USSR)*, vol.53, no.1, p.163-6 (July 1982). [received: April 1983]
- Proposes an approach for reconstructing the modulus and phase of the optical transfer function (OTF) $H(\omega)$ of the atmosphere-telescope system [and, consequently, of the impulse response $h(s)$ of the system] by means of statistical processing of the spatial spectra of fragments of the recorded image and by using an iteration procedure for reconstruction. (2 refs.)
- 64399 ASA 1000 and color too.** D.Dicico. *Sky & Telesc. (USA)*, vol.65, no.3, p.215-17 (March 1983).
- The author reports astronomical tests of the new Kodacolor VR 1000 35-mm colour film. Photographs of the Orion Nebula, the Pleiades, and star trails between Polaris and Cassiopeia are described. (no refs.)
- 64400 Automatic Sun observations. II. Methods of observations.** N.A.Topchilo. *Vestn. Leningr. Univ. Ser. Mat. Mekh. & Astron. (USSR)*, no.1, p.99-110 (Jan. 1983). In Russian.
- The Sun observation methods realized on the basis of computer programs worked out for RT-22 automation are presented. Their precision, advantages and defects are described. Some problems which can be solved by means of new methods are also outlined. (3 refs.)

96.00 SOLAR SYSTEM

96.10 GENERAL, SOLAR NEBULA, AND COSMOGONY

- 64402 On the effect of systematic errors of proper stellar motion on determination of solar motion parameters. S.P.Rybka, A.I.Vatsenko. *Astrometriya & Astrofiz. (USSR)*, no.48, p.53-8 (1983). In Russian. Solar motion parameters obtained from Pulkova, Tashkent and AGK3 proper stellar motions are analyzed. The systematic errors of proper stellar motions in these catalogues resulted from differences of the estimations of solar motion parameters. (8 refs.)
 64403 The mass-independent fractionation of oxygen: a novel isotope effect and its possible cosmochemical implications. M.H.Thiemens, J.E.Heidenreich, III (Univ. of California, San Diego, La Jolla, CA, USA). *Science (USA)*, vol.219, no.4588, p.1073-5 (4 March 1983). Experimental evidence is presented which demonstrates a chemically produced, mass-independent isotopic fractionation of oxygen. The effect is thought to result from self-shielding by the major isotopic species $^{16}\text{O}_2$, but other possible mechanisms such as molecular symmetry cannot be ruled out. In a three-isotope plot, the experimentally produced fractionation line is essentially equal in slope to the observed carbonaceous chondrite mixing line. The implications for the early history of the solar system are discussed. (19 refs.)

96.20 MOON

- 64404 Variance and correlations of errors of rectangular coordinates for the selenodetic reference points. I.V.Gavrilov, A.S.Duma. *Astrometriya & Astrofiz. (USSR)*, no.48, p.64-71 (1983). In Russian. Variance and correlations of errors of the rectangular coordinates of 32 selenodetic reference points from the Consolidated catalogue is computed and analyzed. There is practically no correlation between the errors of the heteronymous coordinates of the considered point. The correlation between the homonymous coordinates of different points is either small or poorly determined. (4 refs.)
 64405 Accuracy of the outer orientation in the selenodetic coordinate system. V.S.Kislyuk. *Astrometriya & Astrofiz. (USSR)*, no.48, p.71-8 (1983). In Russian. Two sets of elements are considered for describing the absolute orientation of the selenodetic coordinate system. Errors of the Moon rotation parameters are analyzed as those affecting the accuracy of the absolute orientation of the quasi-dynamic coordinate system, the third axis of which is connected with the mean direction to the Earth. (17 refs.)

64406 Determination of the orientation angles of the selenodetic coordinate system based on the photographic positional observations of the Moon. V.S.Kislyuk, N.A.Vasilenko, R.L.Semerenco, V.B.Kollyuk. *Astrometriya & Astrofiz.* (USSR), no.48, p.78-84 (1983). In Russian. The photographic observations of the Moon against a stellar background were used for determining the orientation of the selenodetic coordinate system which is realized by the Consolidated Catalogue of 4900 basic points on the lunar surface with respect to the selenodetic coordinate system, the third axis of which is connected with the mean direction to the Earth. (13 refs.)

64407 The evolution of the Moon: a finite element approach. S.Chacko (Dept. of Geology, Rice Univ., Houston, TX, USA), J.C.De Brumaecker. *Moon & Planets* (Netherlands), vol.27, no.4, p.467-92 (Dec. 1982). Thermal convection has considerable influence on the thermal evolution of terrestrial planets. Previous numerical models of planetary convection have solved the system of partial differential equations by finite difference methods, or have approximated it by parameterized methods. The authors have evaluated the applicability of a finite element solution of these equations. The model analyses the thermal history of a self-gravitating spherical planetary body; it includes the effects of viscous dissipation, internal melting, adiabatic gradient, core formation, variable viscosity, decay of radioactive nucleides, and a depth dependent initial temperature profile. Reflecting current interest, physical parameters corresponding to the Moon were selected for the model. (41 refs.)

96.30 PLANETS AND SATELLITES

(exc. the Moon; for celestial mechanics, see 95.10; for Earth as an astronomical body, see 91. Geophysics)

64408 A comparison of volcanic eruption processes on Earth, Moon, Mars, Io and Venus. L.Wilson, J.W.Head, III (Dept. of Geological Sci., Brown Univ., Providence, RI, USA). *Nature* (GB), vol.302, no.5910, p.663-9 (21 April 1983).

The silicate planets and satellites display a wide range of physical, chemical and atmospheric characteristics which may influence the nature of volcanism, a major geological process common to the evolution of the surfaces of these bodies. Consideration of the process of magma ascent and eruption from first principles allows predictions to be made concerning volcanic eruption styles and expected landforms and deposits on each planetary body. Examination of actual landforms and deposits in the light of these predictions leads to a better understanding of the nature of volcanic eruption processes and outlines outstanding problems. (113 refs.)

64409 Solar System sputtering. T.A.Tombrello (W.K. Kellogg Radiation Lab., California Inst. of Technol., Pasadena, CA, USA). *Radiat. Eff.* (GB), vol.65, no.1-4, p.149-58 (1982). (Proceedings of the First International Conference on 'Radiation Effects in Insulators', Arco, Largo di Garda, Italy, 1981).

The solar wind and energetic magnetospheric ions are important agents for modification of the planetary surfaces and atmospheres with which they interact. Knowledge of the details of the sputtering mechanisms involved in these interactions can help in determining the interrelation of a number of planetary processes. The author discusses several sites in the Solar System where sputtering phenomena are significant. The quantitative understanding of these examples could be extended if one had a more detailed picture of the sputtering of insulators. Recent experimental results that bear on these problems as well as the gaps in the knowledge that prevent further progress will be presented. (52 refs.)

Hydrogen at high pressures and temperaturesSee Entry 64363

96.30E Venus

64410 A navigation model for the Venusian atmosphere. P.W.Birkeland, B.G.Williams, A.S.Konopliv (Jet Propulsion Lab., Pasadena, CA, USA). *J. Astronaut. Sci.* (USA), vol.30, no.4, p.367-83 (Oct.-Dec. 1982). [Received: March 1983]

A static, exponential atmosphere model for Venus is developed using period change data from the Pioneer Venus spacecraft. The model is derived from approximately 600 passages of the spacecraft through the upper Venusian atmosphere, or almost three full circulations of the planet. The model reflects several important, known atmospheric features (diurnal bulge, layering, etc.) and confirms several observations of a more sophisticated analysis. Several new phenomena are observed. (4 refs.)

64411 Comparison of measurements of electromagnetic induction in the magnetosphere of Venus with laboratory simulations. I.M.Podgorny, E.M.Dubinin, P.L.Israelevich (Space Res. Inst., Acad. of Sci., Moscow, USSR), C.P.Sonett. *Moon & Planets* (Netherlands), vol.27, no.4, p.397-406 (Dec. 1982).

Analysis of Venera 9 and 10 data suggest a comingled excitation of the ionosphere of Venus by the time dependent component of the interplanetary magnetic field, upon which may be superimposed a contribution from the interplanetary electric field. The inductive contributions correspond respectively to generation of eddy currents and to unipolar induction. The former is suggested when the interplanetary magnetic field exhibits significant changes in intensity or orientation, but could also have contributions from fluctuations in plasma pressure expressed through the frozen-in field. The magnetic field measured near Venus by Venera 9 and 10 is considered within this framework and with respect to laboratory simulation using both conducting and insulated spheres. (27 refs.)

A comparison of volcanic eruption processes on Earth, Moon, Mars, Io and VenusSee Entry 64408

96.30G Mars

64412 Exploring the Martian arctic. D.C.Parker, C.F.Capen, J.D.Beish. *Sky & Telesc.* (USA), vol.65, no.3, p.218-20 (March 1983).

The authors describe measurements of the retreat of the Martian north polar cap during 1979 and 1980, and during 1981 and 1982. During both apparitions the polar cap retreated more quickly than at previous oppositions, and the cap that remained at the beginning of the Martian summer was unusually small. In particular the dark feature Rima Tenuis re-appeared in 1980 and 1982 for the first time since 1903. These observations suggest that the Martian climate varies on a time scale of decades, and that the two most recent northern summers have been unusually warm. A possible correlation between the climates of Mars and the Earth is discussed briefly. (no refs.)

96.30H Asteroids

64413 Structure of asteroids expected from impact experiments. A.Fujiwara. *Astron. Her.* (Japan), vol.75, no.11, p.300-4 (1982). In Japanese.

Discusses methods of firing high velocity bullets up to 10 km/s, impact destruction, velocities of single particles and self-rotation, the Hirayama families of asteroids and collisions between parent bodies. (no refs.)

64414 Statistical study of asteroids. K.Ishida, T.Mikami. *Astron. Her.* (Japan), vol.75, no.11, p.305-10 (1982). In Japanese.

Considers the number and distribution of asteroids in the Solar System. The results of the McDonald and Palomar-Leiden photographic surveys are analyzed and the distributions of asteroid orbital parameters, magnitudes, albedos, and diameters are discussed. (no refs.)

64415 Rotation properties of the high-numbered asteroids 1236 Thais and 1317 Silvetta. H.J.Schober (Inst. fur Astron., Graz, Austria), A.Schroll. *Astron. & Astrophys.* (Germany), vol.120, no.1, pt.1, p.106-8 (April 1983).

1236 Thais and 1317 Silvetta were observed photoelectrically in *UBV*, each during three nights in September 1980, using the 0.6 m Bochum telescope during ESO-time, at the European Southern Observatory, La Silla, Chile. For 1317 Silvetta a 7 h rotation period and a lightcurve amplitude of 0.40^m with primary and secondary extrema were observed. For 1236 Thais an increase in brightness was detected during three consecutive nights with $\Delta V = 0.08^m$, indicating that 1236 Thais might be a slowly spinning asteroid with a very long rotation period. For both asteroids *UBV*-colors were measured and no significant variation found. (6 refs.)

64416 Physical studies of asteroids. X. Photoelectric light curves of the asteroids 219 and 512. C.-I.Lagerkvist, L.Kamel (Astron. Observatoriet, Uppsala, Sweden).

Moon & Planets (Netherlands), vol.27, no.4, p.463-6 (Dec. 1982).

For pt.IX see ibid., vol.27, no.1, p.107-10 (1982). Composite light curves are presented for the asteroids 219 Thunelda and 512 Tarimensis. Rotation periods of 1.24^h and 0.2326^h are derived for the two asteroids, respectively. *UBV*-colours are presented for the asteroids 147, 219, 317, and 512. (5 refs.)

Laboratory simulation of photometric light curves of the asteroidsSee Entry 64391

96.30K Jupiter

64417 The problem of cooling the cold Io torus. J.D.Richardson, G.L.Siscoe (Dept. of Atmospheric Sci., Univ. of California, Los Angeles, CA, USA).

J. Geophys. Res. (USA), vol.88, no.A3, p.2001-9 (1 March 1983). The transport of ions inward from Io's orbit is first modeled on the assumption that radial diffusion is the dominant transport mechanism and then modeled with a combination of diffusive and convective transport. Included in the model are thermal as well as number density transport, radiation, ionization and pickup of local neutrals, recombination, charge exchange, and Coulomb interactions. Pure diffusive transport is capable of accounting for the dramatic inward depletion of the torus only by invoking recombination or by postulating a massive increase in the production rate of torus ions sometime prior to Voyager encounter. It is shown that radical time dependence cannot account simultaneously for the density and temperature observations. Similarly, recombination is found to be much too slow to be the cause of the observed density decrease inside of Io. The model combining convection and diffusion can reasonably match the data, but only with a diffusion coefficient 100 times less than that derived from Pioneer observations. (40 refs.)

64418 A theory of the Io phase asymmetry of the Jovian decametric radiation. K.Hashimoto, M.L.Goldstein (Lab. for Extraterrestrial Phys., NASA Goddard Space Flight Center, Greenbelt, MD, USA).

J. Geophys. Res. (USA), vol.88, no.A3, p.2010-20 (1 March 1983).

Proposes an explanation of an asymmetry in the occurrence probability of the Io-dependent Jovian decametric radiation. This asymmetry is found to arise because when Io is in the northern part of the torus, more intense Alfvén waves are generated propagating southward than northward. These waves then cause the excitation of decametric radiation in the northern ionosphere after reflection from the southern ionosphere. The asymmetry then results from the propagation time of the Alfvén wave and the bending of the magnetic field (Alfvén wing) along this trajectory. The ray paths of the decametric radiation are calculated using a three-dimensional ray-tracing program in the Jovian ionosphere. (42 refs.)

64419 A second order Jupiter-Saturn planetary theory. I. O.M.Kamel (Astron. Dept., Faculty of Sci., Cairo Univ., Giza, Egypt), A.A.Bakry.

Moon & Planets (Netherlands), vol.27, no.4, p.417-30 (Dec. 1982).

Presents a second order secular Jupiter-Saturn planetary theory through Poincaré canonical variables, von Zeipel's method and Jacobi-Radau referential. The authors neglect in the expansions terms of power higher than the fourth with respect to eccentricities and sines of inclinations. The authors assume that the disturbing function is composed of secular and critical terms only. (19 refs.)

96.30M Saturn

64420 Electrophotometry of Saturn. I. Brightness distribution along equatorial regions in the 0.346-0.595 μ m spectral interval. A.P.Vid'machenko. *Astrometriya & Astrofiz.* (USSR), no.47, p.70-5 (1982). In Russian.

Photoelectric scans of Saturn's equatorial region are given for the 0.346-0.595 μ m spectral interval. The data were obtained at Majdanak Mountain on February 16, 1980 at the time of ring disappearance. The obtained brightness distributions are in good agreement with those for 1966. The limb brightness

increases with a decrease in wavelength and becomes brighter than the central region at $\lambda \leq 0.372 \mu\text{m}$. (12 refs.)

64421 Saturn. R.Suggs, R.Beebe.

I.A.U. Circ. (USA), no.3789, 1 pp. (7 April 1983).

The authors report the discovery on 1983 March 28 of a bright white cloud in Saturn's northern hemisphere. The cloud is at a planetographic latitude of $+38^\circ \pm 2^\circ$, and its west end was $10^\circ \pm 2^\circ$ east of Saturn's central meridian on March 29^h10^m36^s UT. The rotation period of Saturn at this latitude is 10^h41^m. This cloud is probably similar to the convective feature observed by the Voyager spacecraft at the same latitude and described by Smith et al. (1982). (1 ref.)

64422 Equatorial confinement of thermal plasma near the rings of Saturn.

W.-H.Ip (Max-Planck-Inst. für Aeronomie, Katlenburg-Lindau, Germany).

Nature (GB), vol.302, no.5909, p.599-600 (14 April 1983).

In the unique environment of the rings of Saturn, because of a combination of the magnetic field geometry and the meteoroid impact ionization at the ring plane, a thin plasma disk having a total thickness of no more than a few per cent of the planetary radius might exist in the vicinity of the ring system. The radial transport of this ring plasma to larger radial distances may act as an important source of the thermal plasma in Saturn's magnetosphere. The author suggests that the recent observations by the Voyager 2 Plasma Science team are not inconsistent with this scenario. (28 refs.)

96.50 OTHER OBJECTS IN THE PLANETARY SYSTEM

96.50G Comets

64425 Fluidization in the surface layer of cometary nuclei. I. A static layer at the fluidization threshold. L.M.Shul'man.

Astrometriya & Astrofiz. (USSR), no.47, p.62-9 (1982). In Russian.

A system of equations is derived to describe the static fluidized surface layer of a cometary nucleus. An exact solution of this system is found for the case when the layer is at the fluidization threshold. The temperature difference between the external surface of the dusty mantle and the surface of the ice under the mantle is shown not to depend on the dust layer thickness. The gas output of ice covered with a mineral mantle is shown to be three or four orders lower than that of the exposed ices. (7 refs.)

64426 Interaction between large cosmic bodies and atmosphere.

V.P.Korobeynikov (Math. Inst., Acad. of Sci., Moscow, USSR), P.I.Chushkin, L.V.Shurshalov.

Acta Astronaut. (GB), vol.9, no.10, p.641-3 (Oct. 1982). [received: March 1983]

The initial stage of movement of a large gaseous body in the Earth's atmosphere is calculated. For the Tunguska meteorite blast, the radiation and the thermal effect on the ground are computed using the multi-group spectrum approximation. Different types of trajectories of cosmic bodies having non-zero lift/drag ratio are found. (9 refs.)

64427 Periodic Comet Tempel 1 (1982j). J.-C.Merlin, J.Bortle, C.S.Morris.

I.A.U. Circ. (USA), no.3793, 1 pp. (19 April 1983).

Total visual magnitude estimates are reported for the period 1983 March 29 to April 18; the comet brightened from mag. 11.3 to mag. 10.4 during this time. (no refs.)

64428 A multi-fluid model of an H₂O-dominated dusty cometary atmosphere. M.L.Marconi, D.A.Mendis (Center for Astrophys. & Space Sci., Univ. of California, San Diego, La Jolla, CA, USA).

Moon & Planets (Netherlands), vol.27, no.4, p.431-52 (Dec. 1982).

A self-consistent multi-fluid solution of the dynamical and thermal structure of an H₂O-dominated, two-phase dusty-gas cometary atmosphere is obtained by solving the simultaneous set of differential equations representing conservation of number density, momentum and energy, together with the transfer of solar radiation in streams responsible for the major photolytic processes and the heating of the nucleus. The validity of this model, as in the earlier single-fluid ones, is restricted to the collision-dominated region where all the heavy species (ions and neutrals) are assumed to achieve a common temperature and velocity. Calculations are presented for a comet of radius 2.5 km with a dust/gas ratio of 1, at a heliocentric distance of 1 AU. (26 refs.)

96.60 SOLAR PHYSICS

64429 Dynamics and spectroscopy of asymmetrically heated coronal loops. J.T.Mariska, J.P.Boris (Naval Res. Lab., Washington, DC, USA).

Astrophys. J. (USA), vol.267, no.1, pt.1, p.409-20 (1 April 1983).

Investigates numerical models of steady flows along coronal magnetic flux tubes of varying cross sectional area. The flows are induced by altering the spatial symmetry of the heating. Calculations of the ionization balance and line emission for a number of ionization stages of oxygen suggest that heating induced flows may be responsible for the redshifts seen in spectral lines formed in the network at transition region temperatures. (27 refs.)

64430 Flare loop radiative hydrodynamics. IV. Dynamic evolution of unstable semiempirical loop models. C.-H.An, R.C.Canfield, G.H.Fisher, A.N.McClumont (Center for Astrophys. & Space Sci., Univ. of California, San Diego, CA, USA).

Astrophys. J. (USA), vol.267, no.1, pt.1, p.421-32 (1 April 1983).

For pt.1 see *ibid.*, vol.265, no.1, pt.1, p.507-18 (1983). The nonlinear phase of evolution of a thermally unstable coronal loop is followed by solving numerically the time-dependent equations of gasdynamics and radiative transfer. It is found that an unstable loop evolves, by chromospheric evaporation or condensation, on the coronal conductive time scale, even if the linear growth rate of the instability is much larger. (34 refs.)

64431 First-order Fermi acceleration in solar flares as a mechanism for the second-step acceleration of prompt protons and relativistic electrons. T.Bai, H.S.Hudson, R.M.Pelling (Center for Astrophys. & Space Sci., Univ. of California, San Diego, CA, USA), R.P.Lin, R.A.Schwartz, T.T.von Rosenvinge.

Astrophys. J. (USA), vol.267, no.1, pt.1, p.433-41 (1 April 1983).

Finds that for two of the hard X-ray bursts of an energetic flare on 1980 June 27, the time profile of the hard X-rays above 235 keV is delayed by 3 s with respect to the time profiles of the lower energy X-rays and that the high energy spectrum becomes flatter with time during each of these bursts. It is argued that during this flare a second-step mechanism accelerated further some of the high-energy tail population of the first-step electrons. After estimating the acceleration rate, it is concluded that first-order Fermi acceleration operating in a closed flare loop is a very likely mechanism for the second-step acceleration. (45 refs.)

64432 Preliminary observations of velocity fields at the solar poles. L.E.Cram (Sacramento Peak Obs., Sunspot, NM, USA), B.R.Durney, D.B.Guenther.

Astrophys. J. (USA), vol.267, no.1, pt.1, p.442-54 (1 April 1983).

The 13 m Littrow spectrograph at Sacramento Peak Observatory has been used to study the Doppler shift of Fe I $\lambda 5863$ in the polar regions of the Sun over a 20 day interval. The daily observations were assembled into a polar projection of the line-of-sight velocity field. The projection shows a very clear pattern of supergranulation. When a low-pass spatial filter is run over the data, a pattern of large-scale (80-100 Mm) velocity features can be seen. Cross-correlation studies show that the supergranular pattern rotates with a synodic period of 35 days, while there is evidence that the larger features rotate with a shorter period of about 30 days. (21 refs.)

64433 Very Large Array observations of solar active regions. III. Multiple wavelength observations. K.R.Lang, R.F.Willson (Dept. of Phys., Tufts Univ., Medford, MA, USA).

Astrophys. J. (USA), vol.267, no.1, pt.1, p.455-64 (1 April 1983).

For pt.II see *ibid.*, vol.247, no.1, pt.1, p.338-47 (1981). VLA synthesis maps of the active regions AR 2505 and AR 2646 at wavelengths of 2 cm, 6 cm, and 20 cm are presented and compared with the magnetic structure of the underlying photosphere. The 20 cm radiation in terms of the bremsstrahlung of thermal electrons trapped in magnetic loops. (31 refs.)

64434 The excitation of type II radio bursts in the corona. W.J.Wagner, R.M.MacQueen (High Altitude Obs., Nat. Center for Atmospheric Res., Boulder, CO, USA).

Astron. & Astrophys. (Germany), vol.120, no.1, pt.1, p.136-8 (April 1983).

Simultaneous radioheliograph and orbital coronagraph observation of coronal transient activity shows metric type II radio emission originating early in the event, well below the visible white light transient. It is suggested that the shock which excites the type II emission is independent of the transient, in the sense that it is initiated in the low corona (probably in association with a flare) and travels through the already-existing transient disturbance with a propagation speed significantly greater than that of the front edge of the transient itself. Radio emission then results when the flare shock overtakes, first, the region of principal density pile-up along the sides of the expanding transient and only later the top of the transient. (21 refs.)

64435 Does the solar activity cycle extend over more than an 11-year period? J.-L.Leroy, J.-C.Noens (Obs. du Pic-du-Midi, Bagnères-de-Bigorre, France).

Astron. & Astrophys. (Germany), vol.120, no.2, pt.2, p.181-2 (April 1983).

The authors have analysed coronal data obtained at Pic du Midi from 1944 to 1974, searching for the latitude variation of coronal activity. According to their results the whole evolution of activity in the corona spreads over a time lapse of about 17 years in agreement with the recent work of Legrand and Simon (1981). Therefore there is increasing evidence that the duration of an activity cycle is much longer than the time interval between two consecutive cycles. (13 refs.)

64436 Dynamical behaviour of surges. G.Banos (Dept. of Astron., Univ. of Ioannina, Ioannina, Greece), H.Dara-Papamargariti.

Astron. & Astrophys. (Germany), vol.120, no.2, pt.2, p.181-4 (April 1983).

Trajectories, velocity curves as a function of height and the force, besides gravity, acting on the surge material have been determined from time sequences of Ho-filtergrams of twenty-two surges of various sizes. The trajectories are found to be helical in shape. The deceleration, which takes place after the maximum velocity has been reached, is in most cases smaller than if gravity alone were acting and is attributed to a force due to the presence of the magnetic field. (25 refs.)

64437 Short period coronal oscillations: observation and interpretation. S.Koutchmy (Inst. d'Astrophys., CNRS, Paris, France), Y.D.Zugzda, V.Locans.

Astron. & Astrophys. (Germany), vol.120, no.2, pt.2, p.185-91 (April 1983).

The result of an experiment devoted to the search of short period coronal waves using the green coronal line 5303 Å of Fe XIV are analyzed. After the

subtraction of sky aureola fluctuations, two time series of measurements performed at a 40° height over a faint facular area and small changing chromospheric features show power spectra with evidence of Doppler velocity oscillations with periods near 300 s, 80 s, and especially 43 s. However, no prominent intensity fluctuations appeared. The observed waves are considered as good candidates for being resonant Alfvén oscillations viewed at a low level through several legs of coronal arches, with a typical distance between feet being equal to the autocorrelation distance of the network and with foot-points inserted in the photosphere. A model of such an arch is subsequently computed and seems to fit quite well the observed periods and velocity amplitudes. In addition the energy flux balance is evaluated and the role of such waves in the heating mechanism of coronal arches is discussed. (25 refs.)

64438 Investigation of nickel abundance in the solar atmosphere. B.T.Babii, M.B.Griyak, I.F.Margolych, R.E.Rykalyuk. *Astrometriya & Astrofiz. (USSR)*, no.47, p.22-7 (1982). In Russian. The abundance of neutral nickel in the solar photosphere is obtained from 78 Ni I lines. The Holweger and Muller photospheric model is preferred with a microturbulent velocity of 0.9 km/s, a macroturbulent velocity of 1.5 km/s and both components being independent of depth. The damping constant is found by fitting the observed and calculated line profiles. (17 refs.)

64439 Determination of the total photospheric velocity field from the Fraunhofer lines of different elements. N.N.Kondrashova. *Astrometriya & Astrofiz. (USSR)*, no.47, p.27-31 (1982). In Russian. The amplitude of the total photospheric velocity field is determined using weak lines of different elements. The velocity field at large depth and the influence of the damping constant are studied. The Van der Waals damping constant with the correction factor $E=2.5$ does not essentially change the amplitude of the photospheric velocity field in the optical depths $-3.0 \leq \lg \tau_5 \leq -0.5$. A decrease in the velocity amplitude at large depths has not been confirmed. (16 refs.)

64440 Oscillator strengths of ionized iron lines. R.I.Kostyk, T.V.Orlova. *Astrometriya & Astrofiz. (USSR)*, no.47, p.32-4 (1982). In Russian. Solar oscillator strengths are obtained from equivalent widths of 59 ionized iron lines. The internal accuracy of the results is determined. (15 refs.)

64441 Spectral features of filamentary physically nonhomogeneous prominences. II. Hydrogen (second level excitation, ionization). N.N.Morozhenko, V.V.Zharkova. *Astrometriya & Astrofiz. (USSR)*, no.47, p.34-41 (1982). In Russian.

Hydrogen emission is studied in homogeneous and nonhomogeneous (filamentary) prominences. A plane-parallel geometry and the five-level plus continuum model of the hydrogen atoms were used to solve the transfer equations for Lyman α and continuum emission. The second level excitation degree and a relative emission measure along the line of sight are obtained. (21 refs.)

64442 Investigation of damping constant for the neutral iron line profiles in undisturbed solar photosphere. B.T.Babii, L.I.Ben'ko, R.E.Rikalyuk. *Astrometriya & Astrofiz. (USSR)*, no.48, p.3-10 (1983). In Russian. The damping constant is determined for profiles of 32 solar Fe I lines. The enhancement factor E is shown to be different for the high and low excitation potentials and varies from 2 to 6. The damping constant increases slightly with the line excitation potential and decreases with a rise in its optical depth. Formulas for describing the dependence of the damping constant on the optical depth are suggested for calculating the equivalent widths of the lines. (29 refs.)

64443 Mesoturbulence. R.I.Kostyk. *Astrometriya & Astrofiz. (USSR)*, no.48, p.10-16 (1983). In Russian. The mean square mesoturbulent velocity in the solar photosphere (the Kubo-Anderson process) is depth-independent and is equal to 1.7 km s^{-1} . The correlation length decreases with the height from 750 km ($\lg \tau = -0.8$) to 350 km ($\lg \tau = -1.7$). For the solar photosphere the equation $\xi^2 = \nu_{\text{micro}}^2 + \nu_{\text{macro}}^2$ seems to hold accurately enough. (24 refs.)

64444 Spectral features of the filamentary and physically nonhomogeneous prominences. III. Structure and stratification of physical conditions. N.N.Morozhenko. *Astrometriya & Astrofiz. (USSR)*, no.48, p.16-25 (1983). In Russian.

For pt.II see ibid., no.47, p.34-41 (1982). In the framework of models of structurally and physically inhomogeneous quiescent prominences with $n_H = \text{const}$ the intensities of H_β , He I $\lambda 3880$ and Na I ($D_1 + D_2$) lines are calculated. Comparison of these data with observations resulted in estimation of structural and physical parameters of the prominences. (23 refs.)

64445 Undisturbed chromospheric structure observed above the solar limb. R.A.Gulyaev. *Astrometriya & Astrofiz. (USSR)*, no.48, p.25-32 (1983). In Russian.

From recent results of observations of the fine chromospheric structure it follows that the low chromosphere extends up to the height about 1500 km above the solar surface. The horizontal structures observed in the emission lines of metals (Na I, Mg I, Ca I, Ba II, Sr II) are predominant. At a height more than 1500 km the spicules observed in the H, He I and Ca II lines become the predominant element. The spicules undergo transverse oscillations which appear to result from the propagation of Alfvén waves. The motionless bases of the spicules are fixed on the boundary layer between the low and upper chromospheres. (29 refs.)

64446 Coherent scattering in the solar spectrum: survey of linear polarization in the range 3165-4230 Å. J.O.Stenflo, D.Twerenbold (Inst. of Astron., ETH-Zentrum, Zurich, Switzerland). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.52, no.1, p.161-80 (April 1983).

The linear polarization 10 sec of arc inside the solar limb has been recorded over the wavelength range 3165-4230 Å with the vertical spectrograph of the Kitt Peak McMath telescope. This polarization is caused by coherent resonant and fluorescent scattering in the solar atmosphere. The polarization observed in several multiplets of Fe I, as well as in 1 Ca II, 3 Mg I, and 22 Co I is affected by quantum-mechanical interference between the excited states of different total angular momenta. The CN molecule shows significant polarization, increasing to a maximum at each band head. Unexpectedly large polarization is found among others in 21 Ni I, 2 Ti II, 1 Cu I, as well as in a number of Fe I lines. The continuum polarization increases steeply with decreasing wavelength, and is generally larger than the intrinsic line polarization. (12 refs.)

64447 A variation in the mesh of the photospheric granular network with solar activity. C.J.Macris (Acad. of Athens, Athens, Greece), J.Rosch. *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.4, p.265-8 (31 Jan. 1983). In French.

For the period 1966-1978, a negative correlation has been found between the mean center-to-center distance of the granules and solar activity as expressed by the Wolf number or by the radio-flux at 2800 MHz. This behaviour results from a global shrinking of the histogram towards small distances when the activity increases. (11 refs.)

64448 Solar irradiance variations. I. Analysis of modeling techniques and intercomparison of ground-based data. L.Oster (Lab. for Planetary Atmospheres, NASA Goddard Space Flight Center, Greenbelt, MD, USA).

J. Geophys. Res. (USA), vol.88, no.A3, p.1953-64 (1 March 1983). Computes the full disc irradiance at 2800 MHz ("F10.7") on the basis of individual active regions (ARs) on the Sun as observed in the light of the Ca II K line at 393 nm. The solar radio emission is used as a stand-in for UV measurements from above the atmosphere, since it does not have significant calibration problems, and since day by day records are available for many years. The author illustrates in detail the techniques for parameterization of the model calculations which, with few changes, are applicable to UV measurements. In addition to the excellent overall agreement and the impressively close correspondence of day to day variations, no indication of a systematic discrepancy between model and observations over the entire 10-year period was found. Nor is there a contribution to the 2800 MHz irradiance that is not directly related to individual ARs on the Sun at any given day. (15 refs.)

64449 Radio communication and sunspots. J.Kennell (Ionospheric Prediction Service, Learmonth Solar Obs., Learmonth, Australia). *Pract. Wireless (GB)*, vol.59, no.4, p.49-53 (April 1983). Discusses sunspots and its effects on radio communication. The solar ionising radiations, the sunspot number and method of counting sunspots are considered. (no refs.)

64450 Energetics of particles accelerated in solar flares. L.G.Kocharov. *Pis'ma v Astron. Zh. (USSR)*, vol.9, no.2, p.125-7 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*. A method is proposed for the determination of the minimal energy of particles accelerated in solar flares, based on the observed anticorrelation between the spectral index and particle flux. The total energy of the accelerated particles is estimated. (12 refs.)

64451 Solar radio noise registrations at the Oslo Solar Observatory, 1975-81 and comments on the whole series of measurements 1954-81. O.Elgaroy, O.Hauge. *Report 54*, Univ. Oslo, Blindern, Norway (1982), 40 pp.

Observations of solar radio noise have been performed at Oslo Solar Observatory at Harestua since 1954. Since September 1973 the observing frequency has been 228 MHz. The author presents observational data for the years 1975-81. It is a continuation of Report no. 12 which covered the years 1958-59, Report no. 16 for the years 1960-64 and Report no. 48 which contained data for the period 1965-74. The description of the method of tabulation of data is almost the same as in previous reports. In 1981 the observations of solar radio noise were brought to an end. Three sunspot maxima and the two intervening minima were covered. A discussion of the whole series of measurements is undertaken. (4 refs.)

64452 Mass loss from rotating magnetic stars: Weber and Davis revisited. K.B.MacGregor, V.J.Pizzo (High Altitude Obs., Nat. Center for Atmospheric Res., Boulder, CO, USA).

Astrophys. J. (USA), vol.267, no.1, pt.1, p.340-3 (1 April 1983). The model of Weber and Davis (1967) for the flow of a magnetically coupled wind from a rotating star is reexamined in the light of criticisms by Barker and Marlborough (1982). When differences in the respective definitions of the stellar angular velocity are reconciled, it is found that the extended theory proposed by the latter authors is equivalent to the original Weber and Davis description. (16 refs.)

64453 QUIPS: time-dependent properties of quasi-invariant self-gravitating polytropes. A.Munier, M.R.Feix (Centre d'Etudes de Limeil, CEA, Villeneuve-St-Georges, France).

Astrophys. J. (USA), vol.267, no.1, pt.1, p.344-57 (1 April 1983). Quasi-invariance, a method based on group transformations, is used to obtain time-dependent solutions for the expansion and/or contraction of a self-gravitating sphere of perfect gas with polytropic index n . Quasi-invariance transforms the equations of hydrodynamics into 'dual equations' exhibiting extra terms such as a friction, a mass source or sink term, and a centripetal/centrifugal force. The search for stationary solutions in this 'dual space' leads to a new class of time-dependent solutions, the QUIP (for quasi-invariant polytrope), which generalizes Emden's static model and introduces a characteristic frequency related to Jeans's frequency. The second order differential equation describing the solution is integrated numerically. A critical point is seen to exist for $n \neq 3$. Solutions corresponding in the 'dual space' to a time-dependent generalization of Eddington's standard model ($n=3$) are discussed. (16 refs.)

64454 On the stability of rotating stellar models in general relativity theory. L.Lindblom (Inst. of Theoretical Phys., Dept. of Phys., Stanford Univ., Stanford, CA, USA), W.A.Hiscock.

Astrophys. J. (USA), vol.267, no.1, pt.1, p.384-401 (1 April 1983). Investigates the effects of viscosity, and thermal conductivity on the stability of rotating stellar models in general relativity theory. The equations of motion for the perturbed fluid stellar model (including nonadiabatic and dissipative effects) are used to construct an energy functional for the perturbed motion

of the star. This energy is used to investigate the stability of rotating stellar models. (29 refs.)

64455 Necessary conditions for the stability of rotating Newtonian stellar models. L.Lindblom (Inst. of Theoretical Phys., Dept. of Phys., Stanford Univ., Stanford, CA, USA).

Astrophys. J. (USA), vol.267, no.1, pt.1, p.402-8 (1 April 1983).

It is shown that the positivity of a certain energy functional for the perturbations of a rotating stellar model is a necessary condition for stability. The stellar models considered are composed of viscous and thermally conducting fluid, whose equilibrium states are necessarily rigidly rotating and isothermal. The perturbations are not restricted to be adiabatic or axisymmetric. This work generalizes the results of Barston (1969, 1970) who proved an analogous necessity theorem for nonrotating dissipative fluid stellar models. (14 refs.)

64456 Stellar coronae: What can be predicted with minimum flux models? R.Hammer (Joint Inst. for Lab. Astrophys., Univ. of Colorado, Boulder, CO, USA), F.Endler, P.Ulmschneider.

Astron. & Astrophys. (Germany), vol.120, no.1, pt.1, p.141-6 (April 1983).

To determine the possible errors of various minimum flux corona (MFC) predictions, the authors compare MFC models with a grid of detailed coronal models that covers a range of two orders of magnitude in both the total amount ϕ_{M0} of coronal heating and the characteristic damping length L . For given ϕ_{M0} , the pressure at the base of the transition region has a maximum as a function of L . This maximum possible pressure is the only quantity that can be predicted with sufficient accuracy by the MFC concept. MFC predictions of the mass loss rate and of the energy losses due to stellar wind can be wrong by many orders of magnitude. The unreliable MFC formulae should be replaced by a grid of detailed models which account for the coronal dependence on L . (38 refs.)

64457 UVB photometry of FK4 and FK4 supplement stars. T.Oja (Astron. Obs., Uppsala, Sweden).

Astron. & Astrophys. Suppl. Ser. (France), vol.52, no.1, p.131-4 (April 1983).

UVB photometry is presented for 320 stars of the FK4 and FK4 Supplement catalogues. (no refs.)

64458 Molecular clouds and star formation. C.M.Walmsley (Max Planck Inst. fur Radioastron., Bonn, Germany)

Irish Astron. J., vol.15, no.3, p.161-80 (March 1982). [received: April 1983]

An overview is given of recent theoretical and observational developments relevant to star formation. In particular, some theoretical models of protostar evolution are discussed as well as current ideas concerning the causes of the collapse of a protostellar gas cloud. Observational data, relevant to the formation of low mass stars in nearby dust clouds, is reviewed. Finally, as an example of high mass star formation, recent radio and infrared observations of the Orion molecular cloud are discussed. (42 refs.)

64459 Some common peculiarities of solar and stellar magnetic fields. S.I.Gopasyuk, A.B.Severnyi.

Pis'ma v Astron. Zh. (USSR), vol.9, no.2, p.120-4 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*

The measured values of the ratio of magnetic field strengths in active and quiet regions on the Sun are shown to be dependent on the equivalent width of different Fe I lines. This dependence is similar to that obtained for magnetically variable stellar rotators. A possible explanation of this effect by a difference in chemical composition of quiet and active regions is proposed. (9 refs.)

64460 Charged particle reaction cross sections and nucleosynthesis. D.G.Sargood (School of Phys., Univ. of Melbourne, Parkville, Victoria, Australia).

Phys. Rep. (Netherlands), vol.93, no.2, p.61-116 (Dec. 1982).

The role of proton and α -particle induced reactions in carbon, neon, oxygen and silicon burning in massive stars is surveyed. The problems associated with determining thermonuclear reaction rates for reactions with widely spaced resonances and with closely spaced or overlapping resonances are discussed and the associated experimental approaches are reviewed. Experimental techniques which have been used in the measurement of reaction cross sections are discussed and their strengths and weaknesses are identified. Recent developments in attempts to establish reliable statistical-model codes for calculation of reaction cross sections are presented and discussed. Finally, the results of experimental tests of statistical model codes are summarised and evaluated. (92 refs.)

97.20 NORMAL STARS (BY CLASS): GENERAL OR INDIVIDUAL

64461 Chemical separation in horizontal-branch stars. G. Michaud (Dept. de Phys., Univ. de Montreal, Montreal, Quebec, Canada), G. Vauclair, S. Vauclair.

Astrophys. J. (USA), vol.267, no.1, pt.1, p.256-70 (1 April 1983). Abundance anomalies are predicted to be produced by diffusion processes in horizontal-branch (HB) and halo Population II stars. If the outer envelope is stable enough for the gravitational settling of He to be efficient, it is shown that overabundances of heavy elements are simultaneously produced. Abundance anomalies as large as 10^{-3} to 10^{-4} are expected. Detailed calculations of selective radiative accelerations and of the time evolution of abundances are presented for C, N, O, Ca, Fe, and Sr in a series of models representative of HB stars. These abundance anomalies may be important for what is called the 'second parameter problem' in globular clusters. By detailed time dependent calculations, helium underabundances and relative overabundances of ^3He are shown to be produced well within the lifetime of stars on the horizontal branch. The implications of helium underabundances on the pulsational properties of RR Lyrae variables are discussed. The role of turbulent mixing in reducing the abundance anomalies is also discussed. (71 refs.)

64462 Identification and properties of the M giant/X-ray system HD 154791 = 2A 1704+241. M. Garcia, S.L. Balunas, R. Dossy, M. Elvis, G. Fabiano (Harvard-Smithsonian Center for Astrophysics, Cambridge, MA, USA), G. Koenigsberger, J. Patterson, D. Schwartz, J. Swank, M.G. Watson.

Astrophys. J. (USA), vol.267, no.1, pt.1, p.291-300 (1 April 1983). Identifies the Ariel V X-ray source 2A 1704+241 (=4U 1700+24=3A 1703+241) with the M3 II star HD 154791. The identification is based on a precise X-ray position determined by the HEAO 1 scanning modulation collimator and the Einstein Observatory imaging proportional counter, together with a spectrum measured by the International Ultraviolet Explorer. The ultraviolet spectrum shows strong emission of C IV $\lambda 1550 \text{ \AA}$, N V $\lambda 1238 \text{ \AA}$, and Mg II $\lambda 2800 \text{ \AA}$, which is very unusual among M giants. This is the first X-ray detection of an M giant which has a completely normal optical spectrum. The X-ray luminosity reaches orders of magnitude above the mean upper limit for the coronal X-ray flux from M giants. A plausible neutron star binary model can be constructed. (52 refs.)

64463 Meridional circulation in rotating stars. V. Cooling white dwarfs. M. Tassoul, J.-L. Tassoul (Dept. de Phys., Univ. de Montreal, Montreal, Quebec).

Astrophys. J. (USA), vol.267, no.1, pt.1, p.334-9 (1 April 1983). For pt.IV see *ibid.*, vol.264, no.1, pt.1, p.298-301 (1983). Discusses the large-scale meridional circulation and concomitant differential rotation in a cooling white dwarf that does not greatly depart from spherical symmetry. It is found that the circulation velocities are utterly negligible in the degenerate interior as well as in the thin nondegenerate envelope, where the presence of a (turbulent) viscous boundary layer allows the velocities to satisfy all of the surface boundary conditions. There are no $1/\rho$ singularities in the meridional flow. The back reaction of the circulatory currents on the overall rotation rate is not very large either, thus implying at most a mild differential rotation when departure from sphericity is small. (7 refs.)

64464 Spectral line profiles from spherical shells. R. Wagenblast, C. Bertout, U. Bastian (Landessternwarte Konigstuhl, Heidelberg, Germany).

Astron. & Astrophys. (Germany), vol.120, no.1, pt.1, p.6-14 (April 1983). Studies line profiles formed in spherical, radially thin shells. The effects of the shell dimensions and line formation parameters on the profiles are investigated and it is shown that type III P Cygni profiles can easily be formed in this framework. It is demonstrated that the apparent contradiction caused by the simultaneous presence in the spectra of YY Orionis stars of a Type III P Cygni profile at H_α and inverse P Cygni profiles at the higher Balmer lines can be resolved if the Balmer lines arise in a shell detached from the star. Some physical implications of this new picture are briefly discussed. (14 refs.)

64465 Model-atmosphere analysis of high-dispersion spectra of four red giants and supergiants. N. Kovacs (Inst. fur Theoretische Phys. und Sternwarte, Univ. Kiel, Kiel, Germany).

Astron. & Astrophys. (Germany), vol.120, no.1, pt.1, p.21-35 (April 1983). A model atmosphere analysis of three cool giants (β Cet, α Tau, α TrA) and one supergiant (ϵ Peg) is presented. Measured lines are split into high excitation lines and low excitation lines in order to test the sensitivity of the ionization balance method against deviations from LTE. Even though for iron no pronounced split can be found to occur, other elements, e.g. Mn and Ni, hint at the existence of deviations from LTE in cool giant stars. Deviations from the solar abundance pattern are found for the elements of medium atomic number. Two of the stars (α TrA and ϵ Peg) display over-abundances in barium. (51 refs.)

64466 A discussion of the infrared and radio region of the calculated spectral energy distribution of O-type stars. M. Groot, P.S. The (Astron. Inst. Anton Pannekoek, Univ. of Amsterdam, Amsterdam, Netherlands).

Astron. & Astrophys. (Germany), vol.120, no.1, pt.1, p.89-96 (April 1983). The results of numerical calculations of the emerging radiation of O-type stars having an accelerated mass outflow are presented. This radiation consists of the free-free emission from the extended gaseous envelope, superposed on the attenuated flux of the star. It is argued that the discrepancies found by various authors for the mass loss rate of O-type stars determined using observed infrared and radio fluxes are caused by an inadequate treatment of the measured infrared fluxes. (39 refs.)

64467 Evolution of chemical abundances in massive stars. I. OB stars, Hubble-Sandage variables and Wolf-Rayet stars. Changes at stellar surfaces and galactic enrichment by stellar winds. A. Maeder (Geneva Obs., Sauverny, Switzerland).

Astron. & Astrophys. (Germany), vol.120, no.1, pt.1, p.113-29 (April 1983). Evolutionary models with mass loss and a detailed study of changes in the abundances of ^1H , ^3He , ^4He , ^{12}C , ^{13}C , ^{14}N , ^{15}N , ^{16}O , ^{17}O , ^{18}O , ^{20}Ne , ^{22}Ne , ^{23}Mg , and ^{26}Mg are made for initial stellar masses of 120, 85, and 60 M_\odot . The evolution has been followed through stages corresponding to OB stars, blue supergiants, Hubble-Sandage variables and various Wolf-Rayet stages (WNL, WNE, WC, WO). The evolutionary status of the Hubble-Sandage variables is examined. The origin of the variability of the Hubble-Sandage variables is discussed in relation with the instability limit (de Jager's limit) for deep turbulent external convective zones in supergiants. Comparisons are made between the theoretical C/He, N/He, and C/N ratios and those observed by Smith and Willis (1982) and by Nugis (1982) for WNL, WNE, and WC stars. The contributions of the winds of WR star to the galactic enrichment in various elements and isotopes is estimated. (82 refs.)

64468 Oscillator strengths and Ne abundance in B stars. A. Magazzu, V. Pirronello, G. Strazzulla (Osservatorio Astrofisico di Catania, Citta Univ., Catania, Italy).

Astron. & Astrophys. (Germany), vol.120, no.1, pt.1, p.139-40 (April 1983). The scaled Thomas-Fermi method and the j - K coupling scheme are used to calculate the oscillator strengths for some Ne I lines of primary astrophysical interest, comparing them with other values given in the literature. The values appear systematically a little greater (mean difference $\approx +0.12$) than those of other sources. The Ne abundance in B stars is then discussed in the light of these results. (13 refs.)

64469 Linear polarization variations of six T Tauri stars. R. Schulte-Ladbeck (Landessternwarte, Heidelberg, Germany).

Astron. & Astrophys. (Germany), vol.120, no.2, pt.2, p.203-14 (April 1983). Linear polarization observations of the T Tauri stars RV Tau, DR Tau, SU Aur, RW Aur, V 1331 Cyg, and DI Cep are presented. Two of these stars were known to show variable polarization. The four remaining stars are also identified to be polarimetric variables. The wavelength dependence of the polarization is consistent with the presence of dust grains (with a large range of sizes) in asymmetric circumstellar envelopes. The polarization varies irregularly on a time scale down to days. Periodic variation could not be detected. For RW Aur, the trajectory of the polarization vector in the Stokes parameter plane suggests short-term mass flow variations with a fixed axis of symmetry. The intrinsic position angle of RY Tau rotates in the Stokes parameter plane with a time scale of months, indicating that we might observe scattering material orbiting around this star. (20 refs.)

64470 Stellar interferometry: diameters and effective temperatures of five giant stars. M. Faucher, D. Bonneau, L. Liechti, F. Vakili (Centre d'Etudes et de Recherches Géodynamiques et Astron., Obs. du Calern, Saint Vallier de Thiey, France).

Astron. & Astrophys. (Germany), vol.120, no.2, pt.2, p.263-8 (April 1983). In French.

The authors report angular diameter measurements of α Ari, β Gem, β Umi, γ Dra, and δ Dra, performed from November 1980 to January 1982 using the two-telescope stellar interferometer (12T) at CERGA. To determine the diameter for the equivalent uniform disk the method used is inspired by that of Michelson: it is based on a visual detection of very low contrast fringes for the largest possible baseline. A laboratory simulator of 12T observation conditions has allowed a calibration of fringe contrast measurements; it yields the minimum value of the contrast detectable by eye. The diameter of α Lyr measured by 12 T then confirms the measurement by intensity interferometry (Hanbury Brown et al. 1974a). From eight red giant angular diameters and from the computation of the bolometric fluxes of those stars, effective temperatures are determined. Good agreement is obtained with the $T_{\text{eff}} - (V-K)$ relation, established from lunar occultation diameters and infrared photometry. The authors generally find diameters smaller than from indirect or theoretical methods. (37 refs.)

64471 The ultraviolet spectrum of the supermassive object R136a. I. The mass loss rate. J.V. Feitzinger, R.W. Hunschik, T. Schmidt-Kaler (Astron. Inst., Ruhr-Universität Bochum, Bochum, Germany).

Astron. & Astrophys. (Germany), vol.120, no.2, pt.2, p.269-77 (April 1983). The short and long wave spectrum (1150-3000 \AA) of the central supermassive object in the 30 Doradus Nebula, 136a, is analyzed. The equivalent widths of the lines attributed to R136a are tabulated. The P Cyg lines of C IV, N IV, N V, He II, and Si II of the stellar wind of R136a are presented. The mass loss rate $M = 310^{-4} M_\odot/\text{yr}$ is derived from the line profiles of C IV and N V by line fitting assuming ionization equilibrium. (41 refs.)

64472 The spectra of late type dwarfs and sub-dwarfs in the near ultraviolet. II. Limits to variability in Mg II emission from IUE spectrophotometry. L. Crivellari, M.L. Franco, P. Molaro, G. Vladilo (Osservatorio Astron. di Trieste, Trieste, Italy), J.E. Beckman.

Astron. & Astrophys. Suppl. Ser. (France), vol.52, no.1, p.135-42 (April 1983).

For pt.I see *ibid.*, vol.47, no.2, p.295-317 (1982). The authors have monitored, over a period of some four years, the chromospheric h and k emission cores of the G dwarfs and sub-dwarfs β Jyi (14), ζ Tuc (5), δ Pav (5) and τ Cet (5), using the long wavelength (LWR) camera of the IUE satellite. The authors supplemented their own data with equivalent IUE archive spectra. Precise and detailed statistical examination of the data shows that no variation in h or k fluxes of less than 15% could have been detected using this technique. This limit applies, even after removing the effects of saturation, of variable gain, and (as far as practicable) of scattered light between echelle orders, and clearly applies to any astrophysical use of comparable IUE data. No flux excursions larger than this value were detected in any of the objects. (10 refs.)

64473 ψ^3 Piscium and the rotation-activity connexion. D.F. Stickland, D. Williams (Royal Greenwich Obs., Hailsham, England).

Observatory (GB), vol.103, no.1053, p.58-62 (April 1983). IUE observations of the rapidly rotating ψ^3 Psc and a number of RS CVn systems, together with data from the literature, have been studied to clarify the relationship between axial rotation and chromospheric activity. (19 refs.)

97.30 VARIABLE AND PECULIAR STARS

(inc. novae)

- 64474 Radial velocity studies of cataclysmic binaries. I. KR Aurigae.** A.W.Shafter (Dept. of Astron., Univ. of California, Los Angeles, CA, USA). *Astrophys. J. (USA)*, vol.267, no.1, pt.1, p.222-31 (1 April 1983).
 Presents spectroscopic observations of KR Aur which reveal the object to be a close binary system with an orbital period of 3.907 hr. This result, in conjunction with the overall spectroscopic characteristics of the object, confirm the classification of KR Aur as a cataclysmic variable. Under this assumption, masses of 0.7 and 0.48 M_{\odot} are estimated for the white dwarf and the red dwarf, respectively. The methods employed in measuring the radial velocities and in estimating the masses are discussed. (37 refs.)
- 64475 Time-resolved spectrophotometry of the nova-like variable RW Trianguli.** R.H.Kaitchuck, R.K.Honeycutt, E.M.Schlegel (Astron. Dept., Indiana Univ., Bloomington, IN, USA). *Astrophys. J. (USA)*, vol.267, no.1, pt.1, p.239-55 (1 April 1983).
 The nova-like system RW Tri has been observed with the 2.1 m telescope and the IIDS of KPNO, resulting in 200 time-resolved photometric-quality spectra. These spectra simultaneously yield continuum photometry, emission line fluxes, line profiles, and radial velocities at all phases of the 5 hour 34 minute period of RW Tri. Estimates of the orbital inclination, stellar masses, and disk size are presented. (24 refs.)
- 64476 Carbon stars and the seven dwarfs.** M.Aaronson (Steward Obs., Univ. of Arizona, Tucson, AZ, USA), E.W.Olszewski, P.W.Hodge. *Astrophys. J. (USA)*, vol.267, no.1, pt.1, p.271-9 (1 April 1983).
 Reports the discovery of carbon stars in the Leo I, Leo II, and Ursa Minor dwarf spheroidal galaxies. Such stars have now been identified in all seven of the dwarf spheroidal galaxies known to surround the Milky Way. C_2 and CN band strengths are presented; while these are well correlated with each other, there appears to be a wide range in band strength at fixed color. The number of carbon stars does not seem to be a simple function of parent galaxy luminosity, nor, by implication of metallicity. The first measured radial velocities for the Leo dwarf galaxies are also reported. (46 refs.)
- 64477 Coordinated Einstein and IUE observations of a disaripions brusques type flare event and quiescent emission from Proxima Centauri.** B.M.Haisch (Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA), J.L.Linsky, P.L.Bornmann, R.E.Stencel, S.K.Antiochos, L.Golub, G.S.Vaiana. *Astrophys. J. (USA)*, vol.267, no.1, pt.1, p.280-90 (1 April 1983).
 Reports simultaneous Einstein and IUE observations of the dM5e flare star Proxima Centauri during a 5 hour period in 1980 August. A major X-ray flare was observed in its entirety with the Einstein IPC. The authors present a detailed X-ray light curve, temperature determinations during various intervals, and UV line fluxes before, during and after the flare. There is indirect evidence for a 'two-ribbon flare'-like prominence eruption. The corona of Proxima Cen is analyzed in the context of static loop models; less than 6% of the stellar surface seems to be covered by X-ray emitting active regions. (55 refs.)
- 64478 Infrared photometry of southern Wolf-Rayet stars.** A.Pitault, N.Epchein, A.E.Gomez, M.C.Lortet (Section d'Astrophys. de Meudon, Obs. de Paris, Meudon, France). *Astron. & Astrophys. (Germany)*, vol.120, no.1, pt.1, p.53-7 (April 1983).
 New JHKL photometric observations of forty-nine southern Wolf-Rayet stars are presented. After correcting the magnitudes for emission line contribution, the position of the different subtypes in a $H-K-L$ colour diagram is discussed. Except for the late type WC stars, no evidence is found for a relationship between near infrared excess and spectral type. Comparison of the observed flux distribution with the empirical model of Hartmann and Cassinelli suggests a variation from star to star in the velocity law of the wind. In the near infrared range, the different subtypes constitute heterogeneous groups. (31 refs.)
- 64479 Evolution of chemical abundances in massive stars. II. Abundance anomalies in Wolf-Rayet stars in relation with cosmic rays and ^{22}Ne in meteorites.** A.Maeder (Geneva Obs., Sauverny, Switzerland). *Astron. & Astrophys. (Germany)*, vol.120, no.1, pt.1, p.130-5 (April 1983).
 For pt.1 see *ibid.*, vol.120, no.1, p.113-29 (1983). A close comparison is made between the very anomalous abundances found in models of Wolf-Rayet stars and the excesses of several isotopic ratios in the galactic cosmic rays (GCR). Attention is paid to the dilution problem of one peculiar GCR source in the overall flux. The reliable excesses of the abundance of ^{12}C , of the isotopic ratios $^{22}\text{Ne}/^{20}\text{Ne}$, $^{25}\text{Mg}/^{24}\text{Mg}$, and $^{26}\text{Mg}/^{24}\text{Mg}$ in GCR can be remarkably well accounted for by a unique dilution factor of 1 particle originating from WR stars among 50 particles in the overall GCR flux. The author examines whether the anomalous neon component (Ne-E heavily enriched in ^{22}Ne) in some carbonaceous chondrites could originate from grains condensed in the winds of some pre-solar WC stars. WC stars appear to be important contributors to the galactic enrichment in ^{22}Ne . (48 refs.)
- 64480 The flare activity of V780 Tau.** B.R.Pettersen (Inst. of Math. & Phys. Sci., Univ. of Tromsø, Tromsø, Norway). *Astron. & Astrophys. (Germany)*, vol.120, no.2, pt.2, p.192-6 (April 1983).
 Photoelectric flare monitoring has revealed seventeen U-filter flares on V780 Tau. The flares occurred with a time spacing between 2 and 36 min (average of 14 min). Analysis of the cumulative energy distribution of the flares concludes that forty-seven per cent of the U-filter radiation from the star is generated by flare activity. This puts V780 Tau among the most active flare stars in the solar neighbourhood. In many respects V780 Tau resembles the prototype flare star system UV Cet. The majority of the flares are low energy small amplitude events that occur frequently. The data are used to test the 'reservoir hypothesis' for stellar flares, but no support is found for expected correlations between interflare spacings and the quantities of the preceding or the next flares. (10 refs.)
- 64481 The ultraviolet reddening of Be stars.** R.Schild (Harvard-Smithsonian Center for Astrophysics, Cambridge, MA, USA). *Astron. & Astrophys. (Germany)*, vol.120, no.2, pt.2, p.223-6 (April 1983).
 Following the demonstration by Schild (1978) that many Be stars have an intrinsic $(B-V)$ color excess, the author examines the ultraviolet extinction of several bright Be stars. It is found that stars having an intrinsic $(B-V)$ color excess do not have the 0.22 μ bump found in the interstellar reddening law of Bless and Savage (1972). (11 refs.)
- 64482 R 66(Aeq): an LMC B supergiant with a massive cool and dusty wind.** O.Stahl, B.Wolf, F.-J.Zickgraf (Landessternwarte, Heidelberg, Germany), U.Bastian, M.J.H.de Groot, C.Leitherer. *Astron. & Astrophys. (Germany)*, vol.120, no.2, pt.2, p.287-96 (April 1983).
 High dispersion spectroscopic groundbased and IUE observations and UBV and infrared (JHKLM) photometric observations of the peculiar emission line star R 66 (Aeq) in the LMC are discussed. From the data the authors derive a model consisting of a massive ($M=30 M_{\odot}$), luminous ($L=310^5 L_{\odot}$) B-type supergiant ($T_{\text{eff}}=12000\text{K}$, $\log g=2.0$). This star is surrounded by a dense, rather cool ($T=8000\text{K}$) expanding envelope and a circumstellar dust shell with a temperature of $T=1100\text{K}$ at its inner edge. The massive flow ($M=310^5 M_{\odot} \text{ yr}^{-1}$) has a measured maximum velocity ($v_{\text{max}}=307 \text{ km s}^{-1}$) equal to the surface escape velocity and can be characterized by a ballistic velocity law. This particular decelerated massive wind of R66 is supposed to create the favourable conditions for the formation of dust grains in its outer parts. R66 belongs to the massive ($M \geq 25 M_{\odot}$) post-main-sequence envelope objects characterized by drastic mass-loss rates of the order of a few times $10^{-5} M_{\odot} \text{ yr}^{-1}$. Although not having shown any variations, a detailed comparison revealed that R66 has many characteristics in common with S Dor variables during maximum phase. The authors give arguments that massive stars may spend about 20% of their B supergiant evolutionary phase as drastic mass losers. (30 refs.)
- 64483 Intrinsic colours and absolute magnitudes of selected R Coronae Borealis variables.** A.E.Rosenbush. *Astrometriya & Astrofiz. (USSR)*, no.47, p.17-21 (1982). In Russian.
 Analyzes observational data for S Apodis, XX Camelopardalis, V and WX Coronae Austrinae, R Coronae Borealis, Y Muscae, RT Normae, RY Sagittarii, and RS Telescopii. (21 refs.)
- 64484 HR 6522: a previously unknown multiperiodic delta Scuti star.** C.Waelkens (Obs. de Geneve, Geneva, Switzerland), P.Bartholdi. *Astron. & Astrophys. Suppl. Ser. (France)*, vol.52, no.1, p.1-12 (April 1983).
 Multiperiodic light and colour variations are reported for the F2 giant HR 6522. Since this star belongs to the instability strip, it can be classified as a δ Scuti star. The pulsation periods are 0.21712 days, 0.13885 days and 0.11160 days. From various considerations it appears that these three pulsation components can be identified with the fundamental radial mode and the second and the third radial overtones, respectively. (8 refs.)
- 64485 On the variability of the two brightest stars in the galactic cluster IC 2391.** C.Waelkens (Obs. de Geneve, Geneva, Switzerland), F.Rufener. *Astron. & Astrophys. Suppl. Ser. (France)*, vol.52, no.1, p.21-5 (April 1983).
 Short-period pulsations have been suspected for the two brightest stars of the galactic cluster IC 2391. New photometric data show that both stars are indeed variable, but on a longer time scale. For omicron Velorum, a period of 2.779 days is found, and it is shown that the existing data are consistent with this period. For HR 3467, a period of 1.553 days is derived. None of these stars varied on a shorter time scale. Possible explanations for the observed variations are discussed. (16 refs.)
- 64486 High speed photometry of PG0244+104.** B.Warner (Dept. of Astron., Univ. of Cape Town, Cape Town, S Africa). *Inf. Bull. Variable Stars (Hungary)*, no.2295, p.1 (17 March 1983).
 The author reports high speed photometry on 1982 December 18 of the cataclysmic variable candidate PG 0244+104. A light curve obtained during two hours of observations is presented; the evident photometric activity in this light curve shows the star to be a rapid variable of the cataclysmic class. In addition, the mean light level of the star corresponds to a B-magnitude of about 14.7, considerably brighter than the B-magnitude of 15.8 found by Green et al. (1982). (1 ref.)
- 64487 The nature of the cool component of the BX Monocerotis symbiotic system.** P.A.Whitelock, R.M.Catchpole (South African Astron. Obs., Cape Town, S Africa). *Inf. Bull. Variable Stars (Hungary)*, no.2296, p.1-3 (18 March 1983).
 BX Monocerotis is a peculiar variable star that at first sight appears to be a symbiotic star in which the cool component is a Mira variable: it undergoes large-amplitude light variations with a period of 1374 days, and it has a composite spectrum with very strong H I emission lines. The authors report infrared observations which indicate that the cool component of the star is not, in fact, a Mira variable. First, the infrared colours obtained from JHKL photometry on 1982 November 20 do not fall in the regions of the IR two-colour diagrams occupied by Mira variables, nor do they indicate the presence of the dust excess typical of symbiotic systems containing Mira variables. Second, the near-IR spectrum (1.2 to 2.5 μ) of BX Mon, obtained on 1983 January 28, is typical of a non-Mira M-type giant, except for the presence of Paschen- β emission. The cool component of the system appears from these observations to be a normal M5 III star. It is suggested that the strong Balmer emission lines originate in the nebulosity surrounding the binary system, and that they are excited by the hot component. The light variations are more difficult to explain: they are not typical of a semi-regular variable star, and the authors suggest that they are actually associated with the orbital motion of the binary system. (8 refs.)
- 64488 On the constancy of the period of the magnetic Ap star HD 215441.** A.Hempelmann, W.Schoneich (Astrophys. Obs. Potsdam, Potsdam, Germany). *Inf. Bull. Variable Stars (Hungary)*, no.2297, p.1-3 (18 March 1983).
 The authors briefly describe a method for determining the brightness distribution over the surface of a magnetic Ap star, and for deriving the phase angle (θ) at which the centre of the photometrically peculiar region crosses the line of sight. This method is applied to an investigation of the period of light variation of HD 215441. First the wavelength dependence of θ is determined using the light curves obtained from ten-colour photometry (Schoneich et al., 1976) and from UV photometry (Leckrone 1974). It is found that θ is constant for $\lambda > 2000 \text{ \AA}$. Second, the angle θ is computed for all the available photometric observations using the elements $JD_0=2441902.49+9.4875 E$, and the values of θ are presented as a function of time from 1960 to 1982. There is no significant variation of θ during this time, and it therefore concluded that during the last 22 years there has been no change in the period of HD 215441. (9 refs.)
- 64489 Spectrum of 11 Cam in 1980-1981.** L.S.Luud, V.A.Mineva, B.Zh.Kovachev. *C.R. Acad. Bulg. Sci. (Bulgaria)*, vol.35, no.9, p.1177-80 (1982). In Russian.
 Observations were made in late 1980 and early 1981 of the Be-type star 11 Cam with the aid of a two-metre telescope. Six spectrograms were obtained for the wavelengths 3500-5000 \AA . The most interesting absorption lines of the star were those of the Balmer series, in which is observed a significant emission through the shell of the star. The spectral characteristics of the star were determined, and the Balmer decrements as calculated from the observational

data were compared with the theoretical values. Changes in the contours of the spectral lines of H_α , H_β and H_γ during the course of a night and a 24-hour period were recorded. (7 refs.) A.J.B.

64490 Nova Serpentis 1983. T.Iijima, S.Ortolani, L.Rosino. *I.A.U. Circ. (USA)*, no.3790, 1 pp. (7 April 1983).

The authors report that spectra of Nova Serpentis 1983 covering the period 1983 March 3 to 19 show broad emission features of H, He I, He II 468.6 nm, and N III 464.0 nm; and nebular forbidden lines of [O III] at 500.6 nm and 495.9 nm. The expansion velocity from the total halfwidth of the H emission bands is 4050 km/s. The H and He emission bands are formed by two broad symmetric features with a peak separation of about 5400 km/s, and a central narrower double-peaked emission with the components separated by 530 km/s. The nova has already entered the nebular stage and the excitation is increasing: in the last spectra obtained on 1983 March 19, He II 468.6 nm is stronger than H β . (no refs.)

64491 Herbig-Haro 57. J.A.Frogel, J.A.Graham.

I.A.U. Circ. (USA), no.3792, 1 pp. (19 April 1983).

It is reported that the recently-discovered starlike object in HH 57 is a strong infrared source which radiates most of its power longward of 5 μ m. Infrared photometry of the object between 2.2 μ m and 20.0 μ m is reported. At 10 μ m wavelength the emission appears to originate in a region with a diameter <2 arcsec centred on the stellar source, which is identified with IRS 8 of Reipurth and Wamsteker (1982). The infrared colours of the object are similar to those of FU Orionis and V1057 Cygni. There is no obvious emission or absorption feature in the 10- μ m window. Images of the object obtained under conditions of sub-arcsecond seeing confirm its stellar nature. A low-resolution spectrogram shows a red and essentially featureless energy distribution. (1 ref.)

64492 V1343 Aquilae. R.C.Lamb, J.C.Ling, W.A.Mahoney, G.R.Riegler, W.A.Wheaton, A.S.Jacobson.

I.A.U. Circ. (USA), no.3793, 1 pp. (19 April 1983).

The authors report evidence for γ -ray line emission from the region surrounding V1343 Aquilae (=SS 433), as a result of observations by the HEAO-3 satellite between October 10 and November 5, 1979, and from 4 to 25 April, 1980. Two γ -ray lines are observed, at energies of 1.5 MeV and 1.2 MeV. The average intensities of the two features are 15 ± 3 photons/ m^2/s for the 1.5 MeV line, and 11 ± 2 photons/ m^2/s for the 1.2 MeV line; both features vary by a factor of about five on a time scale of days. The combined power in the lines is about 2×10^{40} J/s. The lines varied by about 40 keV over 20 days during the 1979 observations. These spectral features are explained as blueshifted and redshifted components of the 1.369 MeV line from nuclear de-excitation of ^{24}Mg to its ground state. The energy variation is consistent with the kinematic model used to interpret the optical and radio phenomena previously observed in SS 433. (no refs.)

64493 KR Aurigae. J.Bortle.

I.A.U. Circ. (USA), no.3793, 1 pp. (19 April 1983).

The author reports visual magnitude estimates for the cataclysmic binary star KR Aurigae for the epochs 1983 March 21 and April 2; the star is at about magnitude 13.5. (no refs.)

97.60B Supernovae

64494 Supernovae. H.Kosai, Y.Kozai, R.Evans, G.Thompson, R.W.Argyle.

I.A.U. Circ. (USA), no.3789, 1 pp. (7 April 1983).

Reports the discovery on 1983 April 4 of a 13th-magnitude supernova 10" west and 20" south of the nucleus of NGC 4753. The precise position of the supernova is $\alpha=12^h49^m47.23^s$, $\delta=-00^\circ55'54.2''$ (equinox 1950.0). In addition, a precise position is given for the supernova in NGC 3044 (c.f. IAU 3787), namely $\alpha=09^h51^m08.05^s$, $\delta=+01^\circ48'45.2''$ (equinox 1950.0). The supernova is 29" east and 11" south of the nucleus of NGC 3044; its photographic magnitude on 1983 March 31 was about 15. (1 ref.)

64495 Supernovae. J.Maza, R.W.Argyle.

I.A.U. Circ. (USA), no.3792, 1 pp. (19 April 1983).

Reports the discovery on 1983 April 14 of a possible 18th-magnitude supernova 57" east and 10" south of the nucleus of the galaxy NGC 7083 ($\alpha=21^h31.8^m$, $\delta=-64^\circ07'$, equinox 1950.0), in Indus. In addition a precise position is reported for the supernova in NGC 4753, namely $\alpha=12^h49^m46.91^s$, $\delta=-00^\circ55'55.0''$ (equinox 1950.0); the photographic magnitude of the supernova on 1983 April 12 was 13.3. (no refs.)

64496 Supernovae. II. The aftermath. V.Trimble (Dept. of Phys., Univ. of California, Irvine, CA, USA).

Rev. Mod. Phys. (USA), vol.55, no.2, p.511-63 (April 1983).

Part I see *ibid.*, vol.54, no.4, p.1183-224 (1982) explored stellar evolution leading up to supernovae and observations and models of the events themselves. Part II addresses the aftermath: supernova remnants, products, and by-products, including nucleosynthesis, and the future of supernova research. Some of the important questions are: (1) How close is the association among supernova events, pulsar production, and remnant production? (2) Where does most of the energy from neutron star formation go? and (3) How do supernovae interact with the rest of the Universe, for instance in heating and stirring the interstellar medium, accelerating cosmic rays, and triggering or inhibiting star formation. (760 refs.)

The effects of sudden mass loss and a random kick velocity produced in a supernova explosion on the dynamics of a binary star of arbitrary orbital eccentricity. Applications to X-ray binaries and to the binary pulsars See Entry 64508

97.60G Pulsars

64497 On the origin of the recently discovered ultra-rapid pulsar. V.Radhakrishnan, G.Srinivasan (Raman Res. Inst., Bangalore, India).

Curr. Sci. (India), vol.51, no.23, p.1096-9 (5 Dec. 1982).

The rapid rotation rate of ~ 1.5 ms of the newly discovered pulsar PSR 1937+21 is attributed to spin-up in a long-lived mass transfer binary. Such a history leads to a prediction of a very low period derivative $\sim 6 \times 10^{-19}$ ss^{-1} for this pulsar. The gravitational radiation from this pulsar is expected to be negligible. (17 refs.)

64498 Loss of angular momentum in a binary system due to collisionless particles as monopoles or gravitinos: does it exceed the gravitational radiation emission in the binary system PSR 1913+16? D.Fargion (Istituto di Fisica, Univ. di Roma, Roma, Italy).

Lett. Nuovo Cimento (Italy), vol.36, ser.2, no.14, p.449-52 (2 April 1983).

The authors consider the gravitational drag for a massive object moving in the (almost) collisionless fluid made by magnetic monopoles: the drag mechanism may be relevant in the loss of angular momentum in binary systems; in particular for a known binary system in our Galaxy associated with pulsar PSR 1913+16 they show that a monopole number density larger than 10^{-7} cm^{-3} (as the expected solar one) may induce an energy loss comparable or even larger than the one in debt to the gravitational radiation of the system. (16 refs.)

64499 High-resolution X-ray and radio maps of the millisecond pulsar. R.H.Becker (Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA), D.J.Helfand.

Nature (GB), vol.302, no.5910, p.688-90 (21 April 1983).

Radioastronomical and X-ray observations of this object are presented. A stringent upper limit is placed on any X-ray emission from the pulsar. High-resolution multi-frequency radio maps of the region which provide the best available pulsar position are presented. The authors argue against any connection between the pulsar and the nearby extended radio emission region and comment on the constraints which the X-ray data place on the nature of the this object. (10 refs.)

64500 Polarimetry of the millisecond pulsar. D.R.Stinebring (Nat. Radio Astron. Obs., Charlottesville, VA, USA).

Nature (GB), vol.302, no.5910, p.690-2 (21 April 1983).

The millisecond pulsar PSR 1937+21 might be expected to have unique waveform and polarization properties as a result of its remarkably short period and small spin-down rate. The author presents polarization observations of the main pulse and interpulse at 1415 and 2380 MHz that have higher time resolution than previously available. The main pulse depolarizes substantially over this frequency range whereas the interpulse polarization almost doubles. There is evidence that orthogonally polarized radiation is present on the leading edge of the main pulse and the trailing edge of the interpulse and that it accounts for the $\sim 90^\circ$ difference in position angle between the main pulse and interpulse. The interpulse decreases in intensity relative to the main pulse as f^{-1} , indicating (if the trend continues to lower frequency) that the high frequency interpulse dominates the main pulse below ~ 700 MHz. The main pulse is found to consist of two closely spaced components. (11 refs.)

64501 Prediction of pulsar glitch frequency based on the hard superfluid model. N.Itoh (Dept. of Phys., Sophia Univ., Tokyo, Japan).

Prog. Theor. Phys. (Japan), vol.69, no.1, p.338-40 (Jan. 1983).

Prediction of the pulsar glitch frequency is made on the basis of the hard superfluid model for pulsar glitches. It is likely that further superglitches will be observed in some of the most rapidly decelerating pulsars in the near future. (12 refs.)

64502 Plasmas in superstrong pulsar fields. H.Herold, H.Ruder (Lehrstuhl für Theoretische Astrophys., Univ. Tübingen, Tübingen, Germany).

Phys. Scr. (Sweden), vol.T2, no.1, p.206-14 (1982). (1982 International Conference on Plasma Physics, Göteborg, Sweden, 9-15 June 1982).

The observed emission of both radio and X-ray pulsars originates from plasmas under very extreme conditions. The common property is the occurrence of huge magnetic fields of the order of 10^8 T. Concerning the complex of problems associated with radio pulsars, the authors investigate the equations governing the magnetosphere of an aligned rotator and discuss possible structures of self-consistent solutions, and deal with the accretion columns of X-ray pulsars, especially with the electron-photon interactions in hot strongly magnetized plasmas. (34 refs.)

64503 Some nonlinear mechanisms of pulsar emission. J.G.Lominadze, A.D.Pataraya (Abastumani Astrophys. Obs., Acad. of Sci., Tbilisi, Georgian SSR).

Phys. Scr. (Sweden), vol.T2, no.1, p.215-22 (1982). (1982 International Conference on Plasma Physics, Göteborg, Sweden, 9-15 June 1982).

Gives results obtained from the theory of linear and nonlinear waves propagating in relativistic electron-positron plasma with a strong external magnetic field. The possible application of these results to explain the radiation mechanism in pulsars is discussed. The nonlinear equation describing the behaviour of the amplitude profile of the waves, propagating at an angle to the external magnetic field, is studied in the low frequency region. The radiation intensity of a pulsar is calculated in terms of soliton solution of the equation. The results obtained are compared with the experimental data. Two mechanisms of formation of bunches along the magnetic field are considered. (51 refs.)

97.60J Neutron stars

64504 Equilibrium composition and neutrino emissivity of interacting quark matter in neutron stars. R.C.Duncan, S.I.Shapiro, I.Wasserman (Center for Radiophysics & Space Res., Cornell Univ., Ithaca, NY, USA).

Astrophys. J. (USA), vol.267, no.1, pt.1, p.358-70 (1 April 1983).

Shows that a detailed treatment of the equilibrium composition of a quark liquid is crucial to the accurate evaluation of its neutrino emissivity. When massive s-quarks are present in cold quark matter, the electron fraction Y_e vanishes above a finite baryon density n_{ex} . This results in a vanishing total

emissivity at high densities, to lowest order in kT . The phase transition at which s-quarks first appear is also studied in detail. The dependences of the composition and emissivity of quark matter on the strange quark mass m_s and QCD coupling constant (at neutron star densities) α_s are calculated. The implications for neutron star cooling calculations are discussed. (31 refs.)

64505 Effect of the neutron 3P_2 pairing on the π^0 condensation threshold in neutron star matter. F.Asai (Dept. of Phys., Osaka Univ., Osaka, Japan). *Prog. Theor. Phys. (Japan)*, vol.69, no.1, p.348-50 (Jan. 1983). Phase transition of neutron star matter into a π^0 condensate is suppressed by the neutron 3P_2 pairing. In practice this suppression brings about no significant change in the condensation threshold predicted so far. (7 refs.)

64506 Temperature effect on the dynamics of neutron stars with pion-condensation. Yu.A.Berezin, B.G.Mukanova, M.N.Fedoruk. *Pis'ma v Astron. Zh. (USSR)*, vol.9, no.2, p.116-19 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*. Taking into account the finite temperature of the neutron star with pion-condensation, results in increasing the star radius, and decreasing the core mass, core radius, central density and density discontinuity. 97.80 BINARY AND MULTIPLE STARS

(inc. extrasolar planetary systems)

64507 Rapid rotation and stellar activity in the triple system HD 165590. R.A.Stern (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA), A.Skumanich.

Astrophys. J. (USA), vol.267, no.1, pt.1, p.232-8 (1 April 1983). Reports X-ray and ultraviolet observations of the spectroscopic and visual binary HD 165590. The spectroscopic binary component has a period of 0.88^d and a near-solar spectral type. A substantial soft X-ray flux is predicted for HD 165590. This prediction is confirmed by observing an X-ray luminosity of $10^{30.6}$ ergs s^{-1} for the system. No obvious periodicities of less than 0.5^d are present in the X-ray data, although stochastic variability is present. Observations with the International Ultraviolet Explorer of transition region emission lines are consistent with the X-ray data and reveal $\sim 50\%$ variability on the time scale of days. Comparison of the results with X-ray observations of other late F and G stars demonstrates that rotation-activity scaling relations are useful as gross predictors of X-ray emission. (47 refs.)

64508 The effects of sudden mass loss and a random kick velocity produced in a supernova explosion on the dynamics of a binary star of arbitrary orbital eccentricity. Applications to X-ray binaries and to the binary pulsars. J.G.Hills (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA). *Astrophys. J. (USA)*, vol.267, no.1, pt.1, p.322-33 (1 April 1983). Calculates the probability of survival of binaries and the changes in orbital elements of those binaries that do survive as a function of the mass loss experienced in the supernova explosion and of the kick velocity given the neutron star (or black hole). This is done for the general case where the preexplosion orbit can have an arbitrary eccentricity. (27 refs.)

64509 Infrared photometry of the RS CVn binaries. I. TY Pyxidis. E.Antonopoulou (Royal Obs. of Edinburgh, Edinburgh, Scotland). *Astron. & Astrophys. (Germany)*, vol.120, no.1, pt.1, p.85-8 (April 1983). Infrared light curves of the RS CVn-type binary TY Pyxidis (HD 71737) in J, H, and K have been obtained and nearly sinusoidal light variations outside eclipse have been detected, similar to those observed in other RS CVn systems. The period of these variations is approximately equal to the orbital period of the system and their amplitude decreases with increasing wavelength. Irregular light variations have also been observed. There is no conspicuous infrared excess attributable to circumstellar emission. (11 refs.)

64510 The combined effect of mass loss and overshooting. III. Evolutionary scenarios for massive close binaries. C.Doom, J.P.de Greve (Astrophys. Inst., Vrije Univ. Brussel, Brussel, Belgium).

Astron. & Astrophys. (Germany), vol.120, no.1, pt.1, p.97-105 (April 1983). For pt.II see *ibid.*, vol.116, no.2, p.308-11 (1982). The evolution of massive close binaries is revised by taking into account overshooting from convective cores. Nine different evolutionary scenarios are presented, resulting from the introduction of an Of phase for each component. The theoretical results are compared to observations of Wolf-Rayet binaries and X-ray binaries. It is found that X-ray binaries originate from the lower mass Wolf-Rayet binaries. The existence of WR+Of stars is predicted. (46 refs.)

64511 The early B-type eclipsing binary FZ CMa (HD 52942): a massive triple system. A.F.J.Moffat (Astron. Inst., Univ. Bonn, Bonn, Germany), N.Vogt, L.P.R.Vaz, B.Gronbech.

Astron. & Astrophys. (Germany), vol.120, no.2, pt.2, p.278-86 (April 1983). New photoelectric observations in *uvby* are used to construct a light curve of this double-line eclipsing system in which two components (A,B), each of type B 2.5 IV-V, revolve in a 1.27 d orbit. Modelling of the mean light curve yields: orbital inclination $i=88^\circ$; effective temperature $T_B \approx 20,600K$ ($T_A \approx 22,000K$ assumed); stellar radii $R_A \approx R_B \approx 0.28 a$ (a is the mean orbital separation) $\approx 3.1 R_\odot$; visual luminosity ratio $L_B/L_A \approx 0.89$. Hence, A and B are nearly equal, with the primary (A) being slightly hotter and more luminous. However, a consistent solution of the light curve could be achieved only if a third body, denoted X, contributes 43% to the total flux in *u,b*, *y* and 36% in *v*. The third body manifests itself independently by periodic modulation in the times of minimum light, although it is not seen directly in the spectrum. Analysis of the 23 observed-minus-predicted times of minima, spread over 8 yr, leads to $P_X = 537$ d, $e_X = 0.56$ and $A_{AB} \sin i_X = 1.94$ AU. Photographic coude spectroscopy of the A+B components yields the masses $m_A \approx m_B \approx 5.3 M_\odot$ and orbital radii $a_A \approx a_B \approx 5.5 R_\odot$. The effective Roche-lobe radii are $\approx 4.1 R_\odot$ for each star, implying that the present A+B system is well detached. (26 refs.)

64512 The curious case of zeta Aurigae. D.Darling (Univ. of Manchester, Manchester, England).

Astronomy (USA), vol.11, no.3, p.66-70 (March 1983). Presents a general discussion on the nature of zeta Aurigae. The positions of the components on the HR diagram are discussed. Various models for the available observations are briefly discussed. (no refs.)

64513 Light curves of four southern bright hitherto unknown eclipsing binaries. C.Waelkens (Obs. de Geneve, Geneve, Switzerland), F.Rufener. *Astron. & Astrophys. Suppl. Ser. (France)*, vol.52, no.1, p.13-20 (April 1983). Photometric light curves are presented for four bright southern eclipsing binaries, that were not yet known as variable stars or for which the variability was not yet understood. HR 7464 is a probable Am star in an eclipsing binary; the known single-lined spectroscopic binary HR 7422 shows two similar eclipses, so spectra with a high resolution should reveal the secondary too; both HR 6621 and HR 5034 are early-type close binaries for which there is evidence for variations of the orbital period. In particular, HR 5034 is an evolved B3 star with an orbital period of only 1.278 day, so it could be near a contact configuration. (13 refs.)

64514 HD 85037: probable new eclipsing variable. P.Renson (Univ. de Liege, Liege, Belgium).

Inf. Bull. Variable Stars (Hungary), no.2298, p.1-3 (18 March 1983). In French.

In the course of photometric observations of the Ap star HD 83368 during December 1975 and February 1977, it was discovered that one of the comparison stars, namely the Ap star HD 85037 (=GC 13508= CoD-49°4692; spectral type A0p), was itself variable. The author describes the results of *uvby* photometry of HD 85037, and presents a *y*-band light curve. The probable period of the light variation is 1.346 days. The origin adopted for the phase is the epoch JD 2442763.00. Phase zero corresponds to a sharp minimum ($\Delta m \sim 0.09$ mag.) indicated by two of the measurements which may be due to an eclipse; there is also a possible secondary minimum at about phase 0.7. In addition there is a general small-amplitude light variation ($\Delta m \sim 0.02$ mag.) with a single maximum at about phase 0.4. The implications of these observations are discussed. (3 refs.)

64515 Spectroscopic binary orbits from photoelectric radial velocities. XLIX. HD 80655. R.F.Griffin (Cambridge Obs., Cambridge, England).

Observatory (GB), vol.103, no.1053, p.56-7 (April 1983). For pt.XLVIII see *ibid.*, vol.103, no.1052, p.17-20 (1983). The author reports radial velocity measurements and orbital elements for the M-type giant star HD 80655. (4 refs.)

64516 Radiation processes in stellar X-ray sources. S.Hayakawa (Dept. of Astrophys., Nagoya, Japan).

Phys. Scr. (Sweden), vol.T2, no.1, p.167-76 (1982). (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

Mechanisms of X-ray emission from white dwarfs and neutron stars are reviewed by paying attention to radiative transfer processes. The values of plasma parameters concerned are summarized. Comptonization processes in non-magnetic plasmas are discussed. Effects of magnetic fields on radiative transfer are considered with regard to the energy dependent pulse profiles and the spectra observed for X-ray pulsars. An observational result of the super-high luminosities of X-ray bursts in excess of the Eddington limits are presented. Difficulties in accounting for such events if the bursts are triggered by nuclear flash are mentioned. (18 refs.)

64517 Is the rapidly repetitive radiation from X-ray sources due to explosive three wave interaction? H.Wilhelmsson, L.-O.Pekkari, D.Andersson (Inst. for Electromagnetic Field Theory, Chalmers Univ. of Technol., Goteborg, Sweden).

Phys. Scr. (Sweden), vol.T2, no.1, p.271-2 (1982). (1982 International Conference on Plasma Physics, Goteborg, Sweden, 9-15 June 1982).

Several features of the rapidly repetitive radiation from compact X-ray sources are suggestive of the explosive three-wave interaction as generating mechanism. The possibility of such an explanation is discussed and it is shown that this could account for the observed energy range of the radiation as well as the observed variable burst patterns. (8 refs.)

64518 Angular distribution of radiation from the plasma of X-ray pulsars taking into account vacuum polarization by magnetic fields. A.D.Kaminker, G.G.Pavlov, Yu.A.Shibanov.

Pis'ma v Astron. Zh. (USSR), vol.9, no.2, p.108-15 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*

Angular distributions of X-ray radiation from a homogeneous, optically thick and strongly magnetized plasma are calculated for a wide range of photon energies and plasma number densities appropriate for the radiating regions of X-ray pulsars. Angular distributions are shown to be significantly affected by vacuum polarization. It is noted that under certain conditions there are strong changes of the beam width. (17 refs.)

98.20 STELLAR CLUSTERS AND ASSOCIATIONS

64519 Investigation of the star cluster NGC 6913 (M29). E.A.Herts. *Astrometriya & Astrofiz. (USSR)*, no.47, p.58-61 (1982). In Russian. The visible density distribution is plotted using probable members of NGC 6913, selected on the basis of their proper motions. The cluster is shown to consist of the nucleus with a $5'$ radius and a corona with $32'$ radius. The photometric distance (1200 pc) and the lower limit to the cluster mass ($1 \times 10^3 M_\odot$) are estimated. (6 refs.)

64520 An investigation of the heavily reddened young open cluster Tr 27 on the Walraven photometric system. R.Bakker, P.S.The (Astron. Inst., Univ. of Amsterdam, Amsterdam, Netherlands). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.52, no.1, p.27-36 (April 1983). The light of many stars in Tr 27 is strongly attenuated by a foreground dark cloud. Employing *UBV*, *RI* and *JHKLM* data of 3 stars with known spectral types, the ratio of total to selective extinction of the foreground dark cloud was determined by means of the colour-difference method. The authors use this value and photometric data on the Walraven system for the determination of the distance of Tr 27. From the turn-off point of the cluster main sequence the age of the cluster is estimated. The absolute magnitude of several interesting members of the cluster is discussed. (32 refs.)

64521 The globular cluster NGC 6544. G.Alcaino (Inst. Isaac Newton, Ministerio de Educacion de Chile, Santiago, Chile). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.52, no.1, p.105-13 (April 1983).

A color magnitude diagram (CMD) for the globular cluster NGC 6544 obtained from 164 stars measured photographically. The brighter part, which includes the horizontal branch, calibrated from a photoelectric sequence of 20 stars to a limiting magnitude $V=16.6$; and a fewer fainter stars, with a Pickering-Racine wedge. The CMD suggests 'medium metallicity' traits, and the deduced reddening of $E(B-V)=0.70$, places the object at 2.9 kpc from the Sun, 0.1 kpc from the galactic plane and 6.1 kpc from the galactic center. The location of most of the very reddened stars in the NW region, suggests the presence of differential reddening in the face of the cluster. (12 refs.)

64522 Observed radii and structural parameters of clusters in the SMC. H. E.Kontizas (Astron. Inst., Nat. Obs. of Athens, Athens, Greece), M.Kontizas. *Astron. & Astrophys. Suppl. Ser. (France)*, vol.52, no.1, p.143-59 (April 1983).

For pt.1 see *ibid.*, vol.49, no.1, p.1-12 (1982). The surface density profiles and the tidal radii have been found for 23 star clusters in the SMC, by means of star counts. The core radii concentration parameters were derived by fitting theoretical models. The masses of the 'red' and 'blue' clusters, compared to those of globular clusters of our own Galaxy, were found to be systematically 10 times less massive. The 'blue' clusters, seem to have dynamical behaviour similar to the galactic globulars. (10 refs.)

98.40 INTERSTELLAR MATTER; AND NEBULAE

64523 The compact H II region S235A. Observations and interpretation. G.Olofsson (Stockholm Obs., Saltsjobaden, Sweden).

Astron. & Astrophys. (Germany), vol.120, no.1, pt.1, p.1-5 (April 1983). The compact H II region Sharpless 235A has been mapped in the wavelength range 1.6-20 μm . The infrared radiation peaks on a stellar object which has previously been identified as the ionizing source of the nebula. The near infrared radiation exhibits roughly the same spatial distribution as the radio continuum but is an order of magnitude brighter than the expected gas emission. This is interpreted as evidence for a clumpy or filamentary structure throughout the ionized region. A new infrared source was discovered two minutes of arc north of Sharpless 235A. It coincides with a faint nebulosity proposed to be a Herbig-Haro object. (15 refs.)

64524 The ratio of deuterium to hydrogen in interstellar space. V. The line of sight to ϵ Persei. A.Vidal-Madjar, C.Laurent, C.Gry, P.Bruston, R.Ferlet (Lab. de Phys. Stellaire et Planetaire, CNRS, Verrieres-le-Buisson, France), D.G.York.

Astron. & Astrophys. (Germany), vol.120, no.1, pt.1, p.58-62 (April 1983). For pt.IV see *Astrophys. J.*, vol.229, no.3, pt.1, p.923-41 (1979). The study of deuterium in the direction of ϵ Per has revealed a time variation of the observed D I absorption feature. To explain this variation it is supposed that H I material is present in the stellar wind producing the narrow absorption features observed on the blue wing of the Lyman lines. In consequence it appears that deuterium absorption lines may sometimes be contaminated by high-velocity H I present in stellar winds. Reviewing the previously published deuterium abundance determinations, it is shown that a correlation seems to exist between the stellar luminosity class and the D/H values, the lowest D/H value corresponding to the more evolved stars. The conclusion is that the local interstellar deuterium abundance is more probably of the order of 5×10^{-6} rather than 2×10^{-5} as previously thought. (42 refs.)

64525 A high-latitude H I cloud with optical emission. W.Georgik, U.Mebold, K.Reif, P.M.W.Kalberla, L.Velden (Radioastron. Inst., Univ. Bonn, Bonn, Germany).

Astron. & Astrophys. (Germany), vol.120, no.1, pt.1, p.63-73 (April 1983). A high latitude H I cloud ($\approx 91^\circ$, $b \approx 38^\circ$) extended over several degrees on the sky with brightness temperature $T_B \approx 20\text{K}$, velocity dispersion $\approx 1.0\text{ km s}^{-1}$ and a centre velocity $v_{LSR} \approx -21\text{ km s}^{-1}$, has been observed with the 100 m telescope. The cloud is found to be in detailed positional agreement with a faint diffuse nebula visible on the red and the blue prints of the Palomar Observatory Sky Survey. Estimates of the extinction in the nebula from star

counts indicate that the ratio of H I column density to extinction is about a factor of 10 smaller than the standard value found from UV-observations. (14 refs.)

64526 Diameter distribution and Σ -D relation of SNRs in M31 and in M33. E.M.Berkhuijsen (Max-Planck-Inst. fur Radioastron., Bonn, Germany). *Astron. & Astrophys. (Germany)*, vol.120, no.1, pt.1, p.147-9 (April 1983). The $N(<D)$ -D relations for SNRs in M31 and in M33 are much flatter than expected for SNRs in the phase of adiabatic expansion. The Σ -D relations are consistent with the relation for SNRs in the Galaxy. (18 refs.)

64527 Magnetic alignment of interstellar dust grains for dominating magnetic effects. P.Cugnon (Obs. Royal de Belgique, Brussels, Belgium). *Astron. & Astrophys. (Germany)*, vol.120, no.1, pt.1, p.156-63 (April 1983). Studies the asymptotic behaviour of the degree of alignment of interstellar dust grains, when magnetic effects become greater than collisional effects. Two different shapes, spheroids and square prisms, have been considered, for different elongations and different values of the grain/gas temperature ratio. (9 refs.)

64528 The Crab Nebula. I. Photoionization of a bright filament. D.Pequignot (Dept. d'Astrophys. Fondamentale, Obs. de Meudon, Meudon, France), M.Dennefeld.

Astron. & Astrophys. (Germany), vol.120, no.2, pt.2, p.249-62 (April 1983). Stationary photoionization models are presented for a bright filament of the Crab Nebula. Charge-exchange reactions and low-temperature di-electronic recombinations are taken into account. In a first series of models, the slope of the ionizing continuum is 0.5 in the ultraviolet range and joins smoothly to the 1.1 X-ray slope around 0.5 keV. It is demonstrated that constant density and constant thermal pressure models are definitely unable to explain the observations. Satisfactory models accounting for virtually all available lines from UV to IR can be obtained if the thermal pressure in the bulk of the filament is about twice that of the outer parts; the high-excitation lines are predicted to arise from an extended zone of several arcseconds. It is confirmed that the filament should be cylinder-like rather than sheet-like. It is found that not only helium but heavy elements as well as overabundant relative to H: the abundances per nucleon are quite typical of Population I so that the initial mass of the precursor of the supernova is now allowed to be large. (51 refs.)

64529 Detection of HCO^+ and HCN absorption towards three galactic H II-regions. L.-A.Nyman (Onsala Space Obs., Onsala, Sweden).

Astron. & Astrophys. (Germany), vol.120, no.2, pt.2, p.307-12 (April 1983). HCO^+ and HCN absorption have been detected towards W49, W51, and DR 21 and a detection limit has been placed on HNC absorption towards W49. The velocities of the lines imply absorbing gas near the sources as well as in diffuse spiral arm clouds. The observations suggest that HCO^+ and HCN are abundant in low density clouds. Self absorption features and absorption in gas close to the sources show that molecular clouds can be surrounded by low density, absorbing gas, which may seriously distort the emission spectra used to derive molecular cloud parameters. (39 refs.)

64530 Investigation of the region around the emission nebula IC 1848. V.I.Voroshilov, M.D.Metreveli.

Astrometriya & Astrofiz. (USSR), no.47, p.3-10 (1982). In Russian. The B, V photometry and spectral classification of 870 O-B-A stars are used to investigate the emission nebula IC 1848. Outside the nebula the O-B2 star density is three times less than that inside the nebula. The nebula distance, 2160 pc, is evaluated from observations of the stars making a contribution to the ionization. (12 refs.)

64531 Investigation of the region around the emission nebula NGC 1499. N.B.Kalandadze, V.I.Voroshilov.

Astrometriya & Astrofiz. (USSR), no.47, p.10-16 (1982). In Russian. The B, V photometry and spectral classification near 400 O-B-A stars were used to investigate the region around the emission nebula NGC 1499. It is found that at distances 1350-1800 pc a complex of dust clouds is situated outside the main absorbing layer. The density of the O-B-A stars in this region is low. The radio flux of NGC 1499 is in agreement with the flux of ionizing radiation of ξ Per (O7 V). The photometric and trigonometric parallaxes of ξ Per give the distance of NGC 1499 as 490 pc. (12 refs.)

64532 On interstellar light absorption in the Galaxy. E.A.Nazarov, M.F.Khodychikh.

Astrometriya & Astrofiz. (USSR), no.48, p.33-6 (1983). In Russian. Mean galactic absorption is determined from the galactic latitude distribution of quasars and from the dependence of brightness of the statistically brightest objects in the QSO groups on the galactic latitude. The weighted mean of the absorption is determined in the direction of the galactic pole. (8 refs.)

64533 Linear polarization observations in selected celestial zones—The anticentre region. J.P.Vallee (Inst. Herzberg d'Astrophys., Conseil Nat. de Recherches du Canada, Ottawa, Ontario, Canada).

Astron. & Astrophys. Suppl. Ser. (France), vol.52, no.1, p.125-9 (April 1983). Observations of linear polarization have been made at a wavelength of 2.83 cm for several dozens of extragalactic radio sources, in a restricted celestial angular zone towards the galactic anticentre region. This program complements previous all-sky surveys of stronger sources, in preparation for later analyses of localized polarization effects from specific zones of our Galaxy. (7 refs.)

64534 On the turbulent motions revealed in the Sagittarius arm by interstellar-line studies. C.O.Lousto, J.C.Muzzio (Obs. Astronomico, Univ. Nacional de La Plata, La Plata, Argentina).

Observatory (GB), vol.103, no.1053, p.53-5 (April 1983). The authors use published photometric and spectroscopic results to show that the turbulent motions in the Sagittarius arm invoked to explain the interstellar-line observations for $l > 340^\circ$ extend to $l < 340^\circ$ as well. (13 refs.)

64535 Far-infrared rotational transition lines of the interstellar water vapor. H.Shibai (Inst. of Space & Astronaut. Sci., Tokyo, Japan), T.Mai-hara.

Prog. Theor. Phys. (Japan), vol.69, no.1, p.77-88 (Jan. 1983). Far-infrared rotational transition lines of H_2O vapor are calculated to predict the line intensities under the condition of interstellar molecular clouds. Fractional populations for ortho- and para- H_2O molecules are obtained by solving a statistical equilibrium equation in which the authors employ recent data of H_2O - H_2 collisional excitation coefficients. Results are shown by presenting excitation temperature and optical depth for representative transition lines. Predicted intensities of several far-infrared lines are also demonstrated for a simplified cloud model. (13 refs.)

64536 Solid and gaseous carbon allotropes in ultrahigh vacuum at 3K. C.Reale (Inst. di Fisica, Politecnico di Milan, Milan, Italy).

Port. Phys. (Portugal), vol.13, no.3-4, p.193-201 (1982). In ultrahigh vacuum at 3K (the ordinary condition of the interstellar matter) carbon can be quenched-crystallized in Al-type and A3-type phases and may also become a gas with diatomic $\text{C}\equiv\text{C}$ molecules, similar to the $\text{N}\equiv\text{N}$,

O=O and H-H molecules of the three other elements that give rise to life. (7 refs.)

98.50 THE GALAXY, EXTRAGALACTIC OBJECTS AND SYSTEMS

- 64537 The formation of disc galaxies. B.J.T.Jones (LAM Obs. de Meudon, Meudon, France), R.F.G.Wyse. *Astron. & Astrophys. (Germany)*, vol.120, no.2, pt.2, p.165-80 (April 1983). The authors describe a model for the formation of disc galaxies in which the thick disc component and central bulge are the first luminous systems to form in a non-spherical massive dark halo. The thick disc that forms is not in centrifugal equilibrium except in the central parts (the bulge) and subsequent dynamical processes give it the exponential nature of the density distribution seen now. The thin disc forms from the gas lost by stellar evolution in the thick disc and accretion of primordial gas and in this way the model provides an explanation for both the thinness of this component and the apparent universality of its exponential-type profile. The authors investigate the collapse and fragmentation of gas in non-spherical halo potentials and show that it is highly likely that a hot gaseous disc is formed, collapse to a plane occurring before angular momentum becomes important. Further analysis leads to the conclusion that the hot disc will cool and form stars on a timescale shorter than the halo radial dynamical time. This means that a hot stellar system—a thick disc—is formed. (107 refs.)
- 64538 Roche's limit in a galaxy. II. The effects of rotation. H.Robe (Inst. d'Astrophys., Cointe-Ougree, Belgium). *Astron. & Astrophys. (Germany)*, vol.120, no.2, pt.2, p.215-18 (April 1983). For pt.1 see *ibid.*, vol.97, p.182-4 (1981). The tidal effects exerted by the central part of a galaxy on a galactic cloud orbiting at a distance d from the center are examined in the presence of the gravitational effect of the galactic halo and of galactic rotation. Rotation increases somewhat the Roche limit outside which equilibrium exists. Nevertheless, the halo significantly reduces the tidal effects, especially so if the galactic concentration is low. (4 refs.)
- 64539 The origin of the nonthermal radio emission in normal disk galaxies. R.Kennicutt (Dept. of Astron., Univ. of Minnesota, Minneapolis, MN, USA). *Astron. & Astrophys. (Germany)*, vol.120, no.2, pt.2, p.219-22 (April 1983). A strong correlation exists between the total nonthermal radio flux of a spiral galaxy and its integrated H α emission line flux. The correlation is much tighter than the corresponding relationship between total radio flux and the integrated optical magnitude of a galaxy. The most straightforward interpretation of this result is that the relativistic electrons responsible for the nonthermal radio emission are produced primarily by massive young stars, not by the old disk population. (18 refs.)
- 64540 Kinematics and structure of the Galaxy at high galactic latitude. N.V.Kharchenko. *Astrosmetriya & Astrofiz. (USSR)*, no.47, p.49-58 (1982). In Russian. Using the absolute proper motions of stars in 21 selected areas, the kinematic characteristics of stellar groups in the main meridional section of the Galaxy are obtained. For these stellar groups the empirical expressions for the change of radial velocities of rotation around the galactic z-axis are found as functions of distance from the galactic plane. Relative stellar abundances of the intermediate and spherical subsystems at $z=0-1.5$ kpc as well as the space densities of late-type giants at $z=1-2$ kpc are calculated. (22 refs.)
- 64541 The gas distribution in the central region of the Galaxy. IV. A survey of neutral hydrogen in the region $349^{\circ} \leq l \leq 13^{\circ}$, $-10^{\circ} \leq b \leq 10^{\circ}$, $|\mu| \leq 350$ km.s⁻¹. W.B.Burton, H.S.Liszt (Sterrewacht, Huygens Lab., Leiden, Netherlands). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.52, no.1, p.63-103 (April 1983). For pt.III see *Astrophys. J.*, vol.236, no.3, pt.1, p.779-97 (1980). Presents 21-cm observations of neutral hydrogen emission from the core of the Galaxy made over a period of several years with the 140-foot telescope of the National Radio Astronomy Observatory. The material covers the region $349^{\circ} \leq l \leq 13^{\circ}$, $-10^{\circ} \leq b \leq 10^{\circ}$, at intervals of one-half degree in both l and b . Each reduced spectrum covers the velocity range $|\mu| < 350$ km.s⁻¹ at a kinematic resolution of 5.5 km.s⁻¹ to an r.m.s. sensitivity limit ≥ 0.02 K. The data are displayed in three sets of representative maps drawn in latitude-longitude, latitude-velocity, and longitude-velocity coordinates. Anomalous features representing material in the galactic core are labelled in the appropriate figures. The authors give some summarizing taxonomic remarks concerning these anomalies. (127 refs.)

- 64542 Dissipative structures in galaxies. G.Bodifée, C.de Loore (Vrije Univ. Brussels, Brussels, Belgium). *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.1, p.71-4 (10 Jan. 1983). In French. It is suggested that the morphological structures of disk constituents of spiral galaxies are dissipative structures, originated by nonlinear processes operating between stars and the interstellar medium. As a consequence of the occurrence of dissipative processes in conditions far from equilibrium, spatial inhomogeneities or coherent temporal cycles may be expected to appear. (9 refs.)
- 64543 OJ 287. J.Bortle. *I.A.U. Circ. (USA)*, no.3792, 1 pp. (19 April 1983). The author reports visual magnitude estimates for the BL Lacertae object OJ 287, covering the period 1983 March 21 to April 6; the object is at about magnitude 14. (no refs.)
- 64544 Runaway instability in accretion disks orbiting black holes. M.A.Abramowicz, M.Calvani, L.Nobili (Dept. of Astrophys., Oxford Univ., Oxford, England). *Nature (GB)*, vol.302, no.5909, p.597-9 (14 April 1983). The runaway instability (very fast, 'catastrophic', mass exchange) operates in close binaries when the more massive star overflows its Roche lobe. The Roche lobe radius shrinks due to the mass exchange more rapidly than the radius of the star. The star keeps overflowing its Roche lobe and continuously loses mass. It has been found that a critical equipotential surface similar to the Roche lobe also exists in the black hole accretion disk system. The existence of this lobe is not connected with the gravity of the disk but is due to general relativistic effects in the gravitational field of the black hole alone. The authors argue that all accretion disks which overflow their Roche lobes and which have masses greater than a few per cent of the mass of the central hole are unstable with respect to runaway instability. This may be very important for quasars and other active galactic nuclei. (25 refs.)
- 64545 Double galaxies, their radial velocity measurement errors and mean mass-to-luminosity ratio. I.D.Karachentsev. *Pisma v Astron. Zh. (USSR)*, vol.9, no.2, p.67-74 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*. New radial velocity measurements are presented for 44 pairs of galaxies from the catalogue of isolated pairs of galaxies of the northern hemisphere by Karachentsev (1972), which have not been discussed in a previous spectra survey. Using the data for 75 galaxies, common for the author's catalogue and the sample by White et al. (1982), the absolute errors of radial velocity determinations for galaxies observed with the 6-m telescope are estimated. It is shown that the ratio of the external (absolute) error of velocity measurement to the inner one, $k=\sigma_e/\sigma_i$, changes from 1.0 to 2.1 while passing from strong emission line galaxies to objects with absorption spectra. An estimate of the mean value $k=1.4$ is obtained. (10 refs.)
- 64546 Light variability of the Seyfert galaxy Zw 0039.5+4003 (IV Zw 29). During 1967 through 1981. A.S.Sharov, V.P.Arkipova. *Pisma v Astron. Zh. (USSR)*, vol.9, no.2, p.82-5 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*. The light curve of the Seyfert galaxy Zw 0039.5+4003 (IV Zw 29) during the period 1967 to 1981 is given. The object shows B-variability in the range of 16.5^m-18.3^m. Light maxima were recorded in 1968, 1972 and 1980. (7 refs.)
- 64547 102 MHz observations of Seyfert galaxies. V.S.Artyukh, Yu.N.Vetukhnovskaya. *Pisma v Astron. Zh. (USSR)*, vol.9, no.2, p.86-9 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*. Observations of 73 Seyfert galaxies at the wavelength of 3 m have been carried out. Among them 5 Sy2 and 2 Sy1 galaxies turned out to be radio-sources. There are 6 Seyfert galaxies having scintillation components with steep spectra ($\alpha > 0.7$). The linear sizes of the components are the same as those of the compact components of distant quasars. (18 refs.)
- 64548 Cepheids and spiral structure. Yu.N.Efremov. *Pisma v Astron. Zh. (USSR)*, vol.9, no.2, p.94-101 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*. A difference is found between the distribution of Cepheids in the planes of the Galaxy and M31 at a distance of 10-12 kpc from the centre, this is probably due to the nearness of this distance to the corotation radius in the case of the Galaxy. It is noted that provided the width of the Carina-Sagittarius arm in the Galaxy is 2-3 kpc, this arm may turn out to be an analogue to the S4 arm in M31, which reveals a concentration of Cepheids of all periods and a transversal gradient of the youngest stellar ages. The periods of Cepheids in the Galaxy and M31 (and probably in general in other Sb galaxies) increase not toward the centre but toward the angular regions of maximal star formation rate. (37 refs.)

98.50K Groups, clusters, superclusters

- 64549 Analysis of optical imagery for Seyfert's Sextet and VV 172.** J.W.Sulentic (Dept. of Phys. & Astron., Univ. of Alabama, University, AL, USA), J.J.Lorre.
Astron. & Astrophys. (Germany), vol.120, no.1, pt.1, p.36-52 (April 1983).
Extensive image processing of 5 m photographs of Seyfert's Sextet and VV 172 is reported. New image processing techniques and new applications of old techniques are discussed. Six principal avenues of approach were taken in the image processing: 1. field-galaxy density analysis; 2. redshift-scaled imagery; 3. interaction morphology display and enhancement; 4. color difference imagery; 5. modeling of the VV 172 halo; and 6. image texture analysis of the spiral galaxy components of Seyfert's Sextet. The purpose of these analyses, aside from the presentation of the image processing techniques, was to evaluate the evidence for physical association of the discordant redshift components of these groups. Evidence is presented to show that the halo of VV 172, in particular, cannot be explained by the overlapping envelopes of galaxies with normal luminosity profiles. (26 refs.)
- 64550 The space correlation function of rich clusters of galaxies.** A.A.Klypin, A.I.Kopylov, P.S'ma v *Astron. Zh. (USSR)*, vol.9, no.2, p.75-81 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*
It is shown that the space correlation junction of Abell clusters of galaxies is approximated by the power law $\xi(r) = (50h^{-1} \text{ Mpc}/r)^{1.6}$ in the range of distances $5h^{-1} \text{ Mpc} < r < 100h^{-1} \text{ Mpc}$ ($h = H/50 \text{ km/s/Mpc}$). Results on redshift determinations for rich clusters in the region $\{r < 480 \text{ Mpc and } |b| \geq 30^\circ\}$ are used to estimate the correlation function. A considerable difference between the correlation function of clusters of galaxies and that of the galaxies themselves is difficult to explain and probably is evidence for the existence of a preferable scale of clustering. (18 refs.)

The Inflationary Universe lives? See Entry 64569

98.70 OTHER OBJECTS AND BACKGROUND RADIATIONS OF UNKNOWN ORIGIN AND DISTANCES

(for pulsars, see 97.60G)

98.70D Discrete radio sources

- 64551 VLA observations of H₂CO in DR 21.** H.R.Dickel, A.F.Lubenow (Dept. of Astron., Univ. of Illinois, Urbana, IL, USA), W.M.Goss, J.R.Forster, A.H.Rois.
Astron. & Astrophys. (Germany), vol.120, no.1, pt.1, p.74-84 (April 1983).
The H₂CO absorption at 6 cm from molecular gas in front of the radio continuum source DR 21 has been mapped with the Very Large Array with an angular resolution of 2" and a velocity resolution of 0.45 km s⁻¹. Three main velocity components are seen. Comparison of the distributions of H₂CO and other molecules indicates that for all them, the absorption is strongest in the southern part of DR 21, especially near H II region C. (16 refs.)
- 64552 Variability at 5 GHz in low luminosity radio nuclei of galaxies and quasars.** R.D.Ekers (Kapteyn Astron. Inst., Groningen, Netherlands), R.Fanti, G.K.Miley.
Astron. & Astrophys. (Germany), vol.120, no.2, pt.2, p.297-301 (April 1983).
The results of a six-year program to monitor the 5 GHz flux densities of a sample of low-luminosity compact radio components are presented. These include low-luminosity isolated compact sources in elliptical and spiral galaxies as well as the cores of extended double radio galaxies and quasars. Eight cases of definite variability and four cases of possible variability have been found. No significant difference is apparent for the variability percentages or time scales between the various types of weak sources studied in this paper and the stronger sources investigated by previous authors. The results provide marginal evidence against simple relativistic beaming explanations for high-luminosity compact sources. (38 refs.)
- 64553 Aperture synthesis observations of Orion B at 2.695 and 8.085 GHz.** J.E.Wink, W.J.Altenhoff (Max-Planck-Inst. fur Radioastron., Bonn, Germany), W.J.Webster, Jr..
Astron. & Astrophys. (Germany), vol.120, no.2, pt.2, p.322-5 (April 1983).
Interferometer observations of Orion B at 2.695 and 8.085 GHz are presented. Orion B appears to be a double source: one H II region associated with the star NGC 2024 #2 and an extended H II region surrounding the star NGC 2024 #1. This structure gives support to the model that the stars NGC 2024 #2 and #1 (of spectral type O 9.5 and B 0.5, respectively) ionize the nebula. (14 refs.)
- 64554 Beam models for extragalactic radio sources.** T.P.Ray (Univ. of Sussex, Brighton, England).
Irish Astron. J., vol.15, no.3, p.199-207 (March 1982). [received: April 1983]
The author discusses the radio spectra of radiogalaxies and also their structures and sizes. The formation of beams in the nuclei and their power sources are considered. Black hole roles are discussed. (14 refs.)

98.70J Quasars

- 64555 Low-frequency variability and predicted superluminal motion in 3C 147.** R.S.Simon, A.C.S.Readhead, A.T.Moffett (Owens Valley Radio Obs., California Inst. of Technol., Pasadena, CA, USA), P.N.Wilkinson, B.Allen, B.F.Burke.
Nature (GB), vol.302, no.5908, p.487-90 (7 April 1983).
VLBI observations of 3C 147 reveal that its core is a low-frequency variable radio source which has brightened by a factor of 2 in 6 years. In combination with X-ray observations, this implies that bulk relativistic motion is taking place within the core, and leads to the prediction that 3C 147 is a member of the class of superluminal radio sources. (30 refs.)

98.70Q X-ray and gamma-ray sources

- 64556 X-ray radio, and infrared observations of the 'rapid burster' (MXB 1730-335) during 1979 and 1980.** A.Lawrence, L.Cominsky, W.H.G.Lewin (Dept. of Phys., MIT, Cambridge, MA, USA), M.Oda, Y.Ogawara, H.Inoue, K.Koyama, K.Makishima, M.Matsuoka, T.Murakami, T.Ohashi, N.Shibazaki, Y.Tanaka, I.Kondo, S.Hayakawa, H.Kunieda, F.Makino, K.Masai, F.Nagase, Y.Tawara, S.Miyamoto, H.Tsunemi, K.Yamashita, T.Dashido, R.Oka, T.Ohkawa, T.Maruyama, T.Yokoyama, G.Nicholson, T.Balonek, W.A.Dent, I.S.Glass, B.S.Carter, A.W.Jones, M.J.Selby, C.Martinez Roger, C.Sanchez Magro, A.B.Giles, M.Duldig, A.Pramesh Rao, V.R.Venugopal, R.F.Haynes, D.L.Jauncey, H.Okuda, S.Sato, Y.Kobayashi, J.Jugaku, D.Backman, R.Pogge, P.E.Hodge, H.D.Aller, J.van Paradijs.
Astrophys. J. (USA), vol.267, no.1, pt.1, p.301-9 (1 April 1983).
Reports partially simultaneous observations of the 'rapid burster' (MXB 1730-335) at X-ray, infrared, and radio wavelengths, covering several hundred hours during 1979 and 1980. No infrared or radio bursts were observed. Reported radio bursts are either unreal or do not bear a simple relation to the X-ray bursts from the rapid burster. The status of the reported infrared bursts also remains ambiguous. The authors also report limits to the brightness of any persistent radio source at the position of MXB 1730-335, limits to persistent X-ray emission during an extended X-ray quiet phase, and a measurement of the infrared polarization in the direction of the X-ray source. (34 refs.)
- 64557 Discovery of X-ray bursts from GX 3+1 (4U 1744-26).** K.Makishima, K.Mitsuda, H.Inoue, K.Koyama, M.Matsuoka, T.Murakami, M.Oda, Y.Ogawara, T.Ohashi, N.Shibazaki, Y.Tanaka, F.J.Marshall (Inst. of Space & Astronautical Sci., Tokyo, Japan), S.Hayakawa, H.Kunieda, F.Makino, F.Nagase, Y.Tawara, S.Miyamoto, H.Tsunemi, K.Tsuno, K.Yamashita, I.Kondo.
Astrophys. J. (USA), vol.267, no.1, pt.1, p.310-14 (1 April 1983).
During the Hakucho observations of the galactic center region in 1980 July-August, 15 X-ray bursts were observed for the first time from a bright bulge source GX 3+1 (4U 1744-26). These bursts exhibit characteristics typical of type I cosmic X-ray bursts. No bursts, however, were observed from GX 3+1 in previous Hakucho observations conducted in 1979 and early 1980. The persistent X-ray flux of GX 3+1 in 1979-1980 was roughly half the value obtained in 1971-1978 by other observers. (22 refs.)
- 64558 Models of X-ray bursters with radius expansion.** B.Paczynski (Theoretical Astrophys., California Inst. of Technol., Pasadena, CA, USA).
Astrophys. J. (USA), vol.267, no.1, pt.1, p.315-21 (1 April 1983).
A series of models of helium shell flashes on a neutron star is presented. To make models simple, no hydrogen was present and a small nuclear reaction network was used. General relativity was fully taken into account. Variation of electron scattering opacity with temperature and density was allowed for, and it was most essential for producing hydrostatic expansion of the outer layers of models. The models which expanded had relatively large helium envelope masses, developed strong shell flashes, and displayed a double peak variation of surface temperature with time. They may help to understand some X-ray bursters. (18 refs.)
- 64559 Gamma-ray astronomy.** B.Houston, A.W.Wolfendale (Univ. of Durham, Durham, England).
Irish Astron. J., vol.15, no.3, p.181-98 (March 1982). [received: April 1983]
A brief description is given of the present status of gamma-ray astronomy, both galactic and extragalactic. More detailed attention is given to a specific question: the nature of the apparent 'γ-ray sources'. The undoubted correlation of at least some of the sources with dense clouds of gas in the interstellar medium is discussed. A new analysis of the SAS II satellite data is described and comparisons are made between the 'source catalogue' from these data with the well-known 2CG catalogue from the COS-B experiment. (19 refs.)

98.80 COSMOLOGY

(for observational cosmology, see 98.70V; for origin and evolution of galaxy, see 98.50)

64560 The evolution of shear and gravitational wave perturbations of Friedmann models and the isotropy of the Universe. J.L.Sanz (Dept. de Física Teórica, Univ. de Santander, Santander, Spain). *Astron. & Astrophys. (Germany)*, vol.120, no.1, pt.1, p.109-12 (April 1983). Considers the evolution of shear and gravitational waves, larger than the Hubble length, in Friedmann universes. By considering a perfect fluid with a linear equation of state, $p=np$, the author obtains exact analytical solutions for the perturbations in the flat case and closed-form solutions in the open and closed cases if the content of the Universe is represented either by dust, $p=0$, or radiation, $p=1/3p$. The behaviour of the different relative quantities, during the evolution of the different models, is analyzed. The difficulty to explain the present observed universal homogeneity and isotropy unless one postulates special initial conditions is stated. (15 refs.)

64561 Anisotropic cosmology. Two energy distributions generating a conformal gravitational field associated to the Kantowski-Sachs field. M.Bray. *C.R. Seances Acad. Sci. Ser. II (France)*, vol.296, no.5, p.317-20 (7 Feb. 1983). In French. Two anisotropic space-times (MHD, pure radiation) described by a metric $ds^2 = \Omega^2 [ds^2 \text{ K.-S.}]$. (1 ref.)

64562 The impossibility of a bouncing Universe. A.H.Guth (Dept. of Phys., MIT, Cambridge, MA, USA), M.Sher. *Nature (GB)*, vol.302, no.5908, p.505-7 (7 April 1983). Petrosian (1982) has recently discussed the possibility that the restoration of symmetry at grand unification in a closed contracting Robertson-Walker Universe could slow down and halt the contraction, causing the Universe to bounce. He then went on to discuss the possibility that our Universe has undergone a series of such bounces. The authors disagree with this analysis. Sher (1980) has already shown that if a contracting Universe is dominated by radiation, then a bounce is impossible. The authors show two further results: (1) entropy considerations imply that the quantity S , which must decrease by $\sim 10^{75}$ to allow the present Universe to bounce, can in fact decrease by no more than a factor of ~ 2 ; (2) if the true vacuum state has zero energy density, then a Universe which is contracting in its low temperature phase can never complete a phase transition soon enough to cause a bounce. (3 refs.)

64563 How stable is our vacuum?. P.Hut, M.J.Rees (Inst. for Advanced Study, Princeton, NJ, USA). *Nature (GB)*, vol.302, no.5908, p.508-9 (7 April 1983). It is possible that the vacuum state we live in is not the absolute lowest one. In many spontaneously broken field theories a local minimum of the effective potential, which can be quite stable, can exist for certain parameter values. The Universe, starting at a high temperature, might have supercooled in such a local minimum. If such a metastable minimum is separated by a high enough barrier from the absolute minimum, the tunneling rate from the 'false' to the 'true' vacuum may be slow enough to not have occurred in one Hubble-spacetime volume. In that case our vacuum state might suddenly disappear if a bubble of real vacuum formed which was large enough for the bulk energy gain to exceed the surface energy density in its walls. Although the persistence of the present vacuum for 10^{10} yr implies that a spontaneous transition via tunnelling is unlikely, one can ask whether a new generation of elementary particle accelerators might trigger such an unfortunate event. The authors show that this chance, fortunately, is completely negligible since the region inside our past light cone has already survived some 10^5 cosmic ray collisions at centre of mass energies of 10^{11} GeV and higher. (7 refs.)

64564 Void in the closed Universe. K.-I.Maeda, M.Sasaki, H.Sato (Res. Inst. for Fundamental Phys., Kyoto Univ., Kyoto, Japan). *Prog. Theor. Phys. (Japan)*, vol.69, no.1, p.89-99 (Jan. 1983). The evolution of a low density spherically symmetric region, which the authors call a void, in the high density closed Universe is investigated. This void expands forever while the unperturbed region collapses finally. The enlargement factor of the void is given and the global structure of a model Universe with one void is analysed. (7 refs.)

64565 The production of string loops in an expanding universe. N.Turok (Phys. Dept., Univ. of Virginia, Charlottesville, VA, USA). *Phys. Lett. B (Netherlands)*, vol.123B, no.6, p.387-90 (14 April 1983). The production of closed loops of string in an expanding universe, and how these might later seed the process of galaxy formation is discussed. It is shown how the motion of string is damped on scales larger than the horizon, and is free beneath the horizon. In particular when two waves meet beneath the horizon it is shown how non-self-intersecting loops are produced. It is speculated that each loop leads to the formation of a single galaxy. (9 refs.)

64566 Natural values of coupling constants and cosmological inflation in a supersymmetric model. C.E.Vayonakis (Lab. de Phys. Theorique et Hautes Energies, Univ. Pierre et Marie Curie, Paris, France). *Phys. Lett. B (Netherlands)*, vol.123B, no.6, p.396-400 (14 April 1983). The range of values of the temperature dependent coupling constants in a supersymmetric model is examined and the consequences for the inflationary Universe scenario are discussed. (28 refs.)

64567 Axions and the primordial monopole problem. G.Lazarides (Rockefeller Univ., New York, NY, USA), Q.Shafi. *Phys. Lett. B (Netherlands)*, vol.124B, no.1-2, p.26-8 (21 April 1983). The inevitable existence of an intermediate mass scale in axion models is used to solve the primordial monopole problem of Grand Unified Theories. It is shown that in the case where axions provide the dark matter of the Universe a measurable magnetic monopole flux may exist in our Galaxy. (22 refs.)

64568 The future of the Universe. D.A.Dicus, J.R.Letaw, D.C.Teplitz, V.L.Teplitz. *Sci. Am. (USA)*, vol.248, no.3, p.74-85 (March 1983). A forecast is given for the expanding Universe through to the year 10^{100} . All protons will decay, galaxies will form black holes and black holes will 'evaporate'. If the Universe collapses, it may cycle. (no refs.)

64569 The Inflationary Universe lives?. D.H.Smith. *Sky & Telesc. (USA)*, vol.65, no.3, p.207-10 (March 1983). The author discusses the cosmological implications of Grand Unified Theories, which combine the electromagnetic interaction, the weak nuclear interaction and the strong nuclear interaction. An essential element of these theories is the existence of a phase transition (spontaneous symmetry breaking) between a high-energy symmetric vacuum state and a low energy asymmetric vacuum state. In the Inflationary Universe hypothesis of Guth, this phase transition occurred during the very early history of the Universe (at $t \sim 10^{-35}$ s), and the consequent release of latent heat led to an acceleration of the expansion of the Universe and to an increase in its radius by a factor of 10^{20} to 10^{30} . Some difficulties with this model, connected with the origin of galaxies and clusters of galaxies, are discussed briefly. (no refs.)

64570 Beyond the Big Bang. A.MacRobert. *Sky & Telesc. (USA)*, vol.65, no.3, p.211-13 (March 1983). The author discusses cosmological theories related to the cause of the Big Bang and to the creation of everything from nothing. In these theories the origin of the Universe is connected with the creation of mass energy and gravitational potential energy by quantum fluctuations; these fluctuations occur either in a flat empty space or in a curved space ('superspace') that lies outside the space-time continuum of our Universe. A corollary of these theories is that our Universe is not unique; the events that created our Universe must have happened many times. Some evidence for the existence of superspace and a plurality of universes is found in the anthropic principle and in the existence of life in our Universe. (no refs.)

98.90 OTHER TOPICS IN GALACTIC AND EXTRAGALACTIC ASTRONOMY

64571 White holes: cosmic energy machines. J.Narliker (Tata Inst. of Fundamental Res., Bombay, India). *New Sci. (GB)*, vol.97, no.1346, p.516-18 (24 Feb. 1983). White holes are the poor relations of black holes, neglected by the mainstream of astrophysics. The author discusses a new concept of a cosmic oscillator, however, which accords equal roles to both. (no refs.)

BIBLIOGRAPHY INDEX

- ⁶⁷Zn Mossbauer spectroscopy, (59 refs.) 62846
 Abstraction vs. exchange channels in D+HCl reaction, (58 refs.) 63522
 Acoustic emission during phase transformations in alloys, (94 refs.) 63486
 Adhesion of polymers to metal surfaces, (72 refs.) 63491
 Arctic seafloor, (75 refs.) 64119
 Atmosphere aerosol loss mechanisms, (56 refs.) 64214
 Atomic spectroscopy July-December 1982, (568 refs.) 59560
 Automatic camera lens focusing systems, (57 refs.) 59869
 Back arc spreading and arc volcanism in Philippine Sea, (52 refs.) 64137
 Basic-potential method for studying crystal potential, (124 refs.) 61850
 Beta decay and the weak interaction, (103 refs.) 59577
 Boninite magma series, (77 refs.) 64104
 Charged particle reaction cross sections and nucleosynthesis, (92 refs.) 64460
 Chronology of particle physics, (165 refs.) 59582
 Conversion electron Mossbauer spectroscopy, (83 refs.) 62849
 Crab Nebula, (51 refs.) 64528
 Cyclic and linear poly(dimethyl siloxanes) study, (53 refs.) 61032
 Diffusion of substitutional impurities in iron, (75 refs.) 62175
 Disc-like molecules and mesogenic polymorphism, (90 refs.) 61785
 Earthquake precursory seismicity patterns, (76 refs.) 64066
 Earthquake seismic precursors, (113 refs.) 64075
 Effects of ionizing radiation on amorphous insulators, (52 refs.) 61805
 Electromagnetic and weak interactions in stochastic space-time, (116 refs.) 59961

Electron-atom scattering, (123 refs.)	60988	Phase space vortices and double layers, kinetic theory, (77 refs.)	61662
Enthalpies of formation of iron alloys, (186 refs.)	63581	Photoemission from surface-atom core levels, (103 refs.)	63134
Fatigue crack closure, roughness-induced, (107 refs.)	63401	Plasma double layers, (60 refs.)	64373
Formation of disc galaxies, (107 refs.)	64537	Plate tectonics of Philippines and NE Indonesia, (66 refs.)	64065
Fractionally charged ions in crystal lattices of organic ion-radical salts, (59 refs.)	61847	Polymaleic anhydride synthesis and properties, (53 refs.)	63549
Galaxy centre H I distribution, (127 refs.)	64541	Polymerisation initiated by reducing transition metal compounds, (70 refs.)	63548
High-rate sputter deposition technique, (55 refs.)	63158	Polymorphism in polar mesogens, (81 refs.)	61779
Horizontal-branch stars, (71 refs.)	64461	Polymorphism in polar mesogens, (37 refs.)	61780
Hydrocarbon chemistry in irradiated CO ₂ /CO/CH ₄ /H ₂ O/H ₂ mixtures, (66 refs.)	63579	Polymorphism in polar mesogens, (55 refs.)	61781
Hydrological techniques involving tracers, (86 refs.)	64263	Precipitation of supersaturated aluminium-base solid solutions, (128 refs.)	63300
Indian Phanerozoic palaeomagnetism, (75 refs.)	64028	Protein adsorption in polymer-blood interaction processes, (115 refs.)	63773
Infrared laser stimulated surface processes, (64 refs.)	63587	Pulsar radiation mechanisms, (51 refs.)	64503
Infrared speckle imaging of Miras and protostars, (55 refs.)	64392	QCD cornerstones, (294 refs.)	59992
Intramolecular vibrational relaxation from C-H stretch fundamentals, (52 refs.)	60809	Quantum electrodynamics, (54 refs.)	59581
Japan earthquake prediction programme, (84 refs.)	64240	Quaternary sedimentation in South China Basin, (55 refs.)	64134
Japanese palaeomagnetism, (83 refs.)	64030	Radiation hormesis, public health and public policy, (77 refs.)	59583
Langmuir turbulence, (52 refs.)	61647	Randomly mixed magnets with competing interactions, (53 refs.)	62574
Large earthquake recurrence times, (97 refs.)	64071	Reaction Hg + I ₂ - HgI + I revisited, (58 refs.)	63527
Large earthquake repeat times, (100 refs.)	64072	Retinal colour coding, (60 refs.)	63834
Light meson spectroscopy, (190 refs.)	60006	Semiclassical determination of adiabatic barriers on a three-dimensional potential energy surface, (67 refs.)	60630
Light scattering changes in chloroplast thylakoid membranes, (57 refs.)	63795	Sensitivity to countermodulating gratings following spatiotemporal adaptation, (54 refs.)	63844
Lower trench slope off Nias Island, Sunda Arc, (65 refs.)	64135	Sheared colloidal suspensions, (70 refs.)	61544
Luminance increment and decrement time thresholds, (54 refs.)	63843	Si ₃ N ₄ preparation, reaction mechanisms, (84 refs.)	63219
Lytotropic polymeric liquid crystals, (45 refs.)	61778	Solar System sputtering, (52 refs.)	64409
Magnetism of amorphous metal-metal alloys, (67 refs.)	62566	Solution of the Kondo problem, (86 refs.)	62551
Manganese halides and sulphide, electron spin resonance at 4K, (55 refs.)	60764	Spectroscopy and integral image quality, (79 refs.)	59870
Marine magnetic anomalies from West Philippine Sea, (72 refs.)	64036	Spectroscopy of vibration assisted surface chemistry, (86 refs.)	63585
Microscopic equipment, methods, applications and related topics, (875 refs.)	59561	Standard interfaces for program-modular multiprocessor systems, nuclear physics applications, (50 refs.)	60560
Molecular and submolecular physical concepts in biology, (62 refs.)	63769	Structure and function of viroids, (58 refs.)	63774
Monte Carlo simulation of solid N ₂ , (57 refs.)	61848	Sun, gamma rays and cosmic rays, (103 refs.)	64330
Mossbauer spectroscopy and magnetism, (67 refs.)	62841	Superflows and superfluidity, (105 refs.)	62200
Mossbauer spectroscopy of implanted sources, (93 refs.)	62844	Supernovae, (760 refs.)	64496
Mossbauer spectroscopy with ^{191,193} Ir, (141 refs.)	62847	Surface electromagnetic fields, (125 refs.)	61056
Mossbauer spectroscopy with actinide elements, (58 refs.)	62848	Surface enhanced Raman scattering, (62 refs.)	62959
Mossbauer studies of valence fluctuations, (57 refs.)	62845	Surface enhanced Raman spectra, (60 refs.)	62967
Multicritical phenomena in liquid crystals, (84 refs.)	62099	Surface vibration spectroscopy by atom scattering, (54 refs.)	63119
Myopia development in nonhuman primates, (71 refs.)	63828	Technicolor, (93 refs.)	59991
Na ₂ , properties, (329 refs.)	60802	Tokai District, Japan, earthquake prediction, (165 refs.)	64074
Nematic to smectic-A transition, (60 refs.)	62098	Transparent conductors, (293 refs.)	63078
Neutral-current experiments, (99 refs.)	60034	Triatomic molecules, double excited vibr. states dynamics, (52 refs.)	60688
North American palaeomagnetism, (364 refs.)	64034	Twisted chiral mesophases, (152 refs.)	61784
Nuclear waste disposal, regulations in different countries, (62 refs.)	60231	U prospecting by γ-ray borehole methods, (125 refs.)	64255
Oxygen donor in gallium phosphide, (54 refs.)	62365	Uranium extrapolation by airborne γ-ray spectrometry, (57 refs.)	64254
Paleomagnetism and plate motions in SE Asia, (147 refs.)	64038	Valence and hybrid bond orbital theory, (97 refs.)	60562
Paleomagnetism of Australia and Antarctica, (110 refs.)	64027	Vibrational energy disposal in reactions of fluorine atoms with hydrides of groups III, IV and V, (57 refs.)	63514
Paleomagnetism of Africa and Madagascar, (96 refs.)	64026	Volcanic rocks of Philippine Sea, (102 refs.)	64103
Particle simulation of plasmas, (105 refs.)	61692	Volcanoes of Earth, Moon, Mars, Io, Venus, (113 refs.)	64408

BOOK INDEX

- Adsorption on metal surfaces. An integrated approach;** J.Bernard (editor/s). [Amsterdam, Netherlands: Elsevier 1983] 59555
- Analysis, manifolds and physics. Revised edition;** Y.Choquet-Bruhat, C.DeWitt-Morette, M.Dillard-Bleick. [Amsterdam, Netherlands: North-Holland 1982] 59554
- Channels of Mars;** V.R.Baker. [Bristol, England: Adam Hilger 1982] 59552
- Elementary statistical thermodynamics. A problems approach;** N.O.Smith. [New York, USA: Plenum 1982] 59558
- Energy reviews. Nuclear power systems. Vol.1;** L.A.Melentiev (editor/s). [Chur, Switzerland: Harwood Academic Publishers 1982] 59549
- Neutron sources. For basic physics and applications;** [Oxford, England: Pergamon 1983] 59546 (introductory abstract), 60515-25
- Paleoreconstruction of the continents;** M.W.McElhinny, D.A.Valencio (editor/s). [Washington, DC, USA: American Geophysical Union 1981] 59544 (introductory abstract), 64026-35, 64116-19
- Plutonium recycling scenario in light water reactors. Assessment of the environmental impact in the European Community;** [Chur, Switzerland: Harwood Academic Publishers 1982] 59523
- Probabilistic and statistical aspects of quantum theory;** A.S.Holevo. [Amsterdam, Netherlands: North-Holland 1982] 59557
- Realism and the aim of science;** K.R.Popper. [London, England: Hutchinson 1983] 59547
- Relativistic astrophysics;** M.Demianski. [Oxford, England: Pergamon 1981] 59551
- Research and development on radioactive waste management and storage. First annual progress report of the European Community programme 1980-1984;** [Chur, Switzerland: Harwood Academic Publishers 1982] 59548
- Spectral transform and solitons: Tools to solve and investigate nonlinear evolution equations. Vol.1;** F.Calogero, A.Degasperis. [Amsterdam, Netherlands: North-Holland 1982] 59556
- Superconductivity in ternary compounds. II. Superconductivity and magnetism;** M.B.Maple, O.Fischer (editor/s). [Berlin, Germany: Springer-Verlag 1982] 59553
- Tectonic and geologic evolution of southeast asian seas and islands;** D.E.Hayes (editor/s). [Washington, DC, USA: American Geophysical Union 1980] 59545 (introductory abstract), 64036-8, 64065, 64097-9, 64102-4, 64120, 64132-7, 64139

CONFERENCE INDEX

- Low-level waste disposal, 1982;** Arlington, VA, USA, 16-17 June 1982, [U.S. Nucl. Regul. Comm.; Oak Ridge Nat. Lab] (Oak Ridge, TN, USA: Oak Ridge Nat. Lab. 1982] 59537 (introductory abstract), 60250-68
- Advanced Space Instrumentation in Astronomy;** Ottawa, Canada, 16 May-2 June 1982, [1982] 59524 (introductory abstract), 59787, 59841, 61257, 61262, 64338-48, 64379-84, 64390
- Application of accelerators in research and industry;** Denton, TX, USA, 8-10 Nov. 1982, [DOE: NSF: D.A.R.P.A.: Naval Surface Weapons Centre; NBS; et al] [April 1983] 59528 (introductory abstract), 59882, 59899, 60104, 60131, 60147, 60174-6, 60182, 60186, 60190, 60214-15, 60232-3, 60390-3, 60491, 60506-11, 60612, 60626, 60662, 60899, 60933-53, 60963-70, 60983, 60989, 61608, 61658, 61699-700, 62003, 63088, 63113-15, 63611-17, 64367
- Astronomical Science Group of Ireland May 1981 Meeting;** Cork, Ireland, 22 May 1981, [March 1982] 59529 (introductory abstract)
- Astrophysical applications of accretion disks;** London, England, 8 Oct. 1982, [April 1983] 59533 (introductory abstract)
- Axes measurement systems;** London, England, 2 March 1983, [London, England: IEE 1983] 60346
- Earthquake prediction;** Mohonk, NY, USA, 12-16 May 1980, [D.W.Simpson, P.G.Richards (editor/s), [Washington, DC, USA: American Geophys. Union 1981] 59541 (introductory abstract), 64066-78, 64121-3, 64240
- Electronic displays;** London, England, 5-7 Oct. 1982, [Buckingham, Bucks., England: Network Exhibition 1982] 63855
- Excimer lasers;** Incline Village, NV, USA, 10-12 Jan. 1983, [Opt. Soc. America; Air Force Office Sci. Res.; IEEE] [Washington, DC, USA: Opt. Soc. America 1983] 59858, 59874, 60732-3, 60738, 60830-1, 60873-4, 61195, 61217, 61965, 63283, 64276
- Exploration of the polar upper atmosphere;** Lillehammer, Norway, 5-16 May 1980, [C.S.Deehr, J.A.Holtet (editor/s), [Reidel: Dordrecht, Netherlands 1981] 59540 (introductory abstract)
- Fusion technology 1982;** Julich, Germany, 13-17 Sept. 1982, [Oxford, England: Pergamon 1983] 60405-74, 60498, 60526-9, 61686-9, 61708-11
- Grain boundaries in semiconductors;** Boston, MA, USA, Nov. 1981, [H.J.Leamy, G.E.Pike, C.H.Seager (editor/s), [New York, USA: North-Holland 1982] 62278, 62373-7, 62409, 62428-9, 62457, 63172
- High energy spin;** Westhampton Beach, NY, USA, Sept. 1982, [1982] 59565, 59902, 59934-7, 60040-8, 60070, 60080-92
- History of particle physics;** Paris, France, 21-23 July 1982, [Dec. 1982] 59566 (introductory abstract), 59567-82
- Indian radiation protection;** Bombay, India, 19-23 Jan. 1981, [March 1983] 59527 (introductory abstract)

- LMFBR safety**; Lyon-Ecully, France, 19-23 July 1982, (*European Nucl. Soc.: AINS*) [Paris, France: Societe Francaise d'Energie Nucleaire 1982] 60331, 60344-5, 60366-88, 63653
- Magnetic films and surfaces**; Yokohama, Japan, 13-16 Sept. 1982, [March 1983] 61270, 61372, 61906, 62220, 62293-6, 62508-10, 62520, 62566, 62690, 62702, 62717-20, 62728-62, 62770-7, 62791-5, 62858-64, 62944-6, 63157, 63182, 63451
- Magnetism**, Kyoto; Kyoto, Japan, 6-10 Sept. 1982, [Feb. 1983] 62506, 62682-5, 62711-16, 62725-6, 62769, 62783, 62855-7, 62942
- Magnetism**, Kyoto; Kyoto, Japan, 6-10 Sept. 1982, [Feb. 1983] 59732, 61803, 61811-12, 62089, 62125, 62192, 62387-9, 62431, 62507, 62533-4, 62538-41, 62544, 62547, 62552-5, 62559-65, 62569-72, 62574-5, 62581-5, 62589-608, 62620-43, 62654-61, 62669-73, 62686-9, 62697-701, 62721-4, 62727, 62784-90, 62798, 62803, 62809, 62816-17, 62826, 62943
- Nonlinear fluid behavior**; Boulder, CO, USA, 7-11 June 1982, [March 1983] 59596, 59709-10, 59744, 61403, 61472, 61485-6, 61501, 61531, 61544, 61569, 61588, 61769-70, 61789, 62057, 62118-19
- Nuclear waste management V**; Berlin, Germany, 7-10 June 1982, *W.Lutze* (editor/s), [New York, USA: North-Holland 1982] 60269-328, 63471, 63751-2
- Optical fiber communication, 1983**; New Orleans, LA, USA, 28 Feb.-2 March 1983, [New York, USA: IEEE 1983] 59536 (introductory abstract),
- Photovoltaic solar energy**; Stresa, Italy, 10-14 May 1982, *W.H.Bloss, G.Grassi* (editor/s), [Dordrecht, Netherlands: Reidel 1982] 61950, 62176, 62521, 63152, 63164, 63177, 63187, 63648-50, 63683-715
- Plasma physics**; Goteborg, Sweden, 9-15 June 1982, [1982] 61612, 61618, 61621, 61662, 64301, 64327-8, 64371-3, 64502-3, 64516-17
- Plasma physics**; Goteborg, Sweden, 9-15 June 1982, [1982] 59880, 60398-401, 61170, 61489, 61632-40, 61649-50, 61655, 61679-81, 62441, 64332
- Power engineering**; Manchester, England, 30 March-1 April 1982, [Manchester, England: Univ. Manchester Inst. Sci. Technol. 1982] 63639
- Processes of planetary rifting**; St. Helena, CA, USA, 3-5 Dec. 1981, (*American Geophys. Union; Lunar & Planetary Inst.; NASA; NSF*) [1983] 64093-6, 64101, 64108-15, 64138
- Properties and applications of metal hydrides**; Toba, Japan, 30 May-4 June 1982, [Feb. 1983] 60334-5, 60394, 61007-10, 61384-5, 61567-8, 62047-8, 62062, 62114-15, 62164, 62366, 63561-2, 63583-4, 63635, 63722-3, 63732-3, 63735-44
- Quantum chemistry**; Uppsala, Sweden, 13-20 June 1982, [March 1983] 59604-6, 59726, 60561-2, 60570-6, 60591-2, 60594-5, 60600, 60613, 60631, 60835, 60884-5, 61848, 61914, 62246, 62328, 62355, 62378, 63032, 63515-17
- Radiation and the worker**; London, England, 7 Jan. 1983, [March 1983] 59535 (introductory abstract),
- Radiation effects in insulators**; Arco, Largo di Garda, Italy, 1981, [1982] 59534 (introductory abstract), 60243, 61805, 61939-43, 61966-7, 61975, 61983, 61990-9, 62004-5, 63126, 63578, 64375, 64409
- Railway and tracked transit system noise**; Monument, CO, USA, 8-10 April 1981, [22 March 1983] 59530 (introductory abstract),
- Random walks and their application to physical and biological sciences**; Gaithersburg, MD, USA, 28 June-1 July 1982, [Feb. 1983] 59531 (introductory abstract), 59684-707, 62027, 62152, 63771, 63778, 63816
- Reevaluations of dosimetric factors**; Germantown, MD, USA, 15-16 Sept. 1981, (*Office Health Environ. Res.; Office Energy Res.; U.S. Dept. Energy*) *V.P.Bond, J.W.Thiessen* (editor/s), [Oak Ridge, TN, USA: U.S. Dept. Energy 1982] 59542 (introductory abstract),
- Refractory metals, hardmetals and special materials**; Reutte, Austria, 1-5 June 1981, [1982] 59762, 59795, 62007, 62053, 62077, 62079, 62390, 62882, 62927, 63167-8, 63173, 63249, 63317
- Signal recovery and synthesis**; Incline Village, NV, USA, 12-14 Jan. 1983, (*Opt. Soc. America; Air Force Office Sci. Res.*) [Washington, DC, USA: Opt. Soc. America 1983] 61082, 61730, 63925, 63953-61, 64277
- Sintering, theory and practice**; Portoroz, Yugoslavia, 7-10 Sept. 1981, *D.Kolar, S.Pejovnik, M.M.Ristic* (editor/s), [Amsterdam, Netherlands: Elsevier 1982] 59538 (introductory abstract), 63185, 63192-201, 63206-14, 63217-18, 63225-48, 63252-3
- Stochastic processes in quantum and statistical physics**; Marseille, France, 29 June-4 July 1981, *S.Albeverio, P.Combe, M.Sirugue-Collin* (editor/s), [Berlin, Germany: Springer-Verlag 1982] 59543 (introductory abstract), 59628-34, 59668-9, 59676-7, 59719-24, 59739-41, 59746-7, 59931-2, 62350, 62668
- South African health physics**; Bloemfontein, South Africa, 16-18 March 1981, [March 1983] 59526 (introductory abstract),
- Supercritical fluids: Their chemistry and application**; Cambridge, England, 13-15 Sept. 1982, [March 1983] 59525 (introductory abstract), 59794, 61592, 62051-2, 62071-6, 62111
- System modelling and optimisation**; New York, USA, 31 Aug.-4 Sept. 1981, *R.F.Drenick, F.Kozin* (editor/s), [Berlin, Germany: Springer-Verlag 1982] 63888
- System simulation and scientific computation**; Montreal, Canada, 8-13 Aug. 1982, (*IMACS: Int. Assoc. Math. Modelling; Int. Soc. Comput. Methods Eng.; et al.*) [New Brunswick, NJ, USA: IMACS 1982] 61397, 61519, 61605, 61619, 61643-4, 61685, 61693-7, 63767
- Topics in ocean physics**; Varenna, Italy, 7-19 July 1980, *A.R.Osborne, P.Malanotte Rizzoli* (editor/s), [Amsterdam, Netherlands: North-Holland 1982] 59539 (introductory abstract),
- Total solar eclipse (1980 February 16)**; New Delhi, India, Jan. 1981, [Oct. 1982] 59559, 64192-207, 64237, 64302-8

Electronic Reliability Data

A guide to selected components

Electronic Reliability Data is an accurate, up to date source of numerical data on the reliability of electronic components.

Failure Rates

Precise values are given of failures per million hours of a large number of electronic components from resistors to microcircuits.

Operational Experience

Much of the data is drawn from the analysis and evaluation of actual failures in an industrial environment.

Environmental Factors

The effect of many different environmental factors have been evaluated and their effect on failure rates determined. Such factors include:-

- Electrical stress ratio
- Temperature
- Age
- Storage

Applications

The effects of different applications have been quantified so that failure rates can be determined for the use of components in applications varying from digital computers to rocket launches.

Electronic Reliability Data provides an accurate assessment of the likely failure rate of components and is the most complete and up to date source of numerical data available. A concise guide to the subject of reliability is given and there is an extensive bibliography of over 700 references with abstracts, to the most recent literature on the subject.

Electronic Reliability Data: A guide to selected components.

Components covered: Resistors, Capacitors, Diodes, Transistors, Thyristors, Microcircuits.

225 pages, ISBN 852962 40 1 £125 (\$300 Americas only)

Librarianship and Information Studies Series

The authors in this series deal in a practical way with the problems faced by libraries and information scientists that have been the subjects of research within past years. The results of the latest research are analysed, discussed and related to real situations. Workers at centres of study of librarianship and information science will, through this series, be presented with invaluable aids to further research; librarians and information scientists 'in the field' will also find much food for thought.

1. Computer-based information services in science and technology: principles and techniques.

M. F. Lynch

96pp., 234 x 156mm, casebound, 1974, ISBN 0 901223 55 7,
£3.65 UK, \$ 9.00 Americas, £4.30 Elsewhere

This book covers the application of computers to the major information services in science and technology. Coverage is given to the problems of character representation and transformation during input; storage and output; data and record description and storage structures; and typical filehandling systems and file manipulations. The role of computer type-setting in the production of publications is described at some length, as are the characteristics and implementation of information-retrieval services.

2. Asian and African collections in British libraries: problems and prospects

A. Benewick

139pp., 234 x 156mm, casebound, 1974, ISBN 0 901223 48 4,
£6.20 UK, \$ 14.50 Americas, £7.25 Elsewhere

This book discusses the administrative problems of establishing and maintaining Asian and African collections in Britain. Particular emphasis is placed on acquisition, interlibrary co-operation, bibliographical control and finance. The impact of area collections on general library techniques, and the prospects for area collections, from the viewpoint of developing adequate national provision for them, are also discussed.

3. Languages of indexing and classification: a linguistic study of structures and functions

W. J. Hutchins

160pp., 234 x 156mm, casebound, 1975, ISBN 0 901223 68 9,
£8.00 UK, \$ 19.00 Americas, £9.35 Elsewhere

Within the broad field of information science, the problems of indexing and classification continue to occupy positions of central and crucial importance. In recent years there have been impressive developments in automated information-retrieval systems, but these have not led to any lessening of interest in indexing and classification theory, although understanding of these basic processes remains inadequate. This volume contributes to the understanding of the fundamental questions of the nature of indexing languages—how they work and why they sometimes fail. This book is an examination of the basic features of the theoretical issues of indexing and classification in terms of linguistic structures and functions, and assumes that readers have some knowledge of the languages of documentation and the problems of indexing and information retrieval.

4. Libraries for the blind: an international study of policies and practices

D. E. Schauder and M. D. Cram

152pp., 234 x 156mm, casebound, 1977 ISBN 0 901223 91 3,
£10.00 UK, \$ 23.50 Americas, £11.70 Elsewhere

This study reviews contemporary practices, policies and trends in library services for blind and partially sighted people. Most available accounts of such services have confined themselves to a particular country, reading medium or technical development. This study, however, can be said to be truly international, and extremely comprehensive. The authors, both practising librarians, present the results of research which included many visits to libraries for the blind and related organisations, from which valuable information was gained that was not readily available except by personal contact. Furthermore, their literature search extends up to 1976, resulting in an extensive bibliography. The book can be used equally as a textbook for students of librarianship, or as a guide for practising librarians.

5. Information management

D. Mason

121pp., 234 x 156mm, casebound, 1978, ISBN 0 906048 15 2,
£7.50 UK, \$ 18.00 Americas, £9.00 Elsewhere

This volume is a highly practical guide to the management of industrial information services. From the premise that the information manager should take a positive approach to his company's information needs, the author discusses the managerial problems of establishing and running an information service within a company and emphasises practical techniques for their solution. Location, planning and finance are some of the topics covered. Several case-study exercises are given to underline the text, and key texts for further study are appended to each chapter. Although written primarily for industrial information managers and for new entrants into industrial information services, this volume will be of interest to all who work in, or are responsible for, information services.

Antennas and propagation

The papers presented at the international conference on antennas and propagation have now been published as number 169 in the IEE Conference Publication series. The conference, held in London in November 1978, was sponsored by the IEE Electronics Division in association with the IEEE, the IMA, the IoP, the IERE, and URSI.

Topics covered under the main session headings are as follows:-

Antennas: arrays; adaptive antennas; reflectors and radomes; h.f. antennas; antenna measurements; v.h.f. antennas; numerical techniques, contoured beams; reflector antennas; feeds; scattering and diffraction; conformal and planar antennas; antenna theory and practice.

Propagation: remote sensing and propagation over sea surfaces; effects of ground and atmospheric irregularities on propagation from m.f. to s.h.f.; ionospheric propagation; propagation through rainfall measurements; propagation through rainfall prediction methods; scattering from hydrometeors; earth-space radio propagation.

2 parts, 136 papers, 735 pp., 297 x 210mm, photolitho,
ISBN 0 85296 195 2,
November 1978, soft covers,
£26.00 UK, \$61.00 Americas,

IEE Control Engineering Series 7

Feedback and multivariable systems

D. H. Owens

This theoretical text is concerned with the provision of an analytical and conceptual basis for the analysis and design of unity negative multivariable-output feedback-control systems by using Laplace transforms and frequency-domain techniques. Throughout the text, all system elements are assumed to be described by linear, time-invariant, deterministic state-vector models. Preliminary chapters concentrate on the basic properties of dynamical models. Feedback is introduced in the form of constant-state feedback but attention is focused on output feedback systems and system description using transfer function matrices.

Intermediate chapters discuss performance specifications and design concepts and difficulties by detailed consideration of analytical methods and numerical results for first-second-order multivariable systems, mixed-type systems and dyadic systems. The techniques are based on system decomposition and lead naturally to the general material of later chapters where a detailed treatment commutative control, characteristic loci, dyadic expansions and the inverse Nyquist array is provided plus an outline of sequential design and contraction-mapping algo-

tithms. The final chapter provides a detailed analysis of the asymptotic structure and compensation of multivariable root-loci using dynamic transformation of system inputs and outputs.

October 1978, 320pp., 216 x 135mm, casebound,
ISBN 0906048 03 6, £13.50 UK, \$31.00 Americas,
£15.50 Elsewhere.

OTHER INSPEC SERVICES

SDI
(Selective Dissemination of Information.)
This is a service individually tailored to the requirements and interests of the engineer or research worker. Details of information relevant to the interest profile of the individual subscriber are selected from the data being processed for the INSPEC database. Information is dispatched weekly on 150 mm x 100 mm (6" x 4") cards.

TOPICS
This is an SDI service based on standard profiles. There are over 70 subjects covering high-activity areas of research and development. This is an inexpensive card service designed to alert engineers and researchers to the availability of literature within their subject area.

MAGNETIC TAPES
Tapes containing all the information included in the INSPEC publications are issued twice monthly. They enable the larger research and development organisations to produce their own internal information and current-awareness services.

Physics Abstracts

1st July 19

Summary Classification

The full classification and contents are given at the front of the journal, followed by an **Alphabetical Index** to the subjects covered
